Executive Summary	ix
 Chapter 1. Introduction	
Background	1-1
Purpose of report	1-2
Scope of study	1-3
Industries	1-3
United States	1-4
Australia	1-4
New Zealand	1-4
Market	1-5
Approach of the report	1-5
Time period of study	1-5
Organization	1-6
 Chapter 2. U.S. Industry and Market	
Structure and operation of the U.S. industry	2-1
Live sheep inventory	2-1
Growers	2-4
Lamb packers:	
Number of plants	2-5
Large-volume plants	2-6
Financial experience of U.S. packers	2-8
Operations on lamb meat	2-8
Capital expenditures	2-8
Packer operations:	
Employment and wages	2-10
Productivity	2-10
Costs to process lamb meat	2-11
Domestic production, consumption, and prices:	
Live lamb production	2-11
Lamb meat production	2-12
Domestic consumption	2-13
Lamb meat as a share of total meat consumption	2-13
Costs and returns for sheep operations	2-20
Domestic prices	2-29
U.S. grading system	2-29
Channels of distribution:	
Grower sales of live lambs	2-31
Domestic lamb meat	2-31
Imported lamb meat	2-32
Lamb meat importer questionnaire responses	2-33
Lamb meat purchaser questionnaire responses	2-34
U.S. trade and regulatory measures	2-34
U.S. tariff treatment	2-34
Health and sanitary regulations:	
Rinderpest and Foot-and-Mouth Disease	2-35
The Federal Meat Inspection Act	2-35
Import investigations	2-35

CONTENTS--Continued

	<u>Page</u>
Chapter 2. U.S. Industry and Market--Continued	
Industry concerns	2-37
National Wool Act	2-37
Predators	2-38
Animal Damage Control	2-39
Compound 1080	2-40
Infrastructure	2-41
Grazing sheep and lambs on Federal lands	2-41
Labor	2-44
Price concerns	2-45
Imports	2-45
Imports from Australia	2-49
Imports from New Zealand	2-49
U.S. exports of lamb meat	2-56
U.S. exports of live sheep and lambs	2-56
 Chapter 3. Australian Industry	
Structure and operation of the Australian industry:	
Live sheep inventory	3-1
Growing operations	3-4
Meat packing and processing sector	3-6
Number of establishments, employment, and wage rates	3-6
Local and foreign ownership	3-7
Lamb meat production, consumption, and prices:	
Production	3-7
Consumption	3-11
Prices	3-12
Production costs and profitability:	
Live lamb sector	3-16
Meat packing and processing sector	3-17
Wool production	3-18
Exports:	
Lamb meat and mutton	3-18
Exports to the United States	3-23
Other markets	3-23
Live sheep exports	3-24
Wool exports	3-24
Australian meat identification system	3-26
Australian government assistance:	
Australian Federal Government programs	3-27
Rural Adjustment and Services Sub-program	3-27
The Livestock and Pastoral Sub-program	3-30
Quarantine and Inspection Sub-program	3-30
The Agricultural and Resource Economic Analysis Sub-program	3-30
Public grazing lands	3-31
Measures of assistance	3-31

CONTENTS--Continued

Chapter 3. Australian Industry--Continued	
Australian Federal Government statutory authorities:	
The Australian Meat and Live-stock Corporation	3-32
AUS-MEAT Committee	3-33
Computer Assisted Livestock Marketing	3-33
Lamb and Sheep Meat Promotion Committee	3-34
AMLC expenses and revenues	3-35
Wool International	3-35
WI programs	3-36
WI revenues and wool tax	3-36
Australian Wool Realization Commission	3-37
The Australian Wool Corporation	3-37
Australian State and Territory programs	3-38
 Chapter 4. New Zealand Industry	
Structure and operations of the New Zealand industry	4-1
Sheep inventory	4-1
Growing operations	4-4
Meat packing and processing sector	4-5
Lamb meat production, consumption, and prices:	
Production	4-8
Consumption	4-10
Prices	4-10
Production costs and profitability:	
Live lamb sector	4-12
Meat packing and processing sector	4-18
Wool production	4-18
Exports:	
Lamb meat	4-19
Live sheep exports	4-22
Wool exports	4-23
New Zealand grading system	4-24
New Zealand government assistance	4-24
Programs reviewed under the CVD:	
Livestock Incentive Scheme	4-25
Regional Development Suspensory Loan Scheme	4-25
Expert Assistance Grant Scheme	4-26
The Export Market Development Taxation Incentive	4-26
Export Suspensory Loan Scheme	4-27
Export Programme Grant Scheme/Export Programme Suspensory Loan Scheme	4-28
Other New Zealand programs	4-28
Public Good Science Fund	4-29
Technology for Business Growth Scheme	4-30
Public grazing lands	4-30
New Zealand Federal Government statutory authority:	
New Zealand Meat Producers Board	4-31
Meat-Planning Council	4-32

5-8. Multipliers for U.S. sheep-related markets under five simulations	5-43

EXECUTIVE SUMMARY

Background

The Commission instituted the subject investigation on November 1, 1994, following receipt of a request on October 12, 1994, from the United States Trade Representative. The investigation is being conducted under section 332(g) of the Tariff Act of 1930 (19 U.S.C. 1332(g)) and under the authority delegated by Executive Order 12661 for the purpose of investigating the competitive conditions affecting the U.S. lamb industry.¹

Lamb meat is derived from young sheep, usually under one year in age. For purposes of this study, the U.S. sheep and lamb industry may be described as consisting of lamb growers and feeders, packers, and processors. U.S. sheep and lamb growers may be divided into categories including (1) purebred breeders (that is, those who keep purebred sheep and sell rams for breeding purposes), (2) commercial market lamb producers (those who maintain flocks of sheep for the production of lambs that are sent directly to slaughter or feedlots), and (3) commercial feedlot operators (those who maintain feedlots where lambs are fed concentrates until they reach slaughter weight). Lamb packers are companies that slaughter lambs, regardless of whether they process lamb meat. Lamb meat processors fabricate carcasses into primal, subprimal, or retail cuts. Lamb meat is distributed to the ultimate consumer through hotel, restaurant, and institutional (HRI) outlets and through retail grocery chains and butcher shops.

Some domestic interests have expressed concern about lamb meat imports that increased from 6.7 percent of domestic consumption in 1990, to 11.5 percent in 1994. Also, some domestic sheep and lamb growers contend that their sector has been adversely affected by recent U.S. government actions. For example, payments to growers under the National Wool Act of 1954 are estimated to have accounted for between 18 and 23 percent of annual gross returns to growers between 1990 and 1993; these payments are to end with the 1995 production season. Other U.S. Government actions have included restrictions on predator controls, including the termination of the U.S. Department of Agriculture (USDA), Animal Damage Control (ADC) program on lands administered by the U.S. Department of the Interior (USDI), Bureau of Land Management (BLM) effective on April 6, 1993. Growers have also noted other restrictions related to grazing on public lands administered by the BLM and the USDA Forest Service (FS). They further contend that regulations administered by the Immigration and Naturalization Service (INS) under authority of the Immigration Reform and Control Act of 1986 have made it difficult to employ shepherds from other countries.

Increasing concentration in the lamb slaughtering and processing sector, concomitant with a decline in the number of packing plants, has increased

¹ The information and analysis provided in this report are for the purpose of this report only. Nothing in this report should be construed to indicate how the Commission would find in an investigation concluded under statutory authority covering the same or similar subject matter.

concerns on the part of growers. Indeed, growers have expressed a concern about a general decline in the infrastructure of the U.S. sheep sector, citing declining market outlets and shortages of specialized labor. They have also noted that the relatively small size of the U.S. lamb sector impedes investment and research by such supporting industries as the animal medicine industry.

Findings

United States

- In the United States, most sheep and lambs are meat-type animals kept mainly for the production of lambs for meat or dual purpose breeds kept both for the production of lambs for meat and wool. The U.S. sheep sector, located primarily in the Western States and in the Corn Belt, has been in a long-term decline as measured by the number of animals or growers and by lamb meat production. However, prices for lambs generally rose during 1990-94.
- The U.S. sheep and lamb population declined by 22 percent, from 11.4 million animals in January 1, 1990, to 8.9 million animals in January 1, 1995. The number of sheep-raising operations in the United States declined by 20 percent, from 108,940 in 1990 to 87,350 in 1994. The Western States accounted for 79 percent of the total U.S. sheep and lamb population as of January 1, 1995; the Corn Belt accounted for 15 percent.
- During 1990-94 the annual average price for live lambs rose irregularly from \$55.42 per 100 pounds (cwt) to \$66.77, or by 20 percent. The rise in price corresponded with a general decline in lamb meat production, which fell by 13 percent, from 346 million pounds in 1990 and 1991 to 300 million pounds in 1994. The price pattern for lamb carcasses was similar to that for live lambs. During 1990-94, the annual average price for lamb carcasses rose by 22 percent, from \$121.47 per cwt to \$147.62. Some domestic sheep and lamb growers have expressed concern about the farm-retail price spread between live lamb and lamb meat. This spread may reflect to some extent a less efficient U.S. lamb meat processing and distribution sector in comparison with other meat sectors, such as beef and poultry.
- U.S. imports of fresh, chilled, or frozen lamb meat are subject to several health and sanitary measures. Virtually all U.S. imports of lamb meat are from Australia and New Zealand. Frozen bone-in cuts of lamb meat represent the bulk of lamb meat imports and reflect transportation cost considerations. The share of imports accounted for by frozen products rose from 69 percent in 1990 to 80 percent in 1994; fresh or chilled lamb meat made up the remaining 20 percent. During 1990-94, annual U.S. imports of fresh, chilled, or frozen lamb meat increased irregularly from

24.9 million pounds, valued at \$31.3 million, to 38.7 million pounds, valued at \$48.7 million.

- Imports from Australia rose 70 percent in terms of volume during this period. U.S. imports of Australian lamb amounted to 13.4 million pounds, valued at nearly US\$14 million, in 1990, compared with 22.8 million pounds, valued at US\$26.5 million, in 1994. Imports from New Zealand rose 38 percent in terms of volume from 1990 to 1994. More than 11.5 million pounds, valued at US\$17.3 million, were imported in 1990, compared with the more than 15.9 million pounds, valued at US\$22.2 million, imported in 1994.
- During the 1980s, the domestic lamb sector filed three petitions with the United States International Trade Commission (USITC) alleging that imports of lamb meat from New Zealand were being subsidized and/or were being sold in the United States at less than fair value (LTFV). One petition was withdrawn and the investigations associated with the other petitions resulted in USITC determinations of no injury or threat of injury to a domestic industry. A fourth petition alleging that imports of lamb meat were being subsidized by the Government of New Zealand was filed with the U.S. Department of Commerce (DOC) in 1985. This petition resulted in a countervailing duty order (CVD) on imports of lamb meat from New Zealand entering on and after June 25, 1985.
- Eight final administrative reviews of the CVD order on lamb meat from New Zealand have been completed by the DOC. The CVD (subsidy) amounts decreased for each annual review, and the total bounty or grant was found to be *de minimis* for all firms for the review period April 1, 1990, through March 31, 1991. A subsequent final review for the period April 1, 1991, through March 31, 1992, also determined *de minimis* CVD amounts for all firms.
- On May 22, 1995, the DOC published a notice of its final determination that the subsidy for the period April 1, 1992, through March 31, 1993, was *de minimis* for all firms. In the same notice, the DOC reported its final determination that the Government of New Zealand had met the requirements for revocation of the CVD order. Accordingly, on May 22, 1995 (60 F.R. 27082), the DOC announced a revocation of the CVD order.

Australia

- In Australia, about 75 percent of the sheep are wool-type (animals kept mainly for the production of wool), unsuited to produce lambs for meat. During 1990-94 (as of March 31), the number of sheep and lambs in Australia fell from 170 million animals to 134 million. The decline in Australian sheep numbers reflects

declining profitability of wool production in Australia during the early 1990s and adverse production conditions resulting from drought.

- Exports of lamb meat have become increasingly important to the Australian sheep sector in recent years, and the United States is an important market. During FY 1990-94 (year ended June 30), Australian exports of lamb meat rose irregularly from 87.6 million pounds (shipped weight), valued at US\$84 million, in 1990, to 127.4 million pounds, valued at US\$134 million, in 1994. Exports also rose irregularly as a share of Australian lamb meat production from 14 percent in 1990 to 23 percent in 1994, reflecting decreased production as well as irregularly rising exports.
- The United States was the largest single market for Australian exports of lamb meat in terms of quantity during 1990-94. In terms of value the United States was the largest single market for Australian lamb meat exports in all years except 1991 and 1992, when the value of exports to the European Union and Japan both exceeded those of the United States. The United States accounted for 19 percent of the quantity and value of Australia's exports of lamb meat in 1994.
- Australian Federal Government involvement in the sheep sector appears to be largely through wool-related programs or general agriculture programs rather than through programs that are specifically limited to live lambs or lamb meat. Most Australian Federal Government programs related to sheep production are administered by the Department of Primary Industries and Energy by subdivisions, or "Sub-programs," which appear to be similar to agencies of the USDA. The Wool Industry Supplementary Payment Scheme was established by the Australian Federal Government in March 1991 after the abolition of the Reserve Price Scheme, a program to provide price stability for Australian wool. The announced purpose of this program was to compensate wool growers for the difference between the market price for wool and the Reserve Price for wool sold between February and June 1991. The total payment to sheep growers from the Wool Industry Supplementary Payment Scheme was AUS\$311 million, including AUS\$300 million of Australian Federal Government funds. This program was terminated in 1992.

New Zealand

- In New Zealand, most sheep are dual-purpose animals. Although New Zealand sheep growers benefit from nearly ideal climatic and grazing conditions, the sheep inventory declined from 57.9 million animals in 1990 to 50.1 million animals in 1994, continuing a long-term decline from 70.3 million in 1982. The decline in sheep

numbers reflects in part lower wool prices and the continued movement, especially in northern regions from sheep to dairy cattle, beef cattle, and forestry.

- Meat processing is handled mainly by a number of private-sector companies, some of which are owned by producer cooperatives. Reportedly, inefficient plants have been closed in recent years; others have been modernized, and new efficient plants have opened. Significant gains reportedly have been made in productivity in recent years, and per head processing costs have been declining. During 1994, two large meat-processing companies went into receivership.
- Between 95 and 97 percent of New Zealand's annual lamb meat production during 1990-94 was exported. New Zealand lamb meat exports increased from 732 million pounds in 1990 (year ending September 30) to 838 million pounds in 1992, then dropped to 747 million pounds in 1993, and rose to 827 million pounds in 1994. The largest market for New Zealand lamb meat exports is the European Union (EU), which accounted for 52 percent (by quantity) of New Zealand's exports in 1994. New Zealand sheepmeat (mutton and lamb) exports into the EU are subject to import quotas under various voluntary restraint agreements. Other major markets include the Middle East, Papua New Guinea, Fiji, North America, and Asia. U.S. imports of New Zealand lamb meat were equivalent to 2.5 percent of total New Zealand lamb meat exports and to about 5 percent of U.S. consumption in 1994.
- Government assistance to New Zealand agriculture has fallen significantly since the 1980s. Government funded research, primarily related to animal and plant health concerns, and disaster relief are the major areas in which the Government provides assistance. The New Zealand Government made a commitment in 1991 to maintain a minimum level of funding (NZ\$255 million per year) for its investment in research through the Public Good Science Fund. Approximately NZ\$13 million of this funding is allocated to sheep production.

Comparative Analysis

- Available data suggest that live lamb raising, and thus, lamb meat production are generally lower in cost in New Zealand and Australia than in the United States, and likely reflect, at least in part, different management practices of live lamb growers.
- Mature sheep typically are fed on pasture in the United States, but, in addition, they receive some concentrates (usually grains) and protein supplements. In New Zealand and Australia sheep and lambs are fed almost exclusively on pasture and limited amounts of hay. In the United States, grains and protein concentrates

accounted for about 20 percent of estimated total variable cash expenses annually during 1989-94. Hay accounted for an additional 10 percent of estimated total variable cash expenses. Total hay costs are believed to be lower in New Zealand and Australia, reflecting the longer pasture seasons in those countries.

- U.S. lamb packers also pay a higher price for lambs than do their counterparts in New Zealand and Australia. Lower prices for live animals in Australia and New Zealand provide a cost advantage to packers in those countries relative to their counterparts in the United States.
- The U.S. sheep and lamb packing sector is rather concentrated and has become increasingly profitable in recent years. The Australian meatpacking sector is relatively inefficient. The competitive position of New Zealand's meatpacking sector, especially lamb, has suffered from overcapacity and high debt levels, and, in recent years some plants have closed.
- The number of large U.S. lamb packing plants has declined from 11 in 1991 to 7 in 1995. Eight large plants accounted for 83 percent of U.S. lamb slaughter in 1994. Packers responding to the Commission's questionnaire (accounting for over 86 percent of domestic production) reported their operating income as a share of net sales ranged from 1.4 percent in 1993 to 3.5 percent in 1994. Operating income was 2 cents per-pound in 1992 and 1993 and 6 cents in 1994.
- In a private study commissioned by the Australian Meat and Live-stock Corporation, the Australian meat packing sector, while marginally profitable, was found to be less efficient than counterparts in a number of other countries, including New Zealand and the United States. Although, Australian packers obtain low-cost animals, they have relatively high wage rates, restrictive labor practices, and strikes.
- The New Zealand lamb packing sector benefits from relatively low-cost animals for packing, economies of scale, and a relatively concentrated geographic area which limits transportation costs. In August 1994, several lamb packing plants, representing about 30 percent of the capacity of the North Island of New Zealand, closed, sharply reducing an overcapacity problem. In the South Island one plant was closed because of a bankruptcy.
- Domestic lamb carcasses and the cuts derived from them are typically larger than imported carcasses and cuts. The average U.S. carcass weighed 63 pounds; New Zealand carcasses averaged 33 pounds; and Australian averaged 40 pounds in 1994. Commission questionnaires sent to lamb meat purchasers requested comparisons between imported and domestic lamb meat relating to such factors as product quality, palatability, fat content, consistency of product specifications, shelf life, availability, packaging, and

servicing. The most common response to the aforementioned factors was that the imported and domestic products are comparable.

- Domestic lamb meat, especially at retail outlets is typically sold fresh or chilled, whereas imported meat is often sold frozen. Some consumers prefer fresh meat because it is perceived to be higher in quality. The shelf life of frozen lamb meat is obviously an important consideration for Australian and New Zealand lamb meat in the U.S. market since three weeks transit time must be allowed for surface transportation.
- In the United States lambs are typically fed concentrates in addition to pasture and milk from their mothers. Such lambs are referred to as "fed lambs." In New Zealand, lambs are fed only on pasture and milk from their mothers, and in Australia concentrate feeding is minimal. Some consumers contend that meat derived from grass-fed lamb is "gamier" and has a stronger flavor and aroma than meat derived from grain-fed lambs. According to hearing testimony, responses to the Commission's questionnaires, and fieldwork, the preference of individual consumers in the U.S. market between large or small-sized cuts, fresh or frozen form, and grain-fed or grass-fed lamb appears to vary considerably.
- Price appears to be an important factor influencing purchase decisions for U.S., Australian, and New Zealand lamb. The Commission's questionnaire asked purchasers to rank the importance of various factors in their decision to purchase U.S., Australian, and New Zealand lamb meat. Quality was reported to be very important in 16 of 18 responses, availability was ranked as very important in 15 responses, and price and price consistency each were ranked as very important in 10 responses. No respondent purchasers of U.S., Australian, or New Zealand lamb meat ranked quality, availability, price, and price consistency as somewhat important or unimportant.
- The relative prices of domestic and imported lamb meat fluctuated significantly during 1990-94 according to information obtained from the Commission's questionnaires to purchasers and importers. The relative prices of domestic and imported lamb meat vary depending on the cut and form (fresh or frozen) under consideration. Also, the price of imported lamb meat is influenced by transportation cost. The fresh or chilled imported meat is flown to the United States at a cost of US\$0.85 per pound. Frozen lamb is typically sent to the United States by ship at a cost of US\$0.17 per pound.
- During 1994 Australian and New Zealand fresh racks and fresh legs, and New Zealand fresh carcasses were higher priced per pound than their domestic counterparts according to information obtained from the Commission's questionnaires to purchasers and importers. During May-December, fresh Australian and New Zealand shoulders

were reported to be lower priced per pound than domestic fresh shoulders.

- During 1994 New Zealand frozen racks were reported to be higher priced than domestic fresh or frozen racks. However, for all other frozen imported lamb meat (where price comparisons were available) both Australian and New Zealand were reported to be lower priced than their domestic fresh or frozen counterparts.
- An econometric model was developed to illustrate the competitive conditions affecting the U.S. sheep-related markets. Model results suggest that increased imports displaced U.S.-produced lamb quantities to an extent that apparently falls between the range of opinions expressed by U.S. and foreign producer representatives. Results suggest that imports displaced some U.S.-produced lamb quantities, but such displacement typically has not significantly influenced price.
- Simulation results from the econometric model suggest that increasing U.S.-produced quantities displace imports to a greater extent than increasing imports displace U.S.-produced lamb. According to model results, expanding U.S. quantities of lamb produced and consumed appear to displace lamb meat imports; historically, increases in U.S. quantity result on average, in a fall in U.S. lamb price, a rise in U.S. wool production, a decrease in the price of U.S.-produced wool, and a large drop in lamb meat imports. Model results also suggest that elimination of Wool Act benefits will likely result in some contraction of the U.S. industry.

CHAPTER 1: INTRODUCTION

Background

This investigation is concerned with the competitiveness of U.S. and imported lamb in the U.S. market. The domestic industry has been in a long-term decline since the 1940s but still supplies almost 90 percent of the U.S. market. In recent years, competitive pressures from the scheduled termination of the National Wool Act of 1954 (payments under which have accounted for about one-fifth of total grower returns), a declining consumption and competition from beef and poultry, and a declining industry infrastructure have challenged the U.S. industry. More restrictive environmental regulations relating to predator controls, restrictive rules concerning grazing stock on public lands, and labor laws affecting the use of shepherds from other countries have forced producers to make decisions about new operating practices. In addition, U.S. imports of lamb meat increased from 25 million to 39 million pounds during 1990-94 and increased their share of domestic consumption from about 7 percent to 11 percent.

International trade in the sheep and lamb sector consists primarily of meat; live animals are relatively expensive and impractical to ship. Together, Australia and New Zealand account for about 75 percent of the world's estimated exports of lamb meat, and these two countries supply virtually all U.S. imports of lamb meat, which amounted to about \$49 million in 1994. In 1994, the U.S. market absorbed about one-sixth of total Australian lamb meat exports and less than 3 percent of New Zealand exports.

Domestic sheep and lamb producers have for many years expressed concerns about imports of lamb meat. As a result of petitions filed by the domestic industry, the U.S. International Trade Commission (USITC) conducted a countervailing duty investigation on lamb meat imports from New Zealand in 1981,¹ and antidumping and countervailing duty investigations concerning such imports from New Zealand in 1984.² A fourth petition, in which the USITC did not participate,³ alleged that imports of lamb meat were being subsidized by the Government of New Zealand and was filed with the U.S. Department of Commerce (DOC) in 1985. This petition and subsequent investigation resulted in countervailing duties being collected on U.S. lamb meat imports from New Zealand during June 25, 1985-March 31, 1990. Pursuant to Section 1937 of the

¹ U.S. International Trade Commission (USITC), *Lamb Meat From New Zealand*, investigation No. 701-TA-80(P), publication 1191, Nov. 1981.

² USITC, *Lamb Meat From New Zealand*, investigation Nos. 701-TA-214(P) and 731-TA-188(P), publication 1534, June 1984.

³ The investigation was conducted under section 303 of the Tariff Act and no injury determination was required prior to the issuing of a countervailing duty order because New Zealand was not a "country under the Agreement" within the meaning of section 701(b) of the Tariff Act and because the merchandise the subject of the investigation was dutiable.

Omnibus Trade and Competitiveness Act of 1988,⁴ the USITC conducted a 2-year monitoring and an investigation on U.S. lamb meat imports during 1988-89.⁵

Purpose of the Report

On October 12, 1994, the United States Trade Representative (USTR) requested that the Commission investigate the competitive conditions affecting the U.S. lamb industry and provide a report setting forth the results of the investigation.⁶ The USTR requested that the report focus on the period 1991-94 and be similar in structure to the previous Commission 332 report on the lamb industry: *U.S. Imports of Lamb Meat: Final Monitoring Report*.⁷ Specifically, the Commission was asked, to the extent practical, to include in its report:

- (1) U.S. and foreign industry profiles; and, with respect to Australia and New Zealand, such information as the Commission develops concerning whether there is government assistance to the industries in these countries;
- (2) information concerning U.S. and foreign markets;
- (3) U.S. imports and exports;
- (4) U.S. market penetration;
- (5) price comparisons of domestic and imported lamb meat; and
- (6) a discussion of other factors bearing on competitive conditions and trade that affect the U.S. lamb industry.

The Commission instituted its investigation on November 1, 1994. Public notices of the investigation, hearing, and rescheduling of the public hearing were given by posting copies of the notices at the Office of the Secretary, U.S. International Trade Commission, Washington, DC, and by publishing the notices in the *Federal Register* of November 9, 1994, (59 F.R. 55854) and

⁴ Section 1937 was a conference agreement resolving U.S. House of Representative and U.S. Senate differences concerning lamb meat imports. A Senate amendment authorized import quotas for lamb meat, but the House bill had no such provision.

⁵ USITC, *U.S. Imports of Lamb Meat: Final Monitoring Report*, investigation No. 332-264, publication 2345, Dec. 1990.

⁶ A copy of the request from the USTR is included in appendix A.

⁷ USITC, *Final Monitoring Report*, publication 2345, Dec. 1990. This report covered the period 1985-89 and reviewed the industries in the United States, Australia, and New Zealand.

February 17, 1995 (60 F.R. 9396).⁸ A public hearing in connection with this investigation was held on April 6, 1995, in Washington, DC.⁹

Scope of Study

Lamb meat is the primary focus of this investigation and is derived from a young male or female sheep generally less than a year in age.¹⁰ Lamb meat is pinkish red in color whereas the meat of an older sheep (mutton) is dark red. The lamb carcass is typically divided (broken) into so-called prime (or primal) or wholesale cuts. These cuts are then generally further divided into so-called actual or retail cuts. The prime cuts of lamb and retail cuts are shown in appendix D. Domestic lamb carcasses and the cuts derived from them are generally larger than imported carcasses and cuts. Domestic lamb meat is often sold fresh or chilled, whereas imported meat is often sold frozen.

Live lambs and sheep are included in this study because they are the only source for lamb meat and in the United States, the primary purpose for which these animals are produced. Sheep and lambs produce both wool and meat, and growers must decide whether to produce meat-type or wool-type sheep. In the United States, wool is a secondary product to the production of lamb meat.¹¹ U.S. sheep and lamb growers received wool incentive payments (under the National Wool Act of 1954), which accounted for between 18 and 23 percent of annual gross returns during 1990-93. The wool incentive program will be eliminated after the 1995 marketing season, thus affecting growers' revenue. In Australia, live sheep and lambs are kept primarily for wool production, and, in New Zealand, live sheep and lambs are kept for both wool and meat production. Thus, data on wool production and trade of wool are used in the analysis of the overall viability of the entities that produce sheep.

Industries

The U.S. sheep and lamb industry consists of lamb growers and feeders and lamb meat packers and processors. The New Zealand and Australian industries consist primarily of growers, packers, and processors (but not feeders).¹² The Australian and New Zealand lamb industries are both significantly larger than the U.S. industry. U.S. lamb meat production is about half the volume of Australia's and about one-third of New Zealand's. In addition, the Australian and New Zealand lamb industry infrastructure is generally more extensive and developed than the U.S. industry's and partially

⁸ A copy of the notices of the Commission's investigation and hearing and the rescheduling of the hearing are included in appendix B.

⁹ Appendix C contains a witness list for the public hearing.

¹⁰ The lamb meat included in this study is classifiable under HTS subheadings 0204.10.00, 0204.22.20, 0204.23.20, 0204.30.00, 0204.42.20, and 0204.43.20.

¹¹ The value of wool shorn declined from the equivalent of 14 percent of growers' sales in 1990, to 9 percent in 1994.

¹² These industry terms are discussed in greater detail in chapter 2.

reflects much larger sheep flocks (the Australian flock is about 15 times larger than the U.S. flock, and New Zealand's is about 5 times larger).

United States

The U.S. sheep and lamb inventory totaled about 9 million animals as of January 1, 1995. Sheep and lambs are raised throughout the United States but are concentrated in the West, where in many areas they are the only suitable agricultural crop. There were eight meatpacking plants in the United States that slaughtered the majority of U.S. sheep and lambs in 1994. U.S. lamb meat production totaled 300 million pounds in 1994, and accounted for less than 1 percent of U.S. red meat consumption. U.S. exports of lamb meat are negligible. U.S. wool production was valued at about \$52 million in 1994. The U.S. sheep population is estimated to account for about 1 percent of the world's total, and U.S. production of lamb meat is estimated to account for about 2 percent of world production. The U.S. sheep and lamb sector is relatively small when compared with the U.S. cattle and swine sectors. In 1994, the sheep and lamb sector's output was valued at \$567 million and made up about 1 percent of total U.S. meat animal sales.

Australia

The Australian sheep inventory totaled 134 million in 1994. Major sheep-raising states include New South Wales, Western Australia, Victoria, and South Australia. In Australia, about three-quarters of the sheep industry is maintained for the production of wool. Australia is the world's leading producer of wool, with production totaling nearly US\$2 billion in the 1993/94 marketing year. Lamb meat production totaled 584 million pounds in 1994 with over 75 percent consumed domestically. Lamb meat consumption accounted for 16 percent of red meat consumption in 1993. Exports accounted for 23 percent of Australian lamb meat production in 1994, with the United States being the leading market.

New Zealand

The sheep inventory in New Zealand totaled 50 million animals in 1994. Sheep are raised throughout New Zealand, and most are dual-purpose breeds producing both wool and meat. In recent years, the New Zealand lamb packing sector has undergone restructuring, with the closing of several plants and modernization of others. It is estimated that in early 1995 there were 33 large lamb packing plants. Lamb meat production totaled 849 million pounds in 1994, and over 95 percent was exported. The European Union (EU) is the largest market for New Zealand lamb meat accounting for 52 percent, by quantity, of total exports in 1994. Lamb meat accounted for about 9 percent of red meat and poultry consumption in 1994. New Zealand is the world's second largest wool producer, with production totaling US\$508 million in the marketing year 1993/94.

Market

There are two market segments in the United States in which domestic and imported lamb meat compete, namely, in the retail segment and in the hotel, restaurant, and institutional or food service segment (identified as HRI). Because imports of live lambs are negligible, no additional competition exists. Domestic lamb meat is generally marketed fresh, whereas imports are generally marketed frozen. In 1994, frozen lamb meat accounted for 80 percent of U.S. lamb meat imports and fresh or chilled lamb meat accounted for the remainder.

Lamb meat is distributed to the retail consumer by supermarkets, grocery stores, and butcher shops. Retail sales generally include a wide range of cuts, such as whole or semi-boneless legs, loin chops, shanks, shoulder chops, and rib racks. It is estimated that approximately 70 percent of domestic lamb meat is marketed through U.S. retail outlets, compared with 25 percent of New Zealand lamb. Industry sources report that significant quantities of Australian lamb are marketed also through retail outlets, however, the actual percentage is not known.¹³ The HRI market segment generally demands lamb meat that has been further processed (e.g., "chef ready") and usually consists of higher priced items, such as racks and loins. About 25 percent of domestic lamb is marketed through the HRI trade compared with nearly 75 percent of New Zealand lamb meat. It is estimated that about 35 percent of Australian frozen lamb meat is suitable for the HRI market.¹⁴

Approach of the Report

This report analyzes the competitive conditions of the lamb industry through an examination of the supply and demand conditions for live lambs and lamb meat in the United States, Australia, and New Zealand during 1990-94. Information on changes in sheep inventories, lamb meat production and consumption, lamb meat imports and exports, the cost of major production inputs, lamb meat marketing and quality characteristics, and governmental policies is examined. The information in the report is from submissions and testimony presented at the Commission's public hearing, domestic and foreign fieldwork, responses to the Commission's questionnaires, literature searches, U.S. Department of Agriculture (USDA) and State Department telegrams, telephone interviews, previous Commission studies, and other sources. Domestic fieldwork was centered in Colorado, Wyoming, Texas, and New York. Foreign fieldwork included trips to Australia and New Zealand.

Time Period of Study

The USTR letter asked that the Commission focus its data collection and analysis on the period 1991-94 and that the report be similar in structure to

¹³ Council for AMLC, telephone conversation with USITC staff, June 7, 1994.

¹⁴ Posthearing brief of the AMLC, p. 10.

the last Commission's report on lamb covering the 1985-89 period.¹⁵ Whenever practicable, this report provides general information for the 1990-94 period so as to provide a continuum of data for both of the reports.

Organization

Chapter 2 describes the structure of the U.S. lamb industry, the U.S. grading system, production, consumption, markets for domestic and imported meat, regulatory measures, wool, industry concerns and information on U.S. trade. Chapters 3 and 4 describe the structures of the Australian and the New Zealand industries, respectively. Chapter 5 compares and analyzes the factors that affect the competitive position of the domestic lamb meat industry with respect to the Australian and New Zealand industries; including a comparison of lamb meat prices, cost structures, and factors affecting U.S. and foreign lamb supply and demand. In addition, this chapter discusses the results of the application of a data-oriented econometric model (vector autoregression) which was used to gauge the significance of imports in the U.S. market. Statistical tables are presented upon their first reference.

¹⁵ USITC, *Final Monitoring Report*, publication 2345, Dec. 1990.

CHAPTER 2: U.S. INDUSTRY AND MARKET

Structure and Operation of the U.S. Industry

As defined for the purpose of this study, the U.S. lamb industry consists of lamb growers and feeders and lamb meat packers and processors. Figure 2-1 illustrates the channels of distribution for lamb from breeding to final consumption. Lamb growers include shearers who maintain flocks of sheep for the production of lambs, including purebred and commercial flocks. Feedlot operators maintain feedlots where lambs are fed on grain or other concentrates until they reach slaughter weight. Lamb packers are companies that slaughter lambs, regardless of whether or not they process lamb meat.¹ Lamb meat processors fabricate carcasses into primal, subprimal, or retail cuts.

Consumers of lamb meat include retailers (mostly grocery stores) and hotels, restaurants, and institutions (HRI) that prepare food for consumption. These establishments generally purchase lamb meat from wholesalers, breakers,² or distributors. However, processors or packers may also sell directly to retailers.

Live Sheep Inventory

The location of the U.S. sheep inventory is shown in figure 2-2. Although sheep are found throughout the United States, sheep and lamb production is concentrated in the Western United States. Western States³ accounted for 79 percent of the total U.S. sheep population as of January 1, 1995. In contrast, the Corn Belt⁴ accounted for only 15 percent of the total U.S. sheep population as of January 1, 1995. The U.S. sheep population declined by 22 percent from January 1, 1990, to January 1, 1995, as shown in the following tabulation (in 1,000):⁵

<u>U.S. sheep and lamb population</u>			
1990 . .	11,363	1993 . .	10,906
1991 . .	11,200	1994 . .	9,742
1992 . .	11,507	1995 . .	8,895

² Breakers cut carcasses into cuts for resale to retail stores and food service outlets. Sheep Industry Development Program, Inc., *Sheep Production Handbook*, 1988, p. MKT-8.

³ For purposes of this report, the Western rangelands are considered to be located in Arizona, California, Colorado, Idaho, Montana, Nevada, New Mexico, North Dakota, Oklahoma, Oregon, South Dakota, Texas, Utah, Washington, and Wyoming.

⁴ The Corn Belt consists of the States of Illinois, Indiana, Iowa, Kansas, Michigan, Minnesota, Missouri, Nebraska, Ohio, and Wisconsin.

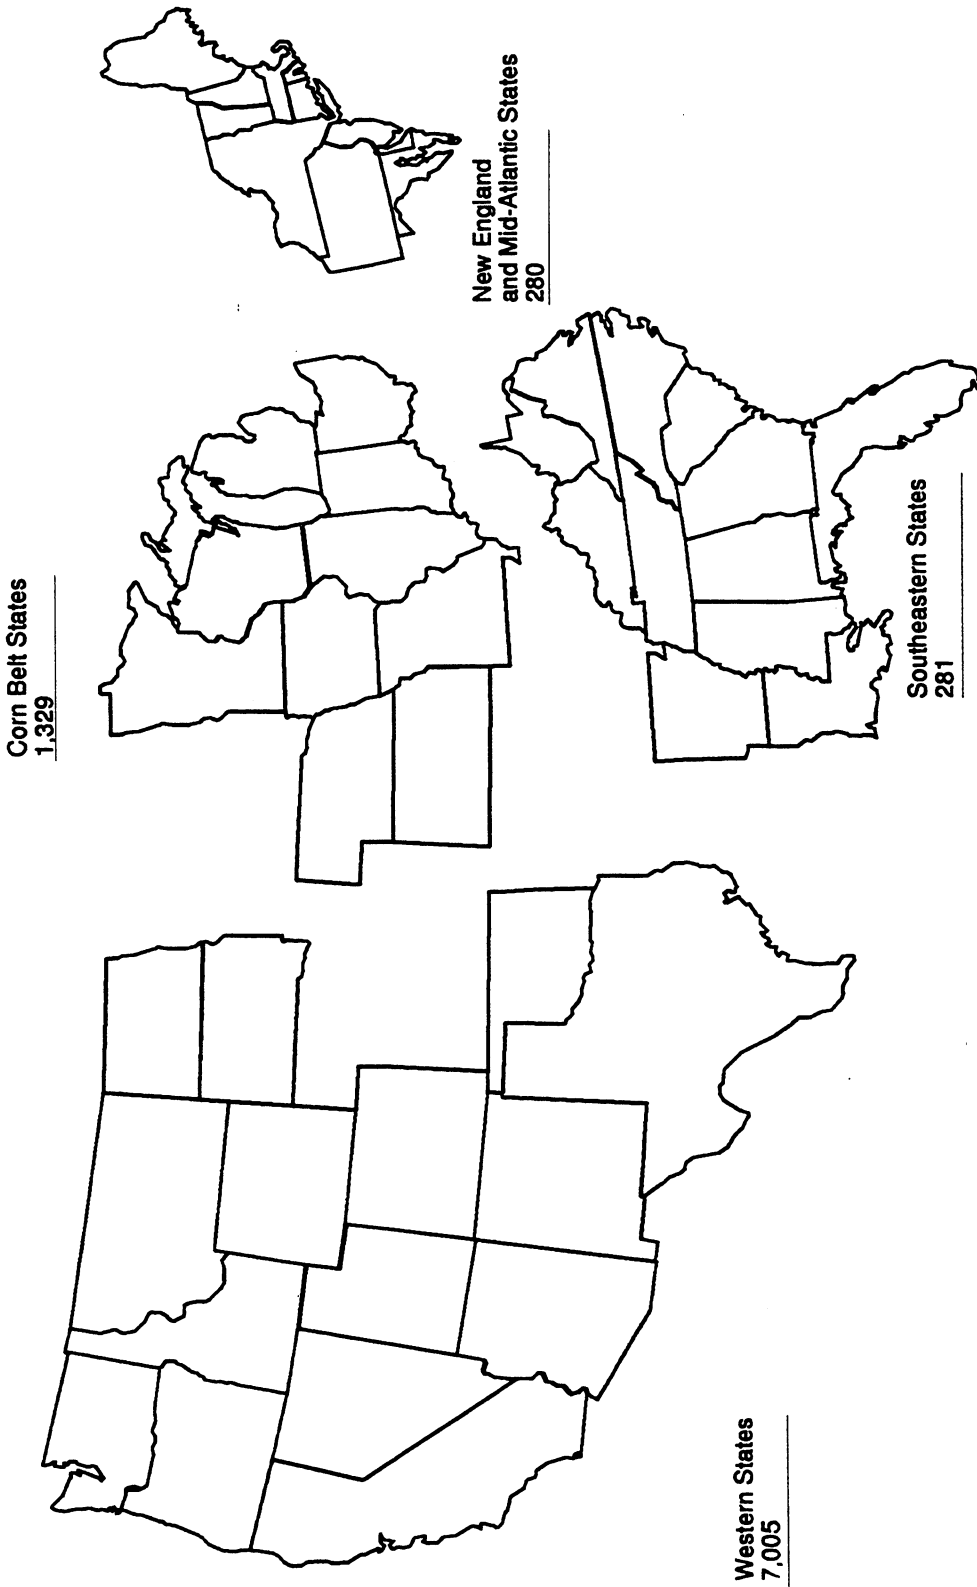

⁵ This decline is a continuation of a long-term trend beginning in 1942.

Figure 2-1
Sheep and meat of sheep: Structure of the U.S. Industry

Figure 2-2
Regional location of U.S. sheep inventory as of January 1, 1995
1,000 animals

Source: Compiled from official statistics of the U.S. Department of Agriculture.

Most growers have small flocks of sheep (50 or fewer animals referred to as farm-flocks) and raise sheep as a secondary enterprise.⁶ However, about one-third of the growers in the rangelands of the Western States have relatively large flocks (50 or more animals referred to as range-flocks) and specialize in sheep.⁷ Officials of the National Lamb Feeders Association report that there are probably only about 100 large-volume lamb feedlots in the United States, although there are many small-volume feedlots. Sheep and lamb feeding tends to be concentrated in a few States as shown in the following tabulation⁸ (1,000 animals):

<u>State</u>	<u>1990</u>	<u>1991</u>	<u>1992</u>	<u>1993</u>	<u>1994</u>
California	225	280	285	305	320

Kansas	102	63	48	82	60
All other	<u>495</u>	<u>571</u>	<u>566</u>	<u>534</u>	<u>456</u>
Total	1,762	1,730	1,830	1,877	1,839

Growers

U.S. sheep and lamb growers may be divided into categories including:⁹ (1) purebred breeders (that is, those who keep purebred sheep and sell rams for breeding purposes;¹⁰ (2) commercial market lamb producers (those who maintain flocks of sheep for the production of lambs that are sent directly to slaughter; or to (3) commercial feedlot operators (those who maintain feedlots where lambs are fed concentrates until they reach slaughter weight). Some growers engage in more than one sheep-raising activity. Some market lamb producers retain title to their lambs that are placed in feed lots by having them fed for a fee or having them fed in some type of partnership with the commercial feedlot operator.

⁶ Robert E. Taylor, *Scientific Farm Animal Production: An Introduction to Animal Science*, 4th ed., (New York: Macmillan Publishing Co., 1992), p. 47.

⁷ Ibid.

⁸ Animals in feedlots as of January 1. USDA, National Agricultural Statistics Service (NASS), *Sheep and Goats*, various issues, 1991-95.

⁹ The following description of grower categories was adapted from Taylor's *Scientific Farm Animal Production*, pp. 48-49.

¹⁰ Growers often expand the number of animals in their flocks or replace ewes no longer suitable for breeding purposes by retaining the best ewe lambs from each year's crop. Since the productive life of a ewe is typically 4 to 5 years, about 20 to 25 percent of the ewe lambs from each year's crop must be retained to maintain breeding herd numbers.

The number of sheep-raising operations¹¹ in the United States declined steadily from 108,940 in 1990 to 87,350 in 1994, or by 20 percent. Many operations consist of only a few sheep and belong to part-time or hobby farmers. The live sheep and lamb sector is thought to be relatively unconcentrated, with even the largest volume operations accounting for only a small share of total production. The Western States and the Corn Belt account for 40 and 39 percent, respectively, of U.S. sheep operations. The remaining operations located primarily in the Northeastern United States and border regions of the Southeastern United States.¹² In many areas of the Southwest and West, forage is the only suitable agricultural crop because of topography, rainfall, and soils, and the only practical use for the forage is as a feed for ruminant animals. Domestic industry officials report that, because of the types of forage and ground cover and forage availability, some areas that do not lend themselves well to cattle production raise sheep as one of the few production alternatives.¹³

Lamb Packers

Number of plants

Federally inspected (FI) packing plants accounted for about 96 percent of sheep and lamb slaughter annually in the United States during 1990-94. The total number of FI sheep and lamb slaughtering plants declined from 815 in 1990 to 652 in 1994, or by 20 percent.¹⁴

FI plants with a capacity to slaughter 100,000 or more sheep and lambs annually accounted for 80 percent or more of sheep and lamb slaughter during 1991-94 as shown in the following tabulation:

<u>Year</u>	<u>Number of large volume plants</u>	<u>Percent of slaughter</u>
1991 . . .	11	85
1992 . . .	10	80
1993 . . .	9	83
1994 . . .	8	83

Although the number of large-volume plants declined from 11 to 8 during 1991-94, the percent of slaughter remained fairly constant. In addition, the

¹¹ According to USDA, an operation is any place that has one or more sheep on hand at any time during the year.

percent of commercial slaughter accounted for by the 4 largest lamb packing companies increased from 70 percent in 1990 to 78 percent in 1992.¹⁵

Some vertical integration exists in the lamb sector since some packers operate lamb feedlots. The Packers and Stockyards' Administration of the USDA reports statistics that include "sheep and lambs fed by or for meat packers and transferred from feedlots for slaughter during the reporting year." Packer feeding of sheep and lambs includes separate feeding activities by owners, officers, and employees of meat packers, and by nonreporting subsidiaries and affiliates.¹⁶ During 1986-90, the most recent 5-year period for which statistics are available, packer feeding of sheep and lambs ranged from 28 to 30 percent of the equivalent of FI slaughter as shown in the following tabulation:¹⁷

<u>Year</u>	<u>Number fed</u> - (1,000) -	<u>Share of slaughter</u> ----- (Percent)-----
1986	1,434	27.8
1987	1,339	28.0
1988	1,452	30.1
1989	1,425	28.7
1990	1,454	28.3

Large-volume plants

Figure 2-3 shows the approximate location of the largest volume lamb-slaughtering plants operating in the United States as of July 1995 and the large-volume plants that closed since the publication of the Commission's *Final Monitoring Report* (December 1990). These large-volume plants are primarily located in the Midwest and Western States and accounted for more than 75 percent of total U.S. lamb slaughter annually during 1990-94.¹⁸

Since December 1990, no new large-volume lamb-slaughtering plants have opened in the United States.¹⁹ However, testimony at the Commission's hearing indicated that a new lamb-slaughtering plant was being planned by Aussie Meats of North America (AMONA Foods) in conjunction with certain U.S. lamb producers and would be located in Wyoming.²⁰ Testimony indicated that AMONA's Australian joint venture partner has and will continue to provide technical

assistance to this project, including providing a full time engineer to assist in the facility's construction.²¹

Four large-volume plants have closed or ceased slaughtering lambs since the Commission published its *Final Monitoring Report* in December 1990. The Kansas plant, owned and operated by Monfort, Inc., closed effective March 19, 1992. The plant in Ellensburg, Washington, owned and operated by Superior Packing Co. ceased slaughtering lambs effective February 7, 1993, but still processes lamb meat. The plant in Albert Lea, Minnesota, known as Seaboard Farms, was owned and operated by Farmstead Foods, closed in May 1990 and reopened in October 1990. The plant was multi-species, slaughtering lambs, but operated primarily as a swine slaughtering plant. The plant closed effective March 22, 1994. On March 31, 1995,²² Monfort announced the closing of its San Angelo, Texas, plant effective May 31, 1995,²³ citing the reduction of sheep and lamb numbers and the decreasing demand for lamb meat in the United States.²⁴ In June 1995, Monfort announced its Greeley, Colorado lamb plant will continue to slaughter lambs, but no longer fabricate them stating "they don't have the operations we need to compete."²⁵

Financial experience of U.S. packers

Packers accounting for over 86 percent of U.S. production of lamb meat in 1994 provided income-and-loss data to the Commission on their operations producing lamb meat.

Operations on lamb meat

Net sales values and the average per-pound sales values followed the same trend, as shown in table 2-1, decreasing from 1990 to 1991, and then increasing each year through 1994. The reporting packers realized operating income in each period with the operating income share of net sales ranging from 1.4 percent in 1993 to 3.5 percent in 1994. The operating income was 3 cents per-pound in 1990 and 1991, 2 cents in 1992 and 1993, and 6 cents in 1994.

Capital expenditures

U.S. packers provided data on their capital expenditures for lamb meat operations, as shown in table 2-2. Capital expenditures fluctuated throughout the 5-year period, reaching a low of US\$908,000 in 1991 and a high of US\$2,894,000 in 1992 expressing the lowest and highest levels over the 1990-94 period.

Packer operations

Employment and wages

U.S. lamb meat packers reported data on employment and wages during 1990-94, as shown in the following tabulation:²⁶

<u>Item</u>	<u>1990</u>	<u>1991</u>	<u>1992</u>	<u>1993</u>	<u>1994</u>
Average number of production and related workers	716	835	842	801	807
Total hours worked by such workers (1,000)	1,513	1,759	1,672	1,599	1,663
Total compensation to such workers (1,000 dollars)	14,447	16,717	16,584	16,126	17,544
Annual compensation per worker (1,000 dollars)	20	20	20	20	22
Average hourly compensation to such workers (dollars per hour)	9.55	9.50	9.92	10.09	10.55

The number of workers peaked in 1992 before falling and leveling in subsequent years. Total hours worked peaked in 1991, fell during 1992 and 1993, and rose again in 1994. Total compensation and average hourly compensation increased irregularly, while annual compensation per worker was practically constant during the period under review.

Productivity

Productivity in the U.S. lamb packing industry, as measured by the number of man-hours required to process a lamb, the annual number of lambs slaughtered per worker, and worker compensation per lamb slaughtered, is shown in the following tabulation for 1990-94:²⁷

<u>Item</u>	<u>1990</u>	<u>1991</u>	<u>1992</u>	<u>1993</u>	<u>1994</u>
Total hours worked by production and related workers (1,000)	1,513	1,759	1,672	1,599	1,663
Number of lambs slaughtered (1,000)	3,429	3,701	3,997	3,756	3,821
Hours (per lamb)44	.48	.42	.43	.44
Average number of production and related workers	716	835	842	801	807
Lambs slaughtered (per worker hour)	2.27	2.10	2.39	2.35	2.30
Total compensation to such workers (\$1,000)	14,447	16,717	16,584	16,126	17,544
Worker compensation (dollars per lamb)	4.21	4.52	4.15	4.29	4.59

²⁶ Data submitted in response to questionnaires of the USITC.

²⁷ Data submitted in response to questionnaires of the USITC.

The various measures of productivity fluctuated during the period under review and showed no discernable trend.

Costs to process lamb meat

Data collected from questionnaire responses indicate that in 1994 the cost of live lambs accounted for about 74 percent of the packers' cost to process lamb meat. Direct labor costs accounted for about 10 percent, and other factors made up the remainder.

Domestic Production, Consumption, and Prices

Live Lamb Production

Decisions made by growers largely determine the supply of domestic lamb meat in the U.S. market. Each year producers must decide if ewe (female) lambs will be sold for slaughter or retained for breeding purposes. The decision to retain ewe lambs for breeding suggests producer optimism and plans for increased production of lambs in the future. The decision to sell the lambs for slaughter suggests a declining capacity utilization. Most ewes are bred when they are 18 to 19 months of age and have their first lambs when they are about 2 years old.²⁸

It is a common practice in the United States to provide lambs on pasture with supplemental feed. The feed is typically provided in structures, called creeps, that allow entry of the lambs but prevent entry of the larger ewes. A typical ration, referred to as concentrate, for lambs in the Corn Belt consists of corn with soybean meal as a protein supplement and alfalfa hay, whereas typical concentrates for lambs in the Western States consist of grain sorghum with cottonseed meal as a protein supplement and alfalfa hay. Many U.S. lambs, at about 6 months of age and about 55 to 90 pounds in weight, (such lambs are referred to as "feeders" or "feeder lambs") are weaned and shipped to feedlots for about 2 to 3 months of intensive feeding and finishing to weights of about 130 pounds, (such lambs are referred to as fed-lambs or slaughter lambs). In feedlots, the lambs are fed to optimal size to maximize meat production and to assure an appropriate fat content for the meat. When lambs have reached appropriate slaughter weights, they are referred to as "grain-fed." Lambs that are primarily pasture-fed are referred to as "grass-fed." Some consumers contend that meat derived from grass-fed lamb is

²⁸ The quantity of lambs sold for slaughter may decline in response to an increase in lamb price in the short run if producers decide to retain lambs to build up the breeding stock. However, Whipple and Menkhaus found the price elasticity of lamb supply in the short run to be highly inelastic, but positive (0.01). Longer run elasticities, applicable for 3 to 30 years, were found by Whipple and Menkhaus to range from 0.68 to 11.38. Glen D. Whipple and Dale J. Menkhaus, "Supply Response in the U.S. Sheep Industry," *American Journal of Agricultural Economics (AJAE)*, vol. 71, No. 1, (1989), pp. 126-135.

"gamier" and has a stronger flavor and aroma than meat derived from grain-fed lambs.

The number of lambs born during the year, or the lamb crop,²⁹ declined by 23 percent between 1990 and 1994 as may be determined from table 2-3. The lamb crop depends on the number of ewes that are 1 year old or older and kept for breeding purposes and on the number of lambs born per ewe (lambing rate). The number of ewes, 1 year old or older, kept for breeding purposes declined over this period.³⁰ The decline in the January 1 inventory indicates declining capacity utilization among lamb growers and a reduction in the capital stock available for future lamb production.

Table 2-3

Sheep and lambs: U.S. ewes kept, lambing rate, and lamb crop, 1990-94

Year	Ewes kept (1,000 animals)	Lambing rate ¹ (Per 100 ewes)	U.S. lamb crop (1,000 animals)
January 1,			
1990	7,609	102	7,704
1991	7,425	103	7,644
1992	7,090	102	7,216
1993	6,536	98	6,379
1994	5,804	102	5,902

¹ Number of lambs born.

Source: USDA, ERS, *Livestock and Meat Statistics, 1970-92* (Statistical Bulletin No. 874), Jan. 1994, p. 92, and USDA, NASS, *Sheep and Goats*, Jan. 27, 1995, p. 3.

Lamb Meat Production

Total U.S. lamb meat production declined from 346 million pounds in 1990 to 300 million pounds in 1994, or by 13 percent (table 2-4). U.S. lamb meat production reflects both the number of lambs slaughtered and the average

²⁹ In some States, especially the Western States, the lamb crop is estimated when the young lambs (about two weeks of age) are "worked", i.e. when the lambs have their tails removed (docked) and when the ram lambs are castrated. Adverse weather can kill many lambs before they are "worked," thus they are not included in the lamb crop.

³⁰ Adverse weather, either during the breeding season or during the lambs' birth, contributes to reduced lambing rates. If a large share of the January 1 inventory consists of ewes kept for breeding purposes that are more than 1 year but less than 2 years old and not bred, the lambing rate during the year will be lower than if the January 1 inventory consists of a larger share of bred ewes.

Table 2-4

Lamb: U.S. commercial lamb slaughter, average carcass weight, and total lamb meat production, 1990-94

Year	Commercial slaughter (1,000 animals)	Average carcass weight (Pounds)	Lamb meat production (1,000 pounds)
1990	5,312	64	346,244
1991	5,377	64	346,454
1992	5,176	64	335,337
1993	4,885	65	326,682
1994	4,635	63	299,929

Note: Lamb meat production includes farm production.

Source: U.S. lamb slaughter and average carcass weight compiled from official statistics of USDA, ERS, *Livestock and Meat Statistics, 1970-92*, and *Livestock Slaughter*, annual issues; U.S. lamb meat production estimated by the U.S. International Trade Commission.

carcass weight. Monthly production data are shown in table 2-5 and reflect the seasonality of lamb production.³¹

Domestic Consumption

During 1990-94, U.S. lamb meat consumption,³² declined from 370 million pounds to 339 million pounds (figure 2-4). Tables 2-6 and 2-7 show U.S. annual and monthly consumption of lamb meat. Monthly consumption is generally higher during holiday periods, such as Easter. The decline in the annual amount of lamb meat consumed in the United States during 1990-94 reflects a decline in U.S. production, inasmuch as inventories were small and imports rose during the period.

Lamb Meat as a Share of Total Meat Consumption

Table 2-8 shows that consumption of lamb meat declined irregularly during 1990-94, whereas apparent consumption of beef, pork, and poultry all increased. The sharpest change was in poultry consumption, which increased from 22 billion pounds in 1990 to 29 billion pounds in 1994, or by 32 percent.

³¹ The lamb carcass is divided into primal cuts. USDA reports that the shares of carcass weight accounted for by these cuts are as follows: hind legs (31 percent), shoulder (27 percent), loin (18 percent), breast (16 percent), and rack (8 percent).

³² Estimated by the staff of the U.S. International Trade Commission from domestic lamb meat production, plus imports, and adjusted for changes in inventories.

Source: Compiled from official statistics of the U.S. Department of Agriculture.

Figure 2-4
Lamb meat: U.S. production, Imports, and apparent consumption, 1990-94

Million pounds, carcass weight equivalent

Source: Production estimated by the staff of the USITC, based on statistics compiled from data reported by USDA (see table 2-5), imports compiled from official statistics of U.S. Department of Commerce (converted to carcass-weight equivalent on the basis of factors used by USDA); consumption is derived by combining production and imports in as much as exports are negligible.

Table 2-6

Lamb meat, fresh, chilled, or frozen: U.S. production, imports for consumption, and apparent U.S. consumption, 1990-94

Year	Carcass-weight equivalent			Ratio of imports to consumption (Percent)
	U.S. production	U.S. imports	Apparent U.S. consumption	
	----- (Million pounds) -----			
1990	346	25	370	6.8
1991	346	26	375	6.9
1992	335	27	361	7.5
1993	327	41	365	11.2
1994	300	39	339	11.5

Source: Production and consumption estimated by the staff of the U.S. International Trade Commission; imports compiled from official statistics of U.S. Department of Commerce (converted to carcass-weight equivalent on the basis of factors used by USDA).

Lamb meat's share of U.S. red meat (beef, pork, veal, lamb and mutton) consumption declined very slightly during 1990-94 from 0.9 percent of red meat total to 0.8 percent. U.S. per capita lamb and mutton consumption declined from 1.6 pounds carcass-weight equivalent (1.4 pounds retail weight) in 1990 to 1.5 pounds (1.3 pounds retail weight) in 1994.³³ The decline in lamb meat consumption during 1990-94 reflects a long-term pattern.

An economic study suggest that lamb meat competes with beef, pork, and poultry in the U.S. market.³⁴ It was also reported that U.S. lamb meat consumption has been adversely affected by a long-term growing preference for beef over lamb, by the extraordinary development of the poultry industry, and by the lack of branded, specialty markets and outlets for lamb meat in the fast-food market.³⁵

Costs and Returns for Sheep Operations

The USDA has published data on the cash and economic costs and on the returns associated with U.S. sheep production. These data, shown in table 2-9, are estimated based on a survey sent to a sample of producers in the past and are presented in terms of dollars per ewe. The focus of the following

discussion is on trends in and the relationships among elements of the data rather than on the absolute values, owing to their estimated nature.³⁶

The gross value of production includes the value of lambs raised, wool sold, and income produced from the Federal wool incentive program, payment for unshorn lamb, and payment for cull animals. Slaughter lambs accounted for about 29 percent of cash returns, and feeder lambs for about 26 percent annually. The share of cash returns accounted for by wool, generally declined from 20 percent in 1989 to 11 percent in 1994, whereas the share from payments made under the National Wool Act of 1954 (the wool incentive and unshorn lamb payment) increased from 11 percent in 1989 to 22 percent in 1994.

³⁶ Table 2-9, which provides data regarding the costs and returns associated with U.S. sheep production, is taken from the USDA publication *Economic Indicators of the Farm Sector, Costs of Production--Livestock and Dairy, 1990*. Data for 1989 and 1990 are reported in this publication. Data for 1991-94 are calculated by the USITC staff based either on methodology employed by the USDA, as described either in the publication or by USDA officials contacted by telephone, or on estimates using appropriate indices to update individual data items. In general, the data are based on USDA Farm Costs and Returns Surveys administered under the authority of the Agriculture and Consumer Protection Act of 1973. Because surveys are not sent annually, many data items are estimated by applying indices or formulae to individual data elements reported in survey responses in prior years. The USDA did not publish data on costs and returns in the sheep industry after 1990.

Source: Data for 1989-90 from USDA, ERS, *Economic Indicators of the Farm Sector, Costs of Production—Livestock and Dairy, 1990*. Data for 1991-94 are calculated by USITC staff based either on methodology employed by the USDA, as described either in the aforementioned publication or by USDA officials contacted by telephone, or on estimates using appropriate indices to update individual data items. In general, the data are based on USDA Farm Costs and Returns Surveys administered under the authority of the Agriculture and Consumer Protection Act of 1973. Surveys are not sent annually, however, and many data items are estimated by applying indices or formulae to individual data elements reported in survey responses in previous years. The USDA did not publish data on costs and returns in the sheep industry after 1990.

The costs of production include expenses assumed to be cash costs. Feed (grains, protein supplements, hay, pasture, etc.) accounted for about 45 percent of total variable cash expenses annually during 1989-94. Grains and protein supplements accounted for about 20 percent, and hay accounted for an additional 10 percent of variable cash expenses. Of other total variable cash expenses (labor, buildings, hauling, etc.), labor accounted for about 23 percent and buildings for 8 percent.

The value of production less cash costs and capital replacement costs during 1989-94 is shown in the following tabulation (U.S. dollars per ewe):

<u>Year</u>	<u>Unit value</u>
1989 . .	14.16
1990 . .	9.25
1991 ¹ . .	5.33
1992 ¹ . .	11.98
1993 ¹ . .	16.01
1994 ¹ . .	15.57

¹ Estimated by USITC staff.

The estimated decline in cash receipts by lamb producers during 1990-91 primarily reflects lower returns for live animals. Cash receipts for live animals rose significantly during 1992-93, and this rise contributed mainly to the increased total cash receipts. Cash receipts for live animals were stable in 1994; however, cash receipts from wool sales increased.

The cost of raising a lamb to slaughter weight under range (grass-fed) management has been shown in one study to be more than that of raising a lamb under feedlot (grain-fed) management in the United States, given the prices³⁷ used in the study.³⁸ However, profits were greater under range management than they were under feedlot management.³⁹

Notwithstanding that range management is more profitable, only about 20 percent of the lambs in the United States can be grown to slaughter weight under range management. Also, it should be noted that feed costs were the largest cost under range management. The feed costs include concentrate and protein supplement costs for the maintenance of the ewes through the weaning of lambs. The largest components of the feed costs were grains, dehydrated

³⁷ However, it should be noted that the cost of feed and the cost of feeder lambs typically fluctuate significantly.

³⁸ The data were taken from articles in the *National Lamb & Wool Grower*, published monthly by the ASI. USITC staff reviewed the original articles, published in the December 1993 and February 1994 issues, respectively, and conducted a telephone interview with the author, Steve Meyers, on April 28, 1995.

³⁹ Under feed lot management, lambs may be shorn before they are marketed and thus become ineligible for the unshorn lamb payment.

alfalfa pellets, and alfalfa hay.⁴⁰ The feed costs also included a grazing component.⁴¹

Domestic prices

Prices for livestock and meat (including live lambs and lamb meat) tend to be volatile partly because supply responses are lagged on account of biological constraints. For example, the gestation period for sheep is about 148 days and can be modified on very slightly by grower actions.⁴² Also, the growth rate for live lambs, while more subject to grower manipulation than the gestation period, is still limited by factors such as the amount of feed that lambs can physically consume. During 1990-94, the annual average price for live slaughter lambs⁴³ rose irregularly from US\$55.42 per 100 pounds (cwt) to US\$66.77 in 1994 as shown in table 2-10. The rise in price corresponded with a general decline in lamb meat production, which fell from 346 million pounds in 1990 and 1991 to 300 million pounds in 1994. The trends in price for lamb carcasses⁴⁴ were similar to those for live lambs. During 1990-94, the annual average price for lamb carcasses rose from US\$121.47 per cwt to US\$147.62 in 1994 as shown in table 2-11.

Prices for both live lambs and lamb carcasses are often higher in the spring than before or after spring, apparently reflecting the traditional demand for lamb meat for holiday meals. The prices for both live lambs and lamb carcasses generally rose during 1990-94, notwithstanding an irregular rise in the quantity of U.S. imports of lamb meat from 25 million pounds (carcass-weight equivalent) in 1990 to 39 million pounds in 1994.

U.S. Grading System

The official USDA quality grades of lamb (both live lambs and lamb carcasses) are Prime, Choice, Good, and Utility. Most purchasers prefer cuts from carcasses that are Choice, and most of the lamb carcasses are so graded. Expense associated with feeding lambs for the Prime grade is generally not recoverable in the marketplace. Lambs are also graded by yield, determined by the amount of external fat, the amount of kidney and pelvic fat, and the confirmation grade of the leg. The yield grades are 1 through 5, with 1 representing the leanest carcasses and 5 the fattest.

USDA grading is voluntary and entirely different from health and sanitary regulations, which are mandatory and described in the "U.S. Trade and Regulatory Measures" section of this report. During the 1994 fiscal year, processors requested the voluntary grading of 88 percent of the Federally Inspected (FI) lamb slaughter; of this, 90 percent yielded a quality grade of

Choice or Prime.⁴⁵ In addition to the voluntary USDA grading system, some packers have their own private grades often used in conjunction with USDA grades.⁴⁶

Channels of Distribution

Grower Sales of Live Lambs⁴⁷

The U.S. market for slaughter lambs generally consists of many sellers (growers) and few buyers (packer/processors), usually operating independently. Live lamb price statistics are reported to the public by the ASI, the USDA, and by local news-reporting organizations.

Live lambs in the United States, whether feeders or slaughter lambs, may be sold at auction markets, terminal markets, or nonpublic markets. Nonpublic markets include direct sales to packers negotiated by growers, by order buyers, or by other middlemen. In recent years, slightly more than 80 percent of lambs sold for slaughter have been sold through nonpublic markets. Also, in recent years, some lambs have been sold through electronic marketing systems.

A number of methods are used to determine a price for feeder or slaughter lambs. Most lambs are purchased on a live weight basis with the grower being paid a market price per pound based on the weight of the animal when sold. There are, however, several variations of the live weight purchase method currently in practice.⁴⁸ As with other species of livestock, some lambs are purchased on the basis of the carcass they yield.

Growers have for many years expressed concern about packer feeding of lambs in that packers can time the slaughtering of the lambs they feed to exert maximum price influence. Thus, when market prices for live lambs rise, packers who feed lambs can temporarily withdraw from the market but continue to operate their slaughter plants using lambs they have fed. Growers, with no viable alternative, are subsequently forced to sell their animals to the packers at reduced prices.

Domestic Lamb Meat

Almost all firms that slaughter lambs process at least some of their carcasses into primal and subprimal cuts, and some firms produce retail cuts as well. About 65 percent of lamb received by retailers is in carcass form.⁴⁹ Some carcasses move to a type of wholesaler called a breaker. Breakers divide

⁴⁵ Evan Stachowicz, USDA, Agricultural Marketing Service, telephone conversation with USITC staff, Jan. 24, 1995.

⁴⁶ *Scientific Farm Animal Production*, p. 140.

⁴⁷ The following description of the channels of distribution was adapted from the *Sheep Production Handbook*, 1988, ch. MKT.

⁴⁸ For a more detailed discussion of pricing methods, see USITC, *Final Monitoring Report*, publication 2435, Dec. 1990.

⁴⁹ *Sheep Production Handbook*, 1988, ch. MKT.

carcasses into primal, subprimal, or retail cuts for resale to nonbreaker wholesalers or retail outlets. Some lamb meat is processed into portion controlled cuts for food service outlets.

An increasing share of lamb, including lamb carcasses, has apparently been sold as boxed lamb. Boxed lamb is lamb meat that has been divided into primal or subprimal cuts and sealed in air-tight plastic material. This packaging increases the shelf life of the lamb and its shipping reduces freight cost because less fat and bone are shipped. Further, retailers and food service buyers can order specific cuts, thereby eliminating their need to sell or discard slower moving cuts, further reducing waste.⁵⁰

Lamb meat consumption in the United States is concentrated on the East and West coasts. According to ASI, the Northeast and mid-Atlantic States account for more than 50 percent of lamb meat consumption in the United States with New York alone accounting for 30 percent. California is estimated to account for 17 percent of U.S. consumption. Chicago, Illinois and Miami, Florida are also reported to be good markets for lamb.⁵¹

Imported Lamb Meat

The channels of distribution for Australian lamb meat vary in part with the type of lamb under consideration.⁵² Fresh Australian lamb is shipped by air to the United States under the "Fresh Australian Range Lamb" (FARL) program.⁵³ Fresh Australian lamb is sold to both the retail and food service sectors. An importer and marketer of FARL testified that his company sells this product to over 1,000 supermarkets and to large-volume food service suppliers.⁵⁴ He also stated that 85 percent of his company's sales were to the retail supermarket industry.⁵⁵

In the retail sector, the transaction among exporter, importer, and retailer is direct, although importers often choose to use brokers to develop business and deal with customer requirements on a day-to-day basis. At the food service level, fresh lamb is sold through a distributor that services regional units of rather expensive restaurant chains or individual "white table cloth" restaurants.⁵⁶ A U.S. meat distributor reported that his company purchased most of his imported lamb meat from FoodComm International (FoodComm) and supplied U.S., Australian, and New Zealand lamb meat to top white table cloth restaurants.⁵⁷ The distributor also reported that some

restaurants that normally couldn't afford a large domestic lamb rack could offer the smaller and less costly imported rack or lamb sirloins.⁵⁸

The president of FoodComm reported that he believed FoodComm was the largest importer of sheepmeat products and that the company procured such products from Australia and New Zealand to supply both food service and retail accounts.⁵⁹ He also indicated that most of FoodComm's US\$30 million in sales were of sheepmeat. He reported that the majority of food service companies, wholesale jobbers, and retail operators handle a combination of domestic and imported Australian and New Zealand lamb. He supported the AMLC contention that, in the last 2 years, frozen lamb carcass imports have increased because the ethnic retail trade substituted frozen lamb for frozen mutton that was in limited supply because of the U.S. Meat Import Act.⁶⁰

Reportedly 75 percent of New Zealand lamb sales in the United States are to the food service sector.⁶¹ The New Zealand Meat Producers Board (NZMPB) reported that it expended much effort in developing the food service market apparently as the result of problems associated with the retail market. The NZMPB reported that at retail the frozen New Zealand lamb meat most often appears in the frozen food section not in the fresh meat case where consumers make meat purchasing decisions. The NZMPB also reported that store personnel pay less attention to the maintenance of the frozen meat section and consequently it is frequently understocked or contains packages in poor condition. Chilled New Zealand lamb is sold to particular market segments, such as specialty retail outlets and white table cloth restaurants. Exporting of lamb from New Zealand is carried out by private companies.⁶² Commercial operators reportedly emphasize two marketing aspects: contractual relationships and relative returns received from different customers.⁶³

Lamb Meat Importer Questionnaire Responses

Most U.S. importers of lamb meat who responded to USITC questionnaires reported that they made sales of fresh, chilled, or frozen lamb meat on a daily basis and that their sales pattern did not change significantly during 1990-94. For fresh or chilled lamb meat, the average lead time between placing an order and receiving product ranged from 1 to 2 weeks from New Zealand and 1 to 6 weeks from Australia; for frozen lamb meat, 1 to 2 months from New Zealand and 1 to 4 months from Australia. For fresh or chilled lamb meat, the minimum quantity required for purchases of imported lamb meat ranged from 300 to 3,000 pounds from Australia and from 2,000 to 3,500 pounds from New Zealand, and, for frozen lamb meat, 20,000 to 32,000 pounds from Australia

⁵⁸ Ibid., p. 115.

and 20,000 to 25,000 pounds from New Zealand. Sales terms (prices, payments, contracts) between importers and their customers are generally negotiated.

Lamb Meat Purchaser Questionnaire Responses

Most U.S. purchasers of lamb meat who responded to questionnaires reported making purchases of fresh or chilled lamb meat on a daily and weekly basis and of frozen lamb meat on a weekly and monthly basis. This sales pattern did not change significantly during 1990-94. The purchasers reported that they changed suppliers infrequently and that they generally contacted one to three suppliers for fresh or chilled lamb meat and two to four for frozen lamb meat. For fresh or chilled lamb meat, the average lead time between placing an order and receiving the product ranged from 3 to 7 days from the United States, 14 days from Australia, and 14 to 21 days from New Zealand; and, for frozen lamb meat, 7 days from the United States, 7 to 21 days from Australia, and 10 to 21 days from New Zealand. The minimum quantity required for purchases of fresh or chilled lamb meat from the United States was from none to 1,000 pounds; no minimum purchase requirement was reported for frozen lamb meat from the United States. The minimum purchase reported for imported fresh or chilled lamb meat from Australia was from none to 3,300 pounds and from none to 40,000 pounds for frozen lamb meat. No minimum purchase requirements were reported for imports from New Zealand.

U.S. Trade and Regulatory Measures

U.S. imports of fresh, chilled, or frozen lamb meat are subject to import duties (tariffs) as provided for under the *U.S. Harmonized Tariff Schedule* (HTS). All imports are subject to health and sanitary regulations administered by the USDA. In addition, imports from New Zealand were subject to countervailing duties.

U.S. Tariff Treatment

Since January 1, 1989, fresh, chilled, or frozen lamb meat has been provided for in chapter 2 of the *HTS*. Appendix E contains a copy of pertinent portions of the *HTS*, including the rates of duty. For a discussion of relevant legal notes, an explanation of the rates of duty, and for other elements of the *HTS*, see appendix E.

Under the *HTS*, the subject imports (HTS subheadings 0204.10.00, 0204.22.20, 0204.23.20, 0204.30.00, 0204.42.20, and 0204.43.20) are dutiable at 1 cent/kilogram. The ad valorem equivalent of the 1994 rate of duty for imports of fresh, chilled, or frozen lamb meat from Australia and New Zealand was 0.3 percent and averaged 0.3 percent for all suppliers. The rates of duty are subject to staged reductions, to 0.7 cents per kilogram, as a result of the Uruguay Round negotiations.

Health and Sanitary Regulations

Rinderpest and Foot-and-Mouth Disease

U.S. imports of certain live animals, including sheep and lambs and certain fresh, chilled, or frozen meats, including lamb, are generally limited to countries that have been declared free from rinderpest and foot-and-mouth diseases⁶⁴ by the U.S. Secretary of Agriculture.⁶⁵ Australia and New Zealand have been declared free from the diseases.⁶⁶

The Federal Meat Inspection Act

The USDA administers section 20 of the Federal Meat Inspection Act (21 U.S.C. 620), which provides, in subsection (a), that meat and meat products prepared or produced in foreign countries may not be imported into the United States ". . . unless they comply with all the inspection, building construction standards, and all other provisions of this chapter [ch. 12, Meat Inspection] and regulations issued thereunder applicable to such articles in commerce in the United States."⁶⁷

One of the results of the USDA inspection program was that, during 1993, 309,000 pounds of fresh, chilled, or frozen mutton and lamb meat (266,000 pounds from Australia and 43,000 pounds from New Zealand) were refused entry for various reasons.⁶⁸ These amounts constituted less than 1.4 percent of the fresh, chilled, or frozen mutton and lamb meat offered for entry to the United States.

Import Investigations

During the 1980s, the domestic lamb industry filed three petitions with the USITC and the Department of Commerce (DOC) alleging that imports of lamb meat from New Zealand were being subsidized and/or were being sold in the United States at less than fair value (LTFV). A fourth petition alleging that imports of lamb meat were being subsidized by the Government of New Zealand was filed with the DOC in 1985.

A countervailing duty (CVD) petition filed by the National Wool Growers Association, Inc., and by the National Lamb Feeders Association, Inc., before

⁶⁴ Rinderpest and foot-and-mouth diseases are highly contagious, infectious diseases that can afflict cloven-footed animals (such as cattle, sheep, swine, and deer). Because the diseases are easily transmitted and are debilitating, they are an ever-present threat to the U.S. livestock industry. The diseases do not present a direct threat to human health.

⁶⁵ Sec. 306 of the Tariff Act of 1930 (19 U.S.C. 1306).

⁶⁶ For a more detailed discussion of this issue, see USITC *Final Monitoring Report*, publication 2345, Dec. 1990.

⁶⁷ For a more detailed discussion of health and sanitary regulations, see USITC *Final Monitoring Report*, publication 2345, Dec. 1990.

⁶⁸ USDA, *Meat and Poultry Inspection, 1993*, Report of the Secretary of Agriculture to the U.S. Congress, Sept. 1994, p. 61.

Commerce on April 23, 1981, and before the Commission on September 21, 1981,⁶⁹ alleged that imports of lamb meat were being subsidized.⁷⁰ The Commission made an affirmative determination on November 8, 1981.⁷¹ On November 30, 1981, Commerce announced its preliminary affirmative countervailing duty determination, estimating a net subsidy of 6.19 percent of the f.o.b. value of lamb meat exports to the United States.⁷² However, shortly thereafter the petitioners requested that the petition be withdrawn.⁷³

On April 18, 1984, CVD and antidumping petitions were filed with the Commission⁷⁴ and Commerce by the American Lamb Co., the Denver Lamb Co., and the Iowa Lamb Corp. on behalf of sheep ranchers, lamb feedlot operators, and lamb meat packing and processing companies. The petitions alleged that imports of lamb meat from New Zealand were being subsidized and were being sold in the United States at LTFV. On June 4, 1984, the Commission found no reasonable indication of injury to the domestic industry as a whole.⁷⁵

On March 26, 1985, Commerce received a petition alleging that producers, processors, or exporters of lamb meat in New Zealand receive benefits that constitute⁷⁶ bounties or grants within the meaning of section 303 of the Tariff Act of 1930; Commerce initiated its investigation on April 15, 1985.⁷⁷ On September 17, 1985, Commerce published a final determination that certain benefits, determined to be about US\$0.18/lb, were provided to producers, processors, or exporters of lamb meat in New Zealand.⁷⁸

Eight final administrative reviews of the CVD order on lamb meat from New Zealand were completed by Commerce. Remedies decreased from NZ\$0.31/lb

⁶⁹ USITC, *Lamb Meat From New Zealand*, investigation No. 701-TA-80 (preliminary), USITC publication 1191, 1981.

⁷⁰ On September 17, 1981, the USTR announced that New Zealand had become "a country under the Agreement." Hence, the USITC instituted a preliminary CVD investigation on September 21, 1981.

⁷¹ See USITC publication 1191 and 46 F.R. 222, Nov. 18, 1981.

⁷² 46 F.R. 229, Nov. 30, 1981.

⁷³ On December 23, 1981, the USITC was notified by the petitioners by letter that they desired to withdraw the petition. On January 4, 1982, the USITC terminated the final investigation.

⁷⁴ USITC, *Lamb Meat From New Zealand*, investigation Nos. 701-TA-214 (preliminary) and 731-TA-188 (preliminary), USITC publication 1534, June 1984.

⁷⁵ *Ibid.*

⁷⁶ The petitioners on behalf of the U.S. lamb meat industry were the American Lamb Co., the Denver Lamb Co., and the Iowa Lamb Corp.

⁷⁷ No injury determination by the Commission was required in this investigation because it was conducted under section 303 of the Tariff Act of 1930. Under this section of U.S. law, imports were not entitled to an injury test in a CVD investigation unless the imports are from countries that are signatories to the GATT Subsidies Code (or they have assumed substantially equivalent obligations to those under the code), except in cases where the imports enter duty free. In this case, New Zealand was not a "country under the Agreement" within the meaning of section 701(b) of the Tariff Act as it then existed, and the merchandise subject to investigation was dutiable.

⁷⁸ "Final Affirmative Countervailing Duty Determination and Countervailing Duty Order; Lamb Meat From New Zealand," 50 F.R. 37708, Sept. 17, 1985.

for shipments during the first review period (June 25, 1985-March 31, 1986) to NZ\$0.21/lb for April 1, 1986-March 31, 1987. Remedies (which shifted from a specific rate to an ad valorem rate) decreased for each annual review.⁷⁹ The total bounty or grant was found to be *de minimis* for all firms for the review period April 1, 1990, through March 31, 1991. A subsequent final review for the period April 1, 1991, through March 31, 1992 also determined *de minimis* CVD amounts for all firms. On May 22, 1995, the DOC published a notice of its final determination that the subsidy for the period April 1, 1992 through March 31, 1993 was *de minimis* for all firms. In the same notice, the DOC reported its final determination that New Zealand had met the requirements for revocation of the CVD order and reported that the CVD order would be revoked.⁸⁰

Pursuant to section 1937⁸¹ of the Omnibus Trade and Competitiveness Act of 1988, the USITC conducted a 2-year monitoring and investigation⁸² of U.S. lamb meat imports during 1988-89 under section 332(g) of the Tariff Act of 1930 (19 U.S.C. 1332(g)). Lamb meat is also one of the eight case studies included in Commission investigation No. 332-344 on the economic effects of antidumping and countervailing duty orders and suspension agreements.⁸³

Industry Concerns

In recent years, U.S. sheep and lamb growers have expressed concern about a number of issues. The issues cited include: termination of the National Wool Act of 1954, lamb and sheep losses to predators, restrictions on the use of Compound 1080 (a chemical toxicant), general decline in the infrastructure of the U.S. sheep industry, grazing issues, and a shortage of qualified shepherds in the United States.

National Wool Act

The National Wool Act of 1954 (Wool Act), as amended, provides for wool incentive payments to growers. However, the Omnibus Budget Reconciliation Act of 1993, Public Law 103-130,⁸⁴ provided for a phaseout of the incentive

⁷⁹ The bounty increased for one firm during review period April 1, 1988, through March 31, 1989.

⁸⁰ See 60 F.R. 27082, May 22, 1995, Notice of Final Results of Countervailing Duty Administrative Review and Revocation of Countervailing Duty Order.

⁸¹ Section 1937 was a conference agreement resolving U.S. House of Representative and U.S. Senate differences concerning lamb meat imports. A Senate amendment authorized import quotas for lamb meat, but the House bill had no such provision.

⁸² USITC, *Final Monitoring Report*, investigation No. 332-264, publication 2345, Dec. 1990.

⁸³ USITC, *The Economic Effects of Antidumping and Countervailing Duty Orders and Suspension Agreements*, investigation No. 332-344, publication 2900, June 1995.

⁸⁴ Enacted on November 1, 1993.

payments over the marketing years 1993/94 and repealed the Wool Act effective December 31, 1995. For the marketing year 1994 (payments made April 1995), producers are to receive only 75 percent of their calculated payment, and, for the marketing year 1995 (payments made April 1996) they are to receive only 50 percent.

The USITC estimated the share of growers' income accounted for by incentive payments under the Wool Act.⁸⁵ Growers receive income from both marketing shorn wool and from Federal incentive payments. Gross income from sheep and lambs received by growers,⁸⁶ the value of shorn wool grown,⁸⁷ wool incentive payments,⁸⁸ total income, and the shares of total income from wool and from incentive payments as reported by USDA or derived from USDA data are shown in the following tabulation:

<u>Year</u>	<u>Gross income from sheep and lambs¹</u>	<u>Value of shorn wool grown</u>	<u>U.S. Federal Government payments</u>	<u>Total</u>	<u>Share of gross income from--</u>

Predators

Predation by wildlife has always been a problem for U.S. sheepgrowers.⁸⁹ Domestic interests contend that livestock losses to predators have increased in recent years and have cited a number of reasons including: more predators; fewer and less efficient methods of controlling predators; increased

⁸⁵ The USITC estimates were made in consultation with officials of the ASI in a telephone conversation on April 20, 1995.

⁸⁶ As reported in the USDA's annual publication *Meat Animals Production, Disposition and Income*.

government resistance against the management not only of predators but of all wildlife; and increased use of USDA's limited resources.⁹⁰

A total of 368,050 sheep and lambs, valued at US\$17.7 million, were lost to predators during 1994.⁹¹ Losses to predators accounted for 39 percent of total losses from all causes in that year. Coyotes accounted for 66 percent of the losses, or 243,800 animals valued at US\$11.5 million. Nearly all states reported losses to coyotes, but most losses (92 percent) to coyotes were in the Western States and Mountain States. Dogs accounted for 11 percent of the losses, or 40,325 animals valued at US\$2.2 million. Other predators include mountain lions, bears, foxes, eagles, and bobcats.

In a 1994 survey conducted by the Wyoming Wool Growers Association,⁹² over 80 percent of Wyoming sheep producers listed predators as their most serious problem. Many sheep growers and other agricultural interests express strong opposition to the release of wolves.

Animal Damage Control⁹³

The U.S. Government's primary involvement with sheep predators is through the USDA, Animal and Plant Health Inspection Service (APHIS), Animal Damage Control (ADC) Program. The primary statutory authority for the ADC program is the Animal Damage Control Act of March 2, 1931, as amended (7 U.S.C. 426-426c). The mission of the ADC program is "to provide leadership in wildlife damage control to protect America's agricultural, industrial, and natural resources and to safeguard public health and safety."⁹⁴ This mission is accomplished through cooperative wildlife damage management programs; collection, evaluation, and dissemination of information; training of wildlife managers; and the provision of data and sources for limited-use pesticides. The ADC operates research facilities and manufactures and sells specialized wildlife damage control materials not readily available from commercial sources. ADC is also responsible for nonagricultural matters, for example control of wildlife hazards to aircraft. A number of ADC programs are conducted in this area. ADC was transferred from the U.S. Department of Interior, Fish and Wildlife Service to the USDA, APHIS, in 1986.

ADC program services are provided after specific requests and are delivered through a collection of cooperative programs with other Federal,

⁹² Bryce Reece, executive director, Wyoming Wool Growers Association, interview by USITC staff, Oct. 12, 1994.

⁹³ The following description of the ADC was taken largely from USDA, APHIS, *Animal Damage Control Program Final Environmental Impact Statement*, vol. 2, Apr. 1994.

⁹⁴ *Animal Damage Control Program Final Environmental Impact Statement*, vol. 2, Apr. 1994, p. 7.

State, and local agencies and private entities. Services vary widely from state to state. ADC efforts are largely directed toward cost-shared activities. ADC program service is delivered to the public by two basic means: technical assistance and direct control. Direct control is typically provided when funding is available and technical assistance alone is inadequate. In April 1994, the ADC published the *Animal Damage Control Program Final Environmental Impact Statement* that, among other things, established the guidelines that are to direct the basic activities of the ADC program.

The ADC program employs or recommends a number of techniques to control predators. Wildlife capturing or killing techniques recommended or used for direct control by the ADC program include: leghold traps; cage traps; snares; quick-kill traps; denning; shooting; and the use of chemical toxicants. ADC program technical advice to livestock producers may include advice on management practices, such as the management of guard animals or suggestions for raising alternative livestock species. The ADC program may recommend habitat management, such as elimination of wildlife feeding stations, or may provide technical advice on the physical exclusion of predators, such as fencing.

The ADC is negotiating Memoranda of Understanding with the USDA Forest Service (FS) and the Bureau of Land Management (BLM) whereby the ADC will be the lead agency for predator control on lands administered by the FS and BLM.⁹⁵ The budget for the ADC program for 1993, the most recent year for which data are available, was US\$36.3 million. Expenditures for livestock were reported to be US\$20 million.⁹⁶ Data on the share of the ADC budget directly applicable to the sheep and lamb sector are not available.

Compound 1080

Many growers contend that government restrictions effectively prohibit the use of a popular chemical toxicant, Compound 1080, to control predators. Compound 1080 (sodium fluoroacetate), referred to in the industry as "ten-eighty," was used by the ADC program in baiting to control livestock predators before 1972. Compound 1080 was previously used as a rodenticide, but, because it had significant nontarget effects from primary and secondary toxicity, authority for the use was cancelled by the EPA.

Executive Order 11643, February 8, 1972,⁹⁷ banned the use of toxicants for predator control by Federal agencies or for use on Federal lands. Subsequent to Executive Order 11643, the EPA cancelled the registration of Compound 1080, as well as a number of other chemicals.⁹⁸ In 1986, the EPA

again registered Compound 1080, although it must also be approved for use by State officials in any State where it is to be used.⁹⁹

As of July 1995, Compound 1080 is used for coyote control only in the livestock protection collar (LPC). The LPC, attached to the neck of a sheep or goat, dispenses the toxicant when the LPC is punctured by an attacking coyote. The LPC was designed specifically for coyotes, which attack the throat of a sheep or goat; however, domestic dogs and bobcats have attacked collared sheep and goats and succumbed to the toxicant. LPCs were used by the APHIS, ADC program in Texas between FY 1988 and FY 1991 and have been used independently by growers.

Infrastructure

Many domestic interests, citing declining market outlets and shortages of specialized labor, have expressed concern about a general decline in the infrastructure available to live lamb and sheep growers.¹⁰⁰ For example, a relatively few large-volume slaughter plants tend to be located in different regions of the country, limiting growers' opportunity to market their lambs. In addition, as the number of producers and sheep flock declined, producers report a corresponding decline in infrastructure, such as, the number of shepherds and shearers, specialized trucks used to haul lambs to feed lots, and veterinarians that specialize in the care of sheep.

Some domestic interests contend that the relative small size of the U.S. live lamb and sheep sector in relation to that of the U.S. cattle or swine sectors puts U.S. growers at a disadvantage. They argue that companies that produce livestock machinery and equipment are less inclined to target research or investments toward the live lamb and sheep sector because the potential market is relatively small. They frequently cite the large investment in time and money required of pharmaceutical companies as a deterrent to research and development of medicines for the sheep sector. Some observers note the small size of the U.S. lamb industry as a comparative disadvantage to the lamb industry in Australia and New Zealand.

Grazing Sheep and Lambs on Federal Lands

The USDA, FS and the U.S. Department of Interior, BLM, administer programs that allow livestock grazing on approximately 307 out of 329 million acres of public rangelands.¹⁰¹ Only 10 percent of total forage consumption by

⁹⁹ Bobby Acord, deputy director, APHIS, ADC, telephone conversation with USITC staff, Mar. 6, 1995.

¹⁰⁰ Sheep and lamb growers, Cheyenne, Wyoming, interview by USITC staff, Oct. 1994.

¹⁰¹ Public Land Council, *The Western Rancher, A Tradition of Economic and Environmental Success*, 1991.

domestic livestock is provided by public rangelands.¹⁰² An estimated 25 percent of the U.S. sheep population spends a portion of the year on Federal lands, and depends on it for forage.¹⁰³ Sheep are reported to be more efficient than cattle for using winter grazing on public lands because they can generally thrive on available vegetation, whereas cattle must be supplied with supplemental hay.¹⁰⁴ The requirement for supplemental hay equates to US\$200 per cow/calf unit, assuming the cost of hay at US\$75 per ton.¹⁰⁵

Forest plans provide management direction and resource objectives for National Forest System rangelands. Since forest plans are generally long and complex documents, livestock grazing permittees often find it difficult to understand how the forest plan applies to their grazing permits and livestock grazing practices. It is also difficult for the Forest Service to achieve forest plan objectives if forest plan direction is not clearly tied to the grazing permit. To eliminate uncertainty and to ensure that forest plan direction is clearly linked to terms and conditions of a grazing permit, the Forest Service is considering amending the grazing regulations to specifically require that forest plan management direction and resource objectives applicable to livestock grazing be added to the terms and conditions of the livestock grazing permit.

In order for ranchers to use public lands for grazing livestock, they are required to obtain a permit from the FS, BLM, or both. Since western FS- and BLM-controlled and privately-owned lands are often intermingled or adjacent, many livestock operators hold permits from both agencies. Under terms of the Granger-Thye Act of 1950, permits are issued to livestock operators for a period not to exceed 10 years.¹⁰⁶ The Federal Land Policy and Management Act of 1976 authorizes the FS and BLM to issue permits, in the interest of sound land management practices, with a term shorter than 10 years. However, neither agency has fully exercised the option of issuing grazing permits shorter than a 10-year maturity. The FS is reviewing a proposed rule that would base tenure permits on a permittee's record of compliance.¹⁰⁷ A permit renewal would be issued for a full 10-year period if the permittee has been in compliance with the terms and conditions of the previous grazing permit. If a permittee has been found to be in poor compliance, the permit may not be reissued.

¹⁰⁶ Granger-Thye Act of 1950 (16 U.S.C. 5801).

¹⁰⁷ *Range Management; Grazing and Livestock Use and Grazing Fees*, 58 F.R. 43202.

Grazing fees have always been a contentious issue.¹⁰⁸ On one hand, livestock producers argue that the fees reflect fair market value because public lands are significantly less productive than private rangelands and require additional operating costs. On the other hand, conservation groups assert that the fees charged accurately reflect the deteriorating conditions of the rangeland. The conservation groups also contend that the fees do not cover the costs of management by the FS and BLM and, therefore, benefit the livestock producer. These groups finally contend that higher fees could optimize the potential of the rangeland.¹⁰⁹ Current Federal management policies are a reflection of earlier policies that used Federal Government resources to encourage settlement of the West.¹¹⁰

Grazing sheep on Federal lands in the United States amounted to 2.7 million animal unit months (AUM)¹¹¹ in 1994.¹¹² The fees paid for grazing on Federal land by AUM as reported by the FS for 1990-94 follows:

<u>Year</u>	<u>Fee</u>
1990	\$1.81/AUM
1991	1.97/AUM
1992	1.92/AUM
1993	1.86/AUM
1994	1.98/AUM

The January 1, 1994, appraised market value of grazing mature sheep on public rangelands in the United States ranged from \$3.51 to \$11.08 per head per month. The level of authorized nonuse of FS and BLM lands for grazing was about 18 percent. Permittees are allowed to let land authorized for grazing go unused up to 3 years. In some instances, permittees may be allowed to extend the 3-year period of nonuse. There are some views that the reason that the nonuse rate is high is that the FS and BLM grazing fees are not perceived as economical advantageous. In a paper written by Pepperdine University, the authors contend that the reason for the level of nonuse among the available supply of AUM capacity is in effect that these potential AUMs have been rationed out of use (emphasis included) by high grazing fees on the public lands.¹¹³ However, the authors point out that the grazing lands may very well be marginal and inaccessible BLM lands.¹¹⁴ In 1992, the latest year for which

¹¹⁴ *Ibid*.

data are available, Federal receipts from grazing fees totaled \$11.5 million.¹¹⁵

*Labor*¹¹⁶

Industry sources assert that the Immigration Reform and Control Act of 1986 (Public Law 99-603, 100 Stat. 3359, Nov. 6, 1986) has resulted in a shortage of qualified shepherds in the United States. That Act, among other things, permits the entry of seasonal agricultural workers only if qualified U.S. citizens and permanent-resident aliens are not available. Regulations issued by the Secretary of Labor concerning the labor certification process for temporary agricultural employment, commonly referred to as the H-2A program, authorize special procedures in the case of rangeland workers in view of the year-round nature of livestock management in the rangelands (see 20 CFR 655.93(b)). The workers under the rangeland provision come mostly from Mexico, Peru, Chile, Spain, France, and Mongolia. Industry sources report that the total cost of employees under the H2-A visa program averages about US\$1,500 to US\$1,800 per month.¹¹⁷

Under the mechanics of the program, the employer may notify the U.S. Department of Labor (DOL) of the need for the agricultural worker 60 days before the need. The employer must advertise for the position for 40 days and, if no suitable employee is found, the DOL will certify to allow a foreign employee during the next 20 days. In general, growers are required to advertise positions in newspapers and on the radio, while the DOL, the U.S. Immigration and Naturalization Service (INS), and state employment agencies search for qualified U.S. citizens and permanent resident aliens.

Regulations also require that workers under the H-2A visa program receive the same benefits that a domestic laborer would receive.¹¹⁸ The employer must demonstrate that suitable housing is available for the foreign worker and that the worker is covered by the Workmans' Compensation program. The visa must be obtained for the worker from the INS.

The great bulk of workers under the rangeland provision are reported to be shepherds. In recent years there have been approximately 1,100 applications per year under the rangeland provision. The number of jobs is more than the number of applications because the application may be for more than one worker, although the application is frequently for only one worker. Virtually all of the applications are in the Western Rangeland States. An

example of the number of applications and jobs (for 1991) is shown in the following tabulation:

	<u>Number of applications</u>	<u>Number of jobs</u>
California	360	457
Idaho	200	264
Wyoming	100	230
Colorado	100	164

Price Concerns

Some domestic growers have also expressed concern about the farm-retail price spread for live lambs and lamb meat. The farm-retail price spread is the difference between the price growers receive for the lambs they sell and the retail price of lamb meat. According to one industry source, the farm-retail price spread between live lambs and lamb meat is more than the spread between live cattle and beef and between live poultry and poultry meat partly because the U.S. lamb meat processing and distribution sector is less efficient than other sectors.¹¹⁹

The domestic industry expressed concern about an unusual development that occurred during the 1994 Easter/Passover lamb marketing season. The USDA described the situation in the following terms: "... This year's slaughter lamb prices have been a disappointment for producers hoping for a repeat of last year's record highs. Supply fundamentals were not significantly different within the lamb complex between years, yet prices this year were sharply lower through the Easter/Passover holidays. A potential cross-over effect from larger beef supplies and lower prices this year may have kept lamb prices under pressure. Other causes of the price weakness include a series of storms in January and February that disrupted East Coast distribution and kept consumers away from restaurants. An earthquake in southern California in January probably had a similar impact on away-from-home consumption. However, none of these factors adequately explains the wide difference in prices."¹²⁰ In 1995, prices returned to more usual trends.

Imports

During 1990-94, annual U.S. imports of fresh, chilled, or frozen lamb meat increased from 25 million pounds, valued at US\$31 million, to 39 million pounds, valued at US\$49 million (tables 2-12 and 2-13 and figure 2-5). Australia and New Zealand supplied virtually all U.S. lamb meat imports over this period.

Figure 2-5
Lamb meat: fresh chilled or frozen: U.S. Imports from Australia and New Zealand, 1990-94

Million pounds, carcass-weight equivalent

Source: Compiled from official statistics of the U.S. Department of Commerce.

During 1990-94, monthly imports ranged from a low of 1.4 million pounds, valued at US\$1.9 million during August 1990, to a high of 4.6 million pounds, valued at US\$5.9 million in June 1993. The share of imports to consumption has trended upward, as shown in figure 2-6. Lamb meat imports are typically more just before holidays, such as Easter. The majority of U.S. imports are frozen lamb meat, as shown in table 2-14.

Imports From Australia

U.S. imports of fresh, chilled, or frozen lamb meat from Australia increased from 13 million pounds in 1990, valued at nearly US\$14 million, to 23 million pounds, valued at US\$26.5 million in 1994 (tables 2-12 and 2-13). In 1994, Australia supplied 59 percent (by quantity) of total U.S. lamb meat imports. U.S. imports from Australia by HTS subheading are shown in table 2-15. Frozen bone-in cuts accounted for 56 percent (12.7 million pounds) of the subject imports during 1994, up considerably from 44 percent (5.9 million pounds) in 1990. Fresh or chilled bone-in cuts accounted for an additional 20 percent (4.5 million pounds) in 1994. Of the remainder, 14 percent (3.3 million pounds) consisted of frozen boneless lamb; 4 percent (0.9 million pounds), of fresh or chilled boneless lamb; 4 percent (0.9 million pounds), of frozen carcasses and half-carcasses; and 2 percent (0.5 million pounds), of fresh or chilled carcasses and half-carcasses.

Fresh lamb meat from Australia is flown to the United States in shipments of 50,000 to 60,000 pounds. The fresh lamb is typically available to the consumer within 3 to 4 days after the lamb is slaughtered in Australia. Frozen lamb meat is transported to the United States on refrigerated ships and is typically available to the retail consumer between 6 weeks to 4 months after the animal is slaughtered in Australia. Freight costs from Australia to the United States amounted to US\$0.85/lb for air freight and US\$0.17/lb for sea freight.¹²¹ The shares of fresh, chilled, or frozen lamb imported from Australia during 1990-94 are shown in table 2-14.

Imports From New Zealand

U.S. imports of fresh, chilled, or frozen lamb meat from New Zealand increased from 12 million pounds, valued at US\$17 million, in 1990 to 16 million pounds, valued at US\$22 million in 1994. New Zealand supplied 41 percent of total U.S. lamb meat imports in 1994. Table 2-16 shows that frozen bone-in cuts accounted for 72 percent (11.4 million pounds) of U.S. imports of lamb meat from New Zealand during 1994, up from 65 percent (7.5 million pounds) in 1990. Frozen boneless lamb accounted for 14 percent (2.3 million pounds), and fresh or chilled bone-in cuts accounted for an additional 9 percent (1.5 million pounds) in 1994. Of the remainder, 3 percent (0.5 million pounds) consisted of frozen carcasses and half-carcasses, and 2 percent (0.3 million pounds) consisted of fresh or chilled

boneless lamb. The shares of fresh, chilled, or frozen lamb imported from New Zealand during 1990-94 are shown in table 2-14.

New Zealand export interests report that, before 1986, nearly all lamb exports to the United States were frozen. New Zealand exports of frozen lamb meat to the United States typically come in shipments that weigh about 500,000 pounds, although 1-million-pound shipments may also occur. In past years, individual shipments of as much as 2.5 million pounds have occurred. There are eight New Zealand packer/processors authorized by USDA to ship lamb meat to the United States.¹²² The New Zealand Lamb Company, 50 percent of which is owned by three packers, is by far the largest importer of New Zealand lamb into the U.S. market.¹²³

U.S. Exports of Lamb Meat

Separate data are not available for U.S. exports of fresh, chilled, or frozen lamb meat because they are reported under a residual provision of *Schedule B*, which include mutton. However, U.S. exports of lamb meat apparently amount to less than 1 percent of U.S. production. U.S. exports of fresh, chilled, or frozen lamb meat and mutton totaled 8.3 million pounds, valued at US\$9.8 million in 1994. Major U.S. lamb and mutton export markets include Mexico and Canada. Mexico accounted for 50 percent of the quantity, but only 36 percent of the value.¹²⁴

U.S. Exports of Live Sheep and Lambs

During 1990-94, U.S. exports of live sheep and lambs increased from 473,000, valued at US\$15.7 million, to 788,000 animals, valued at US\$26.9 million (table 2-17). Mexico was the primary market. It is estimated that U.S. exports of live lambs to Mexico ranged between 71,000 animals in 1990 to about 136,000 in 1993 and amounted to 127,000 animals in 1994 (table 2-18).

Table 2-18 shows U.S. exports of live sheep and lambs to Mexico, estimated live lamb exports to Mexico, and the estimated quantity of meat derived from the lambs.

CHAPTER 3: AUSTRALIAN INDUSTRY

Structure and Operation of the Australian Industry

Live Sheep Inventory

Australia has the second largest sheep and goat inventory in the world¹ accounting for about 16 percent of the world's total (table 3-1).² According to the Australian Meat and Live-stock Corporation (AMLC), the number of sheep and lambs in Australia declined from 170 million animals in 1990 (fiscal year July 1-June 30) to 134 million in 1994 (table 3-2).³ In addition, the AMLC forecasts that the inventory of sheep in Australia as of January 1, 1995, was 127 million animals, down about 5 percent from the previous year.⁴ The AMLC reports that the decline in Australian sheep numbers reflects the declining profitability of wool production during the early 1990s and adverse production conditions resulting from drought.⁵ Consequently, many producers are changing to more profitable products, such as beef.⁶

Source: Australian Meat and Live-stock Corporation, *Statistical Review*, July 93-June 94, p. 4.

The Australian inventory of sheep and lambs by state and territory as of March 31, 1990-94, is shown in table 3-2. New South Wales accounted for about 35 percent of Australia's sheep inventory during 1994; Western Australia, for about 24 percent; Victoria, for 18 percent; South Australia, for 11 percent; Queensland, for 9 percent; and Tasmania about 3 percent (figure 3-1). The inventory in the Northern Territory showed fewer than 50,000 animals; the climate of the Northern Territory is generally not suitable for efficient sheep production. Indeed, neither the climate of most of northern Australia is suited to efficient sheep production nor that of most of south central Australia, which consists largely of the Great Victoria Desert.

In Australia, about 75 percent of the sheep are maintained for the production of wool.⁷ The Australian Merino breed accounts for virtually all of Australia's wool-type sheep. It is generally recognized as efficient in the production of very high-quality wool. As a result of breeding programs designed to adapt animals to various climatic conditions, four types of Australian Merinos have been developed: Superfine Wool Merino, Fine Wool Merino, Medium Wool Merino, and Strong Wool Merino. Although the Merino is efficient in the production of wool, it is generally recognized as relatively inefficient in the production of lamb meat. Merinos are usually sold for

⁷ The following discussion on breeds and types of sheep in Australia and the discussion on crossbreeding were adapted, for the most part, from AMLC, *Meat and Livestock in Australia*, Dec. 1990, pp. 22-23.

Figure 3-1

mutton after they reach 5 to 7 years of age and are no longer suitable for the production of wool.⁸

A large share of the lamb meat for the Australian market is derived from lambs that are the offspring of crossbred ewes. To derive ewes that produce lambs for the meat market, the most common cross is Merino ewes bred to long-wool rams, usually the Border Leicester breed. The Border Leicester breed contributes the genetic potential for high-volume milk production, and fast-growing maturing lambs. The aforementioned crossbred ewes, the so-called "first cross ewes," account for about 12 percent of the Australian inventory.

To produce high-quality lambs, so-called Australian prime lambs, for lamb meat, a common practice is to mate first cross ewes with short-wool, meat-type breeds, such as the Suffolk or Dorset. Short-wool, meat-type breeds account for about 4 percent of the Australian inventory. The remaining Australian sheep inventory, about 10 percent, consists of Merino-derived dual-purpose breeds kept for both wool and meat.

Growing Operations

The number of operations with sheep declined by 10 percent during 1991-93 as indicated in the following tabulation:⁹

<u>Year</u>	<u>Number of Operations</u>
1991 . . .	62,342
1992 . . .	59,589
1993 . . .	56,026

New South Wales accounted for 35 percent of the sheep operations in 1993, Victoria 24 percent, Western Australia 17 percent, and South Australia 16 percent. The amount of moisture available for pasture or for other crops is a primary factor influencing sheep operations in Australia.¹⁰ Other factors that influence management decisions are the relative profitability of wool and lamb meat, profitability of sheep raising in relation to such other agricultural alternatives as beef and grain, and weather.

⁸ Officials from the Australian Department of Primary Industries and Energy (DPIE) and officials of the Australian Bureau of Agricultural and Resource Economics (ABARE), interviewed by USITC staff, Canberra, Australia, Mar. 23, 1995.

⁹ Also referred to as establishments, Australian Bureau of Statistics, *Livestock and Livestock Products Australia*, 1992-93, Cat. No. 7221.0, Apr. 24, 1994, p. 10.

¹⁰ The following information on sheep management practices, grazing on government lands, costs of production, predator problems, lamb losses, and seasonality of lamb production in Australia was taken from a USITC staff interview with Sandy Troup, president, Sheepmeat Council of Australia, in Washington, DC, Feb. 7, 1995.

The moister sheep-raising regions of Australia receive 28 inches or so of rain annually and may have access to irrigation. Typically, such regions have mild Mediterranean-like climates that allow for outside lambing. These regions are often near urban areas, and land costs are relatively high. A typical operator in this region would produce meat-type lambs, have 500 to 1,000 ewes, and occupy about 500 acres. This farm would also likely produce a few beef cattle, small grains (barley and oats), and potatoes.

In parts of Australia with slightly less rainfall, a typical operation would maintain 3,000 to 9,000 sheep (consisting mostly of wool-type, but including some meat-type sheep) and occupy 1,500 to 3,000 acres. This farm would also raise some grain, but no cattle.

In dry regions of Australia, a typical operation would likely grow small grains and raise high-quality, meat-type lambs on the grain stubble and other grain by-products. A farm operated under this management style would have about 500 sheep and occupy 2,000 to 8,000 acres.

In very dry regions of Australia, sheep raising is limited to wool-type animals, with the meat production limited primarily to the slaughter of animals for mutton when they are too old to be suitable for the production of wool. A typical operation would have about 10,000 to 20,000 sheep and occupy 30,000 to 60,000 acres.

Australian predators of lambs and sheep include dingoes (wild dogs) and, in moister areas, red foxes that kill young lambs; however, detailed statistics are not available concerning losses to such predators. In Australia growers attempt to control dingoes and foxes through the use of Compound 1080 (sodium fluoroacetate), whereas in the United States the use of 1080 is restricted. Kangaroos are also serious competitors for pasture in dryer areas although shooting permits may be issued to control their numbers. Lamb losses may also occur because of unseasonable weather, that is, wet, cold weather that causes diseases in new-born lambs and/or hot/dry weather that results in poor pastures causing malnourished ewes that are unable to produce adequate milk for the lambs.

As in the United States, there are peak periods of lamb births and lamb slaughter in Australia. Seasonality reflects, among other things, the advantage of having lambs born and grown in the spring, when pastures are productive, and the seasonally polyestrous nature of the ewe. Estrus and ovulation in ewes occurs as days become shorter (seasonally). If the ewe is not impregnated she will continue to ovulate but the ovulation period in common domestic sheep breeds is limited to five to seven months.¹¹ Notwithstanding the seasonality of lamb production, lamb meat production occurs throughout the year, reflecting regional differences and producer attempts to have animals ready for slaughter throughout the year to avoid burdensome supplies and associated low prices.

¹¹ Sheep Production Handbook, 1988, ch. REPRO.

Meat Packing and Processing Sector

There are about 350 meat-packing establishments in Australia.¹² Most are older facilities, although certain establishments have been recently renovated. Most lamb-slaughtering plants in Australia are single species.¹³ There is typically little further processing of lamb at meatpacking plants for the domestic market--carcasses are shipped to butchers or retail outlets for fabrication into retail cuts. However, plants processing for the export market generally further process the carcasses into various cuts.¹⁴

Number of establishments, employment, and wage rates¹⁵

The number of meat-packing establishments¹⁶ in Australia declined from 390 in 1990 to 352 in 1992, or by 10 percent. Factors that contributed to the decline include a reduction in the beef herd and stricter government and industry hygiene and slaughter requirements. Meat packing establishments are located throughout Australia; however, major processing regions include Victoria, New South Wales, and southern Queensland. Australian officials report that there are numerous small establishments and that the top 20 firms account for about 48 percent of slaughter.¹⁷

Employment in the meat processing sector declined from 31,900 in FY90¹⁸ to 27,364 in FY92, or by 15 percent. Closure of plants and improved productivity contributed to the decline in employment. Wages and salaries in this sector declined from US\$599 million¹⁹ (AUS\$778 million) to US\$579 million (AUS\$753 million), or by 3 percent during the same period.²⁰ Average weekly wages in the meat packing sector by state ranged from US\$324 (AUS\$464) to US\$398 (AUS\$570) in May 1993, with Queensland having the highest wage rates and the Northwest Territory the lowest.²¹ Wages were generally higher in medium-size establishments, particularly in New South Wales, Queensland, and South Australia, and in export-licensed establishments in New South Wales and Victoria.²²

¹² Includes beef and veal, pigmeat, and sheepmeat establishments; separate data on the number of sheep and lamb packing establishments are unavailable.

²² Ibid.

Local and foreign ownership

Most of Australia's meat-processing plants are privately owned. Only 10 plants are owned by State and local governments.²³ In FY92, the latter accounted for 8.5 percent of the total Australian processing output.²⁴

Japan, the United Kingdom, and the United States are among the largest investors in the Australian meat-processing sector. Foreign owned establishments accounted for 10 percent of sheep and lambs slaughtered in 1988. Establishments with more than 50 percent Japanese ownership accounted for 5.4 percent of sheep and lambs slaughtered by foreign interest during this period.²⁵ The R.J. Gilbertson Proprietary Ltd is the largest foreign-owned (British) sheep and lamb slaughtering establishment in Melbourne.²⁶

Monfort, Inc. has an investment in the Australian meat sector through its ownership of Australian Meat Holdings (AMH). AMH is the largest meat company in Australia, with sales of US\$676.8 million (AUS\$880 million) in 1992.²⁷ According to ABARE officials, AMH has a plant in Victoria that slaughters mutton.²⁸ Beef accounts for most of the meat processed by AMH.

Lamb Meat Production, Consumption, and Prices

Production

Australian lambs slaughtered declined steadily from 16.8 million animals in 1990 to 15.0 million animals in 1994 (table 3-3). The decline apparently reflects the drop in the total sheep inventory and especially the fall in the number of ewes--from 80.8 million as of March 31, 1990, to 67.0 million as of March 31, 1994. Lamb meat production similarly declined steadily from 650 million pounds in 1990 to 584 million pounds in 1994 as shown in table 3-4. Australian lamb meat production by State and Territory is shown in table 3-5.

Source: Compiled from Australian Meat & Live-stock Corporation, Statistical Review, July 93-June 94, p. 9.

During 1994 production of sheepmeat (mutton and lamb) accounted for 22 percent of Australian meat production. Mutton production accounted for 13 percent, and lamb accounted for 9 percent (table 3-6).²⁹ However, as shown in the following tabulation, in FY 1994, the combined share of meat production accounted for by mutton and lamb and individual shares varied among States and Territories³⁰ within Australia (in percent):

	<u>Mutton</u>	<u>Lamb</u>	<u>Total</u>
Australia	13	9	22
States and territories:			
South Australia	29	18	47
Western Australia	29	11	40
Victoria	14	17	31
New South Wales	17	9	26
Tasmania	14	11	25
Queensland	2	1	3

²⁹ Mutton and lamb combined accounted for only about 1 percent of 1994 meat production in the United States.

³⁰ Mutton and lamb production in the Northern Territory is negligible.

Table 3-6

Meat,¹ mutton and lamb: Production in Australia and lamb and mutton as a share of meat production, by years, 1990-94²

Year	Production of			Share of production	
	Meat	Mutton	Lamb	Mutton	Lamb
	---- (Million pounds)-----			----- (Percent)-----	
1990	5,780	734	650	13	11
1991	6,012	834	636	14	11
1992	6,120	852	606	14	10
1993	6,168	818	602	13	10
1994	6,208	837	584	13	9

¹ Beef, veal (including buffalo), mutton, lamb, and pork.

² Fiscal year July 1-June 30.

Source: Compiled from Australian Meat & Live-stock Corporation, Statistical Review, July 93-June 94, pp. 8-9.

The percentage differences largely reflect State and Territorial climatic conditions. The relatively high share of mutton production in South Australia and Western Australia reflects the high share of wool-type sheep, which are generally more economical to raise in the dryer regions of Australia. Much of Queensland is too tropical to be efficient in the production of sheep but does have a competitive advantage in the production of cattle, especially Zebu (humped back) cattle. The relatively high proportion of mutton to lamb meat production (59 percent compared with 41 percent FY94) in Australia reflects the large share of the sheep population, including wethers³¹ that are kept solely for the production of wool.³²

Average lamb carcass weights in Australia during 1990-94 are shown in the following tabulation (in pounds):

1990	40
1991	37
1992	37
1993	40
1994	40

Lamb carcass weights in Australia average significantly less than those in the United States and generally reflect a genetically smaller animal that is usually finished on grass, not grain.³³

³¹ A wether is a male sheep that has been castrated before the development of secondary sex characteristics.

³² Lamb meat accounts for about 95 percent of combined lamb and mutton production in the United States.

³³ Gary Griffin, Senior Research Scientist, Lincoln University, interviewed by USITC staff, Armidale, New South Wales, Australia, Mar. 24, 1995.

Consumption

Lamb meat consumption in Australia declined by 12 percent during FY90-93 (table 3-7). The decline in consumption reflects both the previously discussed drop in production as well as an increase in exports, although an irregular increase. Consumption of lamb in Australia accounted for about 77 percent of total production in 1994.³⁴ Approximately 75 percent of lamb meat production (from the Australian sheep flock raised principally for the production of lamb meat) is consumed domestically.³⁵

Table 3-7
Red meat and poultry: Consumption in Australia, by types, 1990-93¹

Year	Red meat				Total red meat	Poultry	Total
	Beef and veal	Mutton	Lamb	Pork			
	----- (Million pounds, carcass-weight equivalent) ² -----						
1990	1,523	306	553	688	3,070	919	3,989
1991	1,541	291	535	681	3,048	933	3,981
1992	1,435	293	514	739	2,981	994	3,975
1993	1,440	328	485	734	2,987	1,014	4,001

¹ Data are for fiscal year July 1-June 30.

² Data for poultry are dressed weight.

Note.--Because of rounding, figures may not add to the totals shown.

Source: Data on red meat compiled from Australian Meat & Live-stock Corporation, *Statistical Review*, July 93-June 94, p. 20. Data on poultry meat compiled from USDA, Foreign Agricultural Service, *Livestock and Poultry: World Markets and Trade (FL&P 2-94)*, Oct. 1994, p. 99.

Lamb meat consumption in Australia accounts for a much larger, although declining, share of red meat consumption and of combined poultry and red meat consumption than it does in the United States. The share of such consumption is shown in the following tabulation (in percent):³⁶

Year	Red meat consumption	Red meat and poultry consumption
1990	18	14
1991	18	13
1992	17	13
1993	16	12

³⁴ AMLC, *Statistical Review*, July 93-June 94, p. 20.

³⁵ AMLC prehearing brief, p. 7.

³⁶ AMLC, *Statistical Review*, July 93-June 94, p. 20.

The declining shares accounted for by lamb meat reflects both a drop in lamb meat consumption and an increase in consumption of alternative meats, principally chicken.³⁷

Prices

Table 3-8 shows the price received by growers for lambs marketed in New South Wales, Victoria, and South Australia during January 1990 through the first half of 1994. South Australia and Victoria account for most of the lamb meat exported to the United States. New South Wales, the location of a large share of Australia's human population, is considered representative of the Australian domestic market.³⁸ The prices are for lambs that are estimated to yield carcasses that weigh between 40 to 44 pounds, the size typically used for exports to the United States.

The prices of such live lambs in Australia are, on average, below prices in the United States. However, it should be noted that there are important differences between animals in the two countries, specifically, lambs in the United States are typically larger and hence yield larger carcasses.

Lamb carcass prices in Australia are reported by the New South Wales Meat Industry Authority. These data represent prices received by Australian growers who sell directly to packers on a dressed-weight basis (carcass basis). Prices are reported weekly and are classified by weight and by fat score. Table 3-9 shows average monthly carcass prices received by growers for weight class 18-20 kg (40-44 pounds), with a fat score of 3 for the period February 1994 through April 1995.³⁹ Prices received by growers ranged from a low of US\$.44 a pound (AUS\$1.33 per kg) in June 1994 to a high of US\$.61 a pound (AUS\$1.90 kg) in February and March 1994. The prices growers receive for lamb carcasses in Australia are lower than prices received by U.S. farmers, reflecting in part, the smaller size carcasses derived from Australian lambs.

Retail lamb prices in Australia by selected cities are shown in table 3-10. These prices include cuts from lambs that are estimated to yield carcasses that weigh between 18 to 35 pounds. Retail prices for Australian leg and loin chops generally declined during 1991-93, reflecting a decline in total supply, as well as a decline in demand. Such prices increased in 1994, reflecting shortages of good quality lambs as a result of long-term drought and a stronger demand for lamb since beef prices increased.⁴⁰

Production Costs and Profitability⁴¹

Live Lamb Sector

Appendix H shows average per farm cost of production and profits for the Australian sheep industry. During FY91 through FY93, major cost components per sheep farm included marketing, interest, wages, salaries and supplements, livestock purchases, payments to contractors, repairs and maintenance, fuel, fertilizer, and veterinarian services. Marketing costs and interest paid were the largest costs incurred per farm. Marketing costs include such costs as commissions, packaging, and freight. Marketing costs declined during the period from US\$21,184 (AUS\$27,000) to US\$10,123 (AUS\$14,400) per farm. Interest paid declined from US\$14,515 (AUS\$18,500) to US\$10,123 (AUS\$14,400). Costs per farm for wages and salaries ranged from a low of US\$8,383 (AUS\$10,900) in FY92 to a high of US\$11,848 (AUS\$15,100) in FY91. Purchases of livestock, another major cost, ranged from US\$5,384 (AUS\$7,000) in FY92 to US\$6,960 (AUS\$9,900) in FY93. Payments to contractors declined from US\$9,152 (AUS\$11,900) to US\$6,749 (AUS\$9,600) and include payments for wool shearing, classing, and also for contract work for nonagricultural activity. Repairs and maintenance declined by 15 percent, totaling US\$5,905 (AUS\$8,400) per farm in FY93. Fuel expenses also declined from US\$5,335 (AUS\$6,800) to US\$4,359 (AUS\$6,200) during the period. Per farm fertilizer cost totaled US\$2,882 (AUS\$4,100), and veterinarian cost per farm totaled US\$2,671 (AUS\$3,800) in FY93.

Data on profitability per sheep farm during FY91 through FY93 are also shown in appendix H. The average cash-operating surplus⁴² per sheep farm declined from US\$13,731 (AUS\$17,500) in FY91 to US\$1,769 (AUS\$2,300) in FY92, then rose to US\$8,928 (AUS\$12,700) in FY93. Sales of livestock products declined from US\$79,794 (AUS\$101,700) to US\$43,375 (AUS\$61,700) and accounted for 54 percent of receipts (turnover) in FY93. Sales of livestock increased from US\$14,998 (AUS\$19,500) per farm in FY92 to US\$24,043 (AUS\$34,200) in FY93 and accounted for 30 percent of receipts in the latter year.

During FY92, sheep farms had a rate of return on farm-operating costs of 2.3 percent, or, for every \$100 of farm-operating costs, \$2.25 of cash-operating surplus was generated. For FY93, the rate of return on farm operating costs was 12.1 percent reflecting a 13 percent increase in returns from sales.

⁴¹ The following information on cost and profitability was adapted from Australian Bureau of Statistics, *Agricultural Industries Financial Statistics Australia, 1992-93*, Catalogue No. 7507.0, July 25, 1994.

⁴² Cash-operating surplus is the estimate of gross-operating surplus, minus an estimate of the value of increase in livestock, and estimates of interest and land rent paid, plus estimates of interest and land rent received. Depreciation and income tax have not been deducted from cash-operating surplus. See 1992-93 *Agricultural Industries Financial Statistics Australia*, p. 50.

Meat Packing and Processing Sector

An official of the Tatiara Meat Company Pty. Ltd., the largest Australian lamb meat exporter to the United States, reported that major cost incurred by the Australian meat packing and processing sector include cost of livestock, labor, slaughter levies, transportation cost, and fees for the Department of Primary Industries and Energy's (DPIE) Australian Quarantine and Inspection Service's (AQIS) health inspectors and veterinary officers.⁴³ In Australia, transportation costs from Bordertown, to Melbourne (chiller plant location) are US\$519 (AUS\$750) in 1994 per semi-truck, and from Bordertown to Sydney US\$1,245 (AUS\$1,800) per semi-truck. Costs incurred from freezing and storage of lamb meat are US\$0.09 (AUS\$0.13) per kilogram and US\$0.10 (AUS\$0.15) per carton (a carton equals 20 kilograms), respectively. Normal storage of frozen product is 4 weeks. The same official also reported that Tatiara currently employs 15 inspectors at a cost of US\$55,344 (AUS\$80,000) per inspector.

The use of AQIS health inspectors and veterinarians is mandatory for all meat export establishments. As of January 1, 1991, the meat industry has been responsible for AQIS charges on a fee-for-service basis for each inspector and veterinary officer employed. During FY93, the industry paid an average of US\$48,626 (AUS\$69,169) for each full time meat inspector and of US\$69,115 (AUS\$98,314) for each veterinary officer. Total AQIS inspection cost to the meat industry exceeded US\$56 million (AUS\$80 million) in FY93 and amounted to between 2 and 5 percent of the meat processing industry's cost.⁴⁴

The following tabulation shows the major cost components, by share of total cost, for sheep lamb packing and processing establishments operating in the domestic and export markets in FY93 (in percent):⁴⁵

<u>Costs</u>	<u>Domestic</u>	<u>Export</u>
Livestock costs:		
Purchases	72	68
Procurement cost	<u>3</u>	<u>3</u>
Subtotal	75	71
Processing costs:		
Labor	10	11
Materials and services	8	8
Fixed costs	<u>2</u>	<u>2</u>
Subtotal	20	20
Delivery costs	<u>5</u>	<u>9</u>
Total costs	100	100

⁴³ Jack Erichsen, plant manager, Tatiara Meat Co., interviewed by USITC staff, Bordertown, Australia, Mar. 22, 1995.

⁴⁴ Meat Processing, vol. II, Apr. 20, 1994, pp. 99-100.

⁴⁵ Ibid., vol. I, pp. 32-33.

The price of livestock is the major input cost for the lamb meat-packing and processing sector. Labor is the next highest cost accounting for 10 to 11 percent of total costs. Delivery, which accounted for 5 percent of the domestic cost, accounted for 9 percent of costs for export. Because of the level of processing required to produce products of different quality levels, the various cost components differ considerably as a proportion of total processing cost between establishments. However, labor costs accounted for the largest proportion (excluding livestock) of total costs.⁴⁶

One measure of profitability in the meat-packing industry is the gross profit margin (GPM) (sales revenue after all expenses have been paid). Based on a survey conducted by the Australian Bureau of Statistics, about a quarter of the sample⁴⁷ reported gross losses, half reported gross profit margins between 4.5 and 15 percent, while many slaughter plants reported much higher gross profit levels.⁴⁸

Wool Production

Australia is by far the world's leading producer of wool, accounting for between 32 percent (1994) and 37 percent (1990) of reported world production in marketing years⁴⁹ 1990/94 (table 3-11). The estimated value of such production declined by 62 percent during the period, totaling about US\$2 billion in 1994.⁵⁰

Exports

Lamb Meat and Mutton

During FY 1990-94, Australian exports of lamb meat rose irregularly from 87.6 million pounds (shipped weight),⁵¹ valued at US\$84 million (AUS\$109 million), in FY90 to 127 million pounds, valued at US\$134 million (AUS\$194 million), in FY94, or by 45 percent in quantity and 60 percent in value (table 3-12). Exports also rose irregularly as a share of Australian lamb meat production from 14 percent in FY90 to 23 percent in FY94, reflecting decreased production as well as irregularly rising exports (table 3-4). Lamb meat's share of the value of Australia's exports of all meats increased

⁴⁶ Ibid., p. 35.

⁴⁷ An overall data base of establishments surveyed was created by merging data on establishments from the Australian Bureau of Statistics and a survey conducted by the Australian Industry Commission on meat processing. The final data base consisted of 101 establishments.

⁴⁸ *Meat Processing*, vol. II, Apr. 20, 1994, p. 37.

is thought to reflect their relatively large share of meat-type sheep and their relatively small share of the Australian human population (especially, Western Australia and South Australia). The share of lamb meat production that is exported by the Australian States and Territories is also shown in table 3-15.

Australian exports of mutton increased irregularly from US\$147 million (AUS\$191 million) in FY90 to US\$219 million (AUS\$316 million) in FY94 (table 3-13). Mutton's share of the value of Australia's exports of all meats increased irregularly from 7 percent in FY90 to 8 percent in FY94. The Middle East, Japan, the European Union (EU), and Papua New Guinea have been major markets for Australia's exports of mutton; the United States has been a relatively small market.

Exports to the United States

Australian exports of lamb meat to the United States increased from 15 million pounds, valued at US\$17 million (AUS\$22 million), in FY90 to 24 million pounds, valued at US\$26 million (AUS\$38 million), in FY94 (table 3-12). During FY90-94, the United States was the largest single market (in terms of value) for the Australian exports of lamb meat in FY90, FY93, and FY94 (table 3-12). The annual share of Australian lamb meat exports to the United States is shown in the following tabulation (in percent):

<u>Year</u>	<u>Quantity</u>	<u>Value</u>
1990	17	20
1991	13	13
1992	17	16
1993	16	18
1994	19	19

Other markets

Other important markets for Australian lamb meat include Japan, the EU and Canada. Australian exports of lamb meat to Japan increased from 7 million pounds, valued at US\$12 million (AUS\$16 million), in FY90 to 19 million pounds, valued at US\$25 million (AUS\$36 million), in FY94 (table 3-12). The AMLC cited the devaluation of the Australian dollar against the yen and promotion programs as causes for the increasing demand for Australian meat in Japan in FY94.⁵³

The EU has been the other leading market for Australian exports of lamb meat with total exports increasing from 9 million pounds, valued at US\$12 million (AUS\$16 million), in FY90 to 17 million pounds (13 percent), valued at US\$24 million (AUS\$35 million), in FY94 (table 3-12). Exports of sheep meat and/or goat meat to the EU have been subject to a voluntary restraint agreement of 17,500 metric tons (38.6 million pounds) carcass-weight equivalent, with no duties or levies payable. After 1995, access arrangements are to be changed from a voluntary restraint agreement to a quota system, meaning that Australia would be allowed to supply products in excess of any quantitative limit but at, what the AMLC describes, a prohibitive rate of duty.⁵⁴ Within the 17,500 metric ton quota, a subquota of 4,000 metric tons (8.8 million pounds) on chilled lamb meat exports was negotiated to be removed; but the AMLC contends that there will be little effect since Australia has rarely filled the subquota.⁵⁵

Australian exports of lamb meat to Canada increased from 4 million pounds, valued at US\$5 million (AUS\$6 million), in FY90 to 5 million pounds, valued at US\$8 million (AUS\$11 million), in FY94 (table 3-12). The AMLC cited

⁵³ AMLC, *Annual Report 1993-1994*, pp. 21-22.

⁵⁴ *Ibid.*, p. 31.

⁵⁵ *Ibid.*, p. 31.

the FARL promotion program as increasing demand for Australian meat in FY93-94.⁵⁶

Live Sheep Exports

Australian exports of live sheep increased irregularly from 4.5 million animals, valued at US\$89 million (AUS\$116 million), in FY90 to 5.3 million animals, valued at US\$98 million (AUS\$141 million) in FY94 (table 3-16). Australian exports of live sheep include those for slaughter, mostly to the Middle East (Kuwait, the United Arab Emirates, Oman, and others), and sheep for breeding purposes to many countries throughout the world. Moslem (halal) religious slaughter requirements and Arab social customs account for this demand for exports of sheep and lambs for slaughter.

Australian exports of sheep for slaughter declined from 5 million animals in FY90 to 3 million in FY91 but increased to 4 million in FY92 as shown in table 3-16. The increase in FY92 reportedly reflected, in part, the return to normal on markets in Kuwait and in other Arab countries following the end of the Gulf War.⁵⁷ No exports of sheep for slaughter to the United States apparently existed during FY90-94. A shipment of 47,602 sheep for breeding purposes was made to Mexico during the 1991/92 marketing year.⁵⁸ Australian exports of live sheep to Saudi Arabia, once a major market, ceased during 1989 because of problems with "health" and protocol.⁵⁹ Consequently, Australian live sheep were exported to neighboring countries (primarily to the United Arab Emirates and Kuwait). These sheep were slaughtered and the chilled product was exported to Saudi Arabia.⁶⁰ Exports of live sheep to Saudi Arabia resumed in March 1995.⁶¹

Wool Exports

Australian exports of wool decreased from 948 million pounds (clean basis) in the 1990 marketing year⁶² to 861 million pounds in 1991 but then increased irregularly to 1,083 million pounds in 1994 (table 3-11). The Commission's estimate of the value of Australia's exports of wool during the

Table 3-16

Live sheep and lambs: Australian exports for slaughter and for breeding purposes to all markets, 1990-94

Item	1990	1991	1992	1993	1994
<i>(1,000 animals)</i>					
Sheep for slaughter	4,490	3,189	4,299	5,007	5,315
Sheep for breeding purposes	8	3	53	18	4
Total	4,498	3,192	4,352	5,025	5,319
<i>(Million US dollars)</i>					
Sheep for slaughter	86	90	65	81	97
Sheep for breeding purposes	2	1	2	1	1
Total	89	91	68	82	98

Note--Because of rounding, figures may not add to the totals shown.

Source: Data were compiled from Australian Meat & Live-stock Corporation, *Statistical Review*, for 1990, July 91-June 92, p. 24; for 1991, July 92-June 93, p. 24; and for 1992 to 1994, July 93-June 94, p. 32.

marketing years 1990/1994 are shown in the following tabulation (in millions of U.S. dollars):

<u>Marketing year</u>	<u>Value</u>
1990	3,065
1991	2,047
1992	2,421
1993	1,768
1994	1,858

Most of the wool produced in Australia is exported. As shown in table 3-11, exports were equivalent to between 56 percent and 94 percent of production during 1990-94 and averaged 76 percent. The years of relatively low exports appear to be years in which inventories increased. Australia was by far the world's largest exporter of wool during 1990-94, accounting for between 59 percent (1991) and 67 percent (1993) of reported world wool exports (table 3-11).

Australian Meat Identification System

Australia does not have a comparable "grading" system to that used in the United States;⁶³ its system describes the product based upon the weight and fat range measurements of the lamb carcass.⁶⁴ Although export establishments must be accredited by AUS-MEAT,⁶⁵ accreditation by domestic establishments is voluntary. The Australian carcass description system is reported in AUS-MEAT *Sheepmeat/Goat Language*, September 1994, and specifies certain objective carcass parameters.

The Australian system describes "sheep basic categories" and "sheep alternative categories" based primarily on dentition, that is, the maximum number of permanent teeth, and on sex. The Australian "sheep alternative category" description for "young lamb" (no permanent teeth), appears to be essentially the same as what is referred to as "lamb" in the United States. The Australian "sheep alternative category" description for "hogget" (1 or 2 permanent incisors, castrate male and female, no secondary sex characteristics) appears to be similar to what is referred to as "yearling mutton" in the United States. The Australian "sheep alternative categories" described for "ewe mutton" and "wether mutton" (1 to 8 permanent incisors, female, and castrate male with no secondary sex characteristics) appears to be similar to what is referred to as "mutton" in the United States.

Sheepmeat/Goat Language also provides for 11 "weight classes" beginning with "weight class 8" (carcasses up to 8 kilograms) and continuing at 2 kilogram intervals until "weight class 28" (carcasses of 28 kilograms). The USDA grading system does not generally make distinctions for carcass weights, although some price reporting is done based on carcass weight distinctions. In addition, "Sheepmeat/Goat Language" describes limits to carcass trimming.

The publication also describes "sheepmeat fat classes." Fatness of a carcass is described by class on a 1 to 5 scale, "class 5" being the fattest. The Australian "sheepmeat fat classes" appears to be similar in concept to the USDA "yield grades."⁶⁶

⁶³ AMLC prehearing brief, Mar. 29, 1995, p. 7.

⁶⁴ Ibid.

⁶⁵ AUS-MEAT is part of the AMLC, described in the section of this report entitled "Australian Federal Government Programs."

⁶⁶ In addition to *Sheepmeat/Goat Language*, AUS-MEAT has published the *Handbook of Australian Meat*, 5th ed. 1993, which was designed to facilitate Australia's meat trade domestically and overseas. It provides names, item numbers, detailed specifications, and colored pictures for wholesale and retail cuts of the following meats: sheep (lamb, hogget, and mutton); beef; buffalo; goat; and offals.

Australian Government Assistance⁶⁷

Australian Federal Government Programs

A number of programs affecting the Australian agricultural industry are operated by the Australian Department of Primary Industries and Energy (DPIE).⁶⁸ These programs are operated through "Sub-programs," and those that appear to directly affect sheep and lamb producers are described below.⁶⁹

Rural Adjustment and Services Sub-program

The purpose of the Rural Adjustment and Services Sub-program is to encourage the economic potential of the rural sector; and redress barriers to rural people's access to the full range of Government and of other social, economic, and rural services.

The Rural Adjustment and Services Sub-program for FY94 reoriented the Rural Adjustment Scheme (RAS) and further developed and implemented new measures announced by the Australian Federal Government in September 1992. RAS, established in 1977, is an Australian Federal Government financial assistance program for farmers administered by States or Territories.⁷⁰ This program is generally authorized for a 4-year period. The current RAS 1992, which became effective on January 1, 1993, replaced the RAS 1988.

The new objective is toward improved farm productivity, profitability, and sustainability or toward farm exit. Previously, the objective had been to assist farmers in trouble. However, the RAS also provides for additional assistance to eligible farmers in cases of exceptional circumstances that could not reasonably be expected to be accommodated within a farmer's normal risk-planning and management activities.

Financial assistance is available for both "normal" and "exceptional circumstances." The following tabulation shows the number of applications received, as well as the number approved for assistance under normal RAS and under exceptional circumstances for FY94.⁷¹

⁶⁷ Wool programs are included in this review because these programs are applicable to the wool derived from all sheep, including "meat types."

⁶⁸ Tom Grealy, First Secretary (Commercial), Embassy of Australia, USITC staff interview, Washington, DC, February 1995.

⁶⁹ The information in this section on the Department of Primary Industries and Energy (DPIE) and its sub-programs is principally from *Department Of Primary Industries and Energy, Annual Report, 1993-94*, except as noted.

⁷⁰ The information on the RAS is from *Rural Adjustment Scheme Advisory Council, Annual Report 1993-94* (Canberra: Australian Government Publishing Service), and from *Department of Primary Industries and Energy, Annual Report, 1993-94*.

⁷¹ July 1, 1993, to June 30, 1994.

<u>Type</u>	<u>Total applications</u>	<u>Approved applications</u>
Normal RAS	8,898	6,299
Exc. circumstances	<u>7,724</u>	<u>5,583</u>
Total	16,622	11,882

"Normal" assistance includes support to improve farm productivity, enhance skills, and to re-establishment grants. A re-establishment⁷² grant of up to US\$31,131 (AUS\$45,000) is available per farmer if it is determined that the farming enterprise has no longer prospects of long-term viability.

"Exceptional circumstance" assistance includes support to farmers for severe and prolonged drought, rain, and "low" wool prices. The Australian Federal Government provides 90 percent of the funding for normal expenditures, and the States and Territories provide the remaining 10 percent. Funding for exceptional circumstances is provided on a 90:10 basis for interest "subsidies" of up to 50 percent of interest payable and on a 50:50 basis for "subsidies" exceeding 50 percent of interest payable.

Table 3-17 shows details of RAS expenditure by the Australian Federal Government and the States for July 1, 1993, to June 30, 1994. RAS expenditure for FY94 totaled US\$119.2 million (AUS\$172.3 million). The Federal Government provided US\$104.0 million (AUS\$150.3 million) in total RAS expenditures (US\$74.9 million in normal and other, including administration expenses, and US\$29.1 million in exceptional circumstance expenditures), or 87 percent of total RAS expenditures. Expenditures provided by the States totaled US\$15.2 million (AUS\$22.0 million), or 13 percent of total expenditures.

Exceptional circumstance expenditures accounted for US\$40.8 million (AUS\$59.0 million), or 35 percent of RAS assistance during FY94. Assistance to wool growers accounted for 43 percent, drought assistance to cattle and grain producers (primarily in Queensland and, to a lesser extent, New South Wales) for 32 percent, and rain assistance primarily in Southern Australia for 25 percent.

Normal expenditures (not including other or administrative expenditures) totaled US\$24.2 million (AUS\$35.0 million), or 20 percent of total RAS 1992 expenditures. Farm productivity accounted for 47 percent, and grants to re-establishment accounted for 46 percent of such assistance. Expenditures in FY94 under RAS 1988 (funding commitments) and administration totaled US\$54.2 million (AUS\$78.3 million), or 45 percent.

Under the new RAS, export levies for promotion, marketing, and research and development were collected and disbursed. Under the levies management program, US\$146 million (AUS\$211 million) in wool tax was collected by the Australian Tax Office and distributed by the DPIE Levies Management Unit to the wool corporations.

⁷² Re-establishment means that a farmer exits farming and that the grant is payable only after the farmer has exited the farm.

¹ Fiscal year July 1 through June 30.

Source: Rural Adjustment Scheme Advisory Council, Annual Report 1993-94 (Canberra, Australian Government Publishing Service, Nov. 21, 1994), p. 50.

Expenditures for the Rural Adjustment and Services Sub-program for FY94 were US\$340 million (AUS\$492 million). These expenditures represent assistance to various farm sectors, but data are not available to isolate assistance to live lamb and sheep growers, except for the management of the wool tax, which is paid by growers.⁷³

The Livestock and Pastoral Sub-program

The purpose of the Livestock and Pastoral Sub-program is to promote increased market access and improved competitiveness for livestock and pastoral industries; to provide for efficient production and marketing systems; and to enhance industry's preparedness to deal with exotic diseases; and to improve animal welfare.

Expenditures for the Livestock and Pastoral Sub-program for FY94 were US\$428 million (AUS\$618 million).⁷⁴ These expenditures represent assistance to various farm sectors, the amount of assistance to live lamb and sheep growers cannot be isolated.⁷⁵

Quarantine and Inspection Sub-program

The purpose of the Quarantine and Inspection Sub-program, which is administered by AQIS is to deliver effective and efficient quarantine and food inspection services that meet and are responsive to the needs of industry, consumers and the Australian Government and that fulfill Australia's international obligations and treaty requirements.⁷⁶

Expenditures for the Quarantine and Inspection Sub-program for FY94 were US\$117 million (AUS\$169 million). As with other subprograms, the expenditures represent assistance to various farm sectors.⁷⁷

The Agricultural and Resource Economic Analysis Sub-program

The purpose of the Agricultural and Resource Economic Analysis Sub-program, which is the responsibility of the Australian Bureau of Agricultural and Resource Economics (ABARE), is to provide economic information to Australia's primary and energy industries.

⁷³ Facsimile transmission from counsel for AMLC, Feb. 13, 1995.

⁷⁶ *Department of Primary Industries and Energy, Annual Report, 1993-94*, p. 81.

⁷⁷ Reynolds, ABARE, interviewed by USITC staff, Canberra, Australia, Mar. 23, 1995.

Expenditures for the Agriculture and Resource Economic Analysis Sub-program for FY94 were US\$11 million (AUS\$16 million). As with other sub-programs, the expenditures represent assistance to various farm sectors.⁷⁸

Public grazing lands

According to the ABARE, there is some stock grazing on Government-owned lands (Crown Lands).⁷⁹ Such lands are generally leased by state governments to stock growers. Leases are good for 99 years and made available on a commercial basis, that is, market rate. Frequently, a farmer who grazes livestock on Crown lands owns adjacent lands (freehold). Sheep operations in such lands may occupy 12,000 to 100,000 acres and may raise almost exclusively wool-type sheep. The leased regions are estimated to sustain 10 to 15 percent of the total Australian sheep population at some time during the year. Leased lands have a reputation of being too dry for grain growing.⁸⁰

Measures of assistance

Nominal and effective rates of assistance are calculated by the Bureau of Agricultural Economics (BAE). The nominal rate is the percentage by which government assistance allows the average gross returns per unit of output to increase, relative to the supposed situation in which no assistance is provided.

The effective rate measures the percentage increase in returns to an industry resulting from government assistance, as a proportion of the returns to that industry if there were no government assistance.⁸¹ Table 3-18 shows the nominal and effective rate of assistance to the Australian beef, wool, and sheepmeat industries, for FY91 through FY93.

Assistance to wool increased growers' average gross returns by 18 percent in FY93; however, assistance was expected to decline after the last grant for wool promotion at the end of FY94. The effective rate of assistance for sheepmeat declined from 9 to 5 percent over the period.

Australian Federal Government Statutory Authorities

The Australian Meat and Live-stock Corporation⁸²

The Australian Meat and Live-Stock Corporation (AMLC) is a statutory authority with the prime responsibility of facilitating the marketing of Australian meat and livestock both domestically and in foreign markets. The AMLC is funded primarily through industry levies.

The AMLC's overriding objective is to enhance the profitability of all sectors of the meat and livestock industry by maximizing the opportunities in Australia and overseas. The AMLC has four specific strategies to accomplish its overriding objective: to secure and protect the best possible access to international and domestic markets to advertize and promote AMLC's members' products, to assure quality and customer satisfaction throughout the marketing chain, and to provide market intelligence. The AMLC is constituted under the authority of the Australian Meat and Live-Stock Act, 1977.

Formal committees of the AMLC include, but are not limited, to the (1) AUS-MEAT Committee, (2) the Computer Assisted Livestock Marketing Committee, and (3) the Lamb and Sheepmeat Promotion Committee.

⁸² The description of the AMLC in this section is principally from the *Australian Meat and Live-stock Corporation 1993-1994 Annual Report*, except as noted.

AUS-MEAT Committee⁸³

AUS-MEAT is the AMLC committee responsible for industry-trading language, standards, and plant accreditation.⁸⁴ Under government regulations, all export establishments in Australia have to be accredited by AUS-MEAT. Domestic operations may be accredited voluntarily. Accreditation requires plants to achieve a score from 1 to 5 (with 1 being the highest) for a number of procedures on the slaughter floor, in the boning room, offal room, load out and cold store, and in portion-cutting process. During fiscal year 1994, 23 new plants were accredited, and, as of June 30, 1994, there were 200 accredited plants for all species of livestock, including for, but not limited to, lambs.

Computer Assisted Livestock Marketing

The Marketing Services Division (Division) of the AMLC services the information needs of the AMLC and of the industry in general. The Division produces a number of price and market publications including Computer Assisted Livestock Marketing (CALM). This system is an Australia-wide marketing network that is auction based and uses sales by description for trading cattle, sheep, lambs, and pigs. When marketing under the CALM system, livestock remain on the producers' property or in the feedlot. A CALM representative (assessor) visits the property or feedlot, examines the livestock and estimates the carcass weight and fat cover. The assessor then describes the animals according to breed, weight, and fat score in the network, and the livestock are entered in an auction lot.⁸⁵

During FY94, lambs listed with CALM reached 429,721, and sheep listings reached 1.1 million.⁸⁶ Virtually all processors in Australia purchased sheep through the CALM at some point during the year, and some firms were able to greatly expand their range of buying areas. During the last part of FY94, the CALM was able to facilitate the sale of live sheep for export. Under the CALM, an increasing number of lambs are sold on a dressed weight basis, and CALM plans to expand its market to include wool. Beginning in June 1994, the CALM established an electronic market for sheep and lamb skins. Also, during FY94, CALM established an electronic bulletin board operated by the CALM Market Intelligence Unit to provide market information electronically, with users being charged for the time they are connected to the system. Information on the system includes market commentary, exchange rate movements, and wool market reports and information supplied by the Marketing Services Division of the AMLC.⁸⁷

⁸³ Publications of AUS-MEAT include *The Handbook of Australian Meat and Sheepmeat/Goat Language*.

⁸⁴ AMLC, 1993-1994 Annual Report, p. 35.

⁸⁵ Dr. Peter Barnard, divisional manager of AMLC, USITC staff interview, Sydney, Australia, Mar. 20, 1995.

⁸⁶ AMLC, 1993-1994 Annual Report, pp. 39-41.

⁸⁷ Ibid.

The Division also administers export quota systems and licenses livestock and meat exporters.⁸⁸ The licensing of exporters is a legislative authority. Applicants for licenses must meet certain standards of integrity, competence, and financial standing. An export license is subject to the condition that the holder shall comply with orders and directions of the AMLC. As of June 30, 1994, there were 379 meat exporters and 135 livestock exporters with licenses.⁸⁹ During FY94, 44 meat and 14 livestock export licenses were issued; 46 meat and 12 livestock export licenses were surrendered or expired.⁹⁰

Lamb and Sheep Meat Promotion Committee

Since 1988, the AMLC has fostered the Fresh Australian Range Lamb (FARL)⁹¹ program, which involves the promotion and sale of specified lamb meat directly to the North American consumer. All lamb meat marketed under the FARL program must carry the FARL logo and can be sold only through authorized importers and retailers as agreed to by the AMLC. Participants in the FARL program, which include Australian exporters and U.S. importers and retailers, are required to sign letters of agreement with the AMLC governing the use of the logo. The FARL program specifications call for chilled primal and subprimal cuts only, packaged and cut to previously agreed specifications and derived from carcasses that have met program specifications.⁹² Any new or different specifications must be approved by AUS-MEAT.

The FARL program requires, among other things, that the meat be derived from animals that have been grown primarily on pasture conditions but does not exclude lambs that have been finished on grain, improved pasture conditions, or on any other form of supplementary feeding. The FARL program also requires participants to conform to a code of practice during the preparation of the product, which starts out with the handling of the animals before slaughter and includes special attention to the temperature of the product at all stages of production and during transport. Under the FARL program, the product must be vacuum packed in packaging that meets specifications. Lamb marketed under the FARL program is flown directly from Australia to North America to ensure the delivery time remains around 72 hours from Australian producer to the American retailer.

⁸⁸ Ibid., p. 44-45.

⁹¹ The information in this section on the Fresh Australian Range Lamb Program is from the AMLC's *Fresh Australian Range Lamb Product Specification and Code of Conduct*, rev. ed. Jan. 1991, and *Fresh Australian Range Lamb Product Guide*, rev. ed., Mar. 1991, except as noted.

⁹² The FARL program is not applicable to frozen lamb meat.

AMLC expenses and revenues⁹³

Total operating expenses for the AMLC for the fiscal year ending June 30, 1994, were US\$67.2 million (AUS\$97.2 million), down from US\$69.7 million (AUS\$99.1 million) in the previous year. Expenses for export marketing, which include expenses for beef, as well as lamb, in North and South America for the fiscal year ending June 30, 1994, were US\$6.8 million (AUS\$9.8 million), down from US\$10.1 million (AUS\$14.4 million) in the previous corresponding year.⁹⁴ Expenses for export marketing in North Asia averaged US\$17.0 million (AUS\$24.0 million) in the 2 years, and export marketing expenses for all markets averaged US\$32 million (AUS\$46 million) in the 2 years. Marketing expenses in Australia averaged US\$17 million (AUS\$24 million) in the 2 years.

Total operating revenues for the AMLC for the fiscal year ending June 30, 1994, was US\$67.4 million (AUS\$97.5 million), down from US\$71.1 million (AUS\$101.1 million) in the preceding year. Slaughter levies (a charge applied for animals slaughtered) and export charges collected for live sheep and lambs for the fiscal year ending June 30, 1994, were US\$15.4 million (AUS\$22.3 million), down from US\$16.0 million (AUS\$22.8 million) in the year ending June 30, 1993. The slaughter rates of levy effective from July 1, 1994, have been US\$0.51 (AUS\$0.741) for lambs and US\$0.22 (AUS\$0.321) for sheep; export charges effective from July 1, 1994, have been US\$0.18 (AUS\$0.262) for both live sheep and lambs. Transaction levies for cattle, and beef production levies for the fiscal year ending June 30, 1994, were US\$46.4 million (AUS\$67.1 million), down from US\$50.3 million (AUS\$71.6 million) in the previous year. The AMLC also received export market grants from the Australian Government of US\$175,750 (AUS\$250,000) in fiscal year 1993 and US\$172,950 in fiscal year 1994. The grants are part of general operating revenue and represent revenues for various farm sectors.⁹⁵

Wool International⁹⁶

Wool International (WI) is an Australian statutory authority that officially came into existence on December 1, 1993, under provisions of the Wool International Act, 1993 (WI Act, 1993).⁹⁷ WI replaced the Australian Wool Realization Commission. WI has five major tasks: to sell Australia's wool stockpile (3.67 million bales as of June 30, 1994) consistent with a

⁹³ Data on expenses and revenues of the AMLC in this section were taken from the AMLC 1993-1994 Annual Report, financial statement, pp. 55-64, except as noted.

⁹⁴ Exports of Australian beef to the United States were valued at \$694.3 million in 1994, whereas comparable exports of Australian lamb and mutton were valued at \$34.6 million. See AMLC, *Statistical Review*, July 93-June 94, p. 24.

⁹⁵ Trendl, counsel for AMLC, conversation with USITC staff, May 2, 1995.

⁹⁶ The information in this section on Wool International is principally from "Wool International," *Annual Report 1993-1994*, Nov. 25, 1994.

⁹⁷ WI is directly responsible to the Minister for Primary Industry and Energy.

fixed quantity rule from July 1, 1994, onward; to effectively manage nonwool assets; to develop efficient liquid forward markets for wool; to provide services to the Australian wool industry; and to prepare for privatization, enabling ownership of residual assets to formally pass to woolgrowers.⁹⁸

WI programs

Under the WI Act, 1993, WI is required to sell from its wool stockpile at least 28,000 bales per month for the 6 months between July and December 1994 and 187,000 bales per quarter from January 1995 until privatization. During FY 1993-94, WI sold 286,000 bales. WI has authority to buy wool to maintain its net position in relation to the fixed quantity sales schedule. However, this authority to buy wool is narrowly defined. The WI Act, 1993 indicates that WI is not to be a trader in the day-to-day operations of the market. Rather, any buying activity is to be used on specific occasions, where needed to ensure that WI meets the legislated disposal schedule.⁹⁹

To develop efficient liquid forward markets for wool, WI has established a forward sales program as the main method of selling the stockpile. WI has also conducted auction sales for both spot and deferred delivery and entered into private tenders for deferred and spot delivery. WI has also worked with the Sidney Futures Exchange to establish a future exchange for wool. As part of its responsibility to provide services to the Australian wool industry, WI conducts market reporting services previously handled by the Australian Wool Corporation.

Under current law, the privatization of WI is to occur no sooner than July 1, 1997, provided there is sufficient net worth. Growers initially are to receive shares in proportion to wool tax paid over the 4 years, from 1993-94 to 1996-97, in conformity with privatization directions of the WI Act, 1993.

WI revenues and wool tax¹⁰⁰

WI's first Annual Report indicated that its operating revenues, before abnormal items, were derived primarily by a wool tax (generally, 4.5 percent on the value of shorn wool on which shorn wool tax was paid) and sales of wool from the WI stockpile. Additionally, in 1993 the Australian Government contributed US\$15.8 million (AUS\$22.5 million). For 1993, the wool tax amounted to US\$138 million (AUS\$197 million) and accounted for 57 percent of the total operating revenues of US\$245 million (AUS\$348 million), while sales of wool from the WI stockpile amounted to US\$49 million (AUS\$70 million) and accounted for 20 percent. The aforementioned government contribution

⁹⁸ WI, *Annual Report 1993-1994*, p. 16.

⁹⁹ The information in this paragraph is from WI, *Annual Report 1993-1994*, p. 16.

¹⁰⁰ Data on WI Revenues and Wool Tax were taken from the Annual Report Financial Statements, Nov. 25, 1994, pp. 49-69.

accounted for 6 percent. For 1994, the wool tax amounted to US\$79 million (AUS\$114 million) and accounted for 34 percent of the total operating revenues before abnormal items of US\$233 million (AUS\$337 million), while sales of wool amounted to US\$111 million (AUS\$161 million) and accounted for 48 percent; there was no government contribution. In both 1993 and 1994, property rentals and interest accounted for most of the remaining operating revenues.

Australian Wool Realization Commission

The Australian Wool Realization Commission (AWRC) was established under the provisions of the Australian Wool Realization Commission Act, 1991. On its establishment in 1992, the AWRC took over the US\$2.1 billion (AUS\$2.7 billion) debt and 4.6 million bales wool stockpile of the Australian Wool Corporation.¹⁰¹ A program associated with the AWRC, the Wool Industry Supplementary Payment Scheme (WISPS), was established by the Australian Federal Government in March 1991. The announced purpose of the program was to compensate woolgrowers for the difference between the market price after the abolition of the Reserve Price Scheme¹⁰² and that during February-June, 1991, when the Reserve Price for wool was still in effect. Total payments over the life of the WISPS were AUS\$311 million (consisting of AUS\$300 million of Australian Federal Government funds and AUS\$11 million of AWRC funds). This program was terminated in 1992.¹⁰³

The Australian Wool Corporation¹⁰⁴

The Australian Wool Corporation (AWC), a statutory authority, has the objective to improve the performance of the wool industry in Australia and promote wool and wool products within and outside Australia by facilitating efficient marketing and improving the quality of Australian wool. As noted earlier, the AWC's function in the marketing of wool was taken over by the AWRC. During 1992 and 1993, the AWC's International Market Development group expanded its activities in Asia, the Commonwealth of Independent States (CIS), and Egypt. The AWC was reported to have received Australian Federal Government grants of US\$18 million (AUS\$25 million) in 1992-93.¹⁰⁵

¹⁰¹ AWRC, *Annual Report 1991-1992*, Dec. 1, 1992, p. 1.

¹⁰² As reported in the *Australian Wool Corporation Annual Report 1987-1988*, page 24, the AWC operated the Reserve Price Scheme (RPS) to provide price stability for Australian wool. Under the RPS the AWC bought and held wool offered at auction that failed to attract a trade bid equal to or above the reserve price established by the AWC. The RPS was reported to be financed entirely by woolgrowers through the Market Support Fund of a wool tax levy.

¹⁰³ AWRC, *Annual Report 1991-1992*, p. 12.

¹⁰⁴ The information in this section on the AWC is principally from USDA, FAS "Agricultural Situation, Competitor Market Promotion Activities - Australia," (AGR No. AS4009), Feb. 9, 1994, p. 5.

¹⁰⁵ USDA, FAS, "Agricultural Situation, Government Expenditure on Agricultural Promotion," (AGR No. AS4021), May 3, 1994, p. 1.

Australian State and Territory Programs

State governments provide certain outlays relating to livestock production, although data on specific state programs are not available. Such funds are primarily for research, extension service, inspection, disease and pest control, and soil conservation. Table 3-19 shows estimated total State government budgetary outlays for Australian sheepmeat production by State and Territory, for FY91.¹⁰⁶

According to Mr. Michael J. Taylor, Secretary for Agriculture, Department of Agriculture Victoria, the Australian Government has reduced regulation over the last 20 years and placed greater emphasis on private industry. The State of Victoria does not maintain separate statistics on the lamb industry and relies on that collected by ABARE in Canberra. The Victorian Department of Agriculture provides support to the sheep and wool industry in the form of research from funds it receives from the AMLC.¹⁰⁷

CHAPTER 4: NEW ZEALAND INDUSTRY

Structure and Operations of the New Zealand Industry

Sheep are raised throughout New Zealand, and producers benefit from nearly ideal climatic and grazing conditions. Many of New Zealand's sheep are dual-purpose breeds, producing both wool and meat. The most common breed is the Romney, a breed not commonly raised in the United States. Other important breeds include the Coopworth, Perendale, Corriedale, and Merino.¹

Sheep Inventory

The sheep inventory in New Zealand declined steadily from 58 million animals in 1990² to 50 million animals in 1994 (table 4-1), continuing a long-term decline from 70 million in 1982. The decline in sheep numbers reflects in part lower wool prices and the continued movement, especially in northern regions, away from sheep raising and toward dairying and beef cattle production.³ During the past decade, approximately 2.0 million acres of pastoral lands were converted to forestry and horticulture, and an additional 1.2 million acres is projected to be converted this decade.⁴ New Zealand comprises chiefly the North Island and South Island (see figure 4-1). In the North Island, approximately 44,478 acres were converted from grazing lands to forestry in 1994.⁵

The decline in sheep inventory occurred in both the North Island and the South Island. However, the greatest decline occurred in the North Island as shown in the following tabulation (1,000 animals):⁶

<u>Region</u>	<u>1990</u>	<u>1991</u>	<u>1992</u>	<u>1993</u>	<u>1994¹</u>

Figure 4-1
Location of principal lamb producing areas in New Zealand, 1995

Source: Adapted from New Zealand Meat Producers Board.

The North Island accounted for 46 percent of the total sheep inventory in 1994, down 2 percent from 1990, and the South Island accounted for 54 percent, up 2 percent from 1990. During 1990-94, the sheep inventory in the North Island fell by 18 percent, while the inventory of sheep in the South Island fell by 9 percent. Principal sheep-raising regions in the South Island include Otago-Southland and Canterbury-Westland, representing 29 and 25 percent, respectively, of the total sheep inventory (figure 4-1). Principal sheep raising regions of the North Island include East Coast, North-South Auckland, and Taranaki-Wanganui-Manawatu, accounting for 21, 15, and 10 percent, respectively, of sheep inventory as of June 30, 1994.

Growing Operations

Sheep in New Zealand generally require no shelter and little or no supplemental feed (grain) as grazing in most of New Zealand is available throughout the year. The New Zealand Meat & Wool Board's Economic Service (NZEC) estimates that, in 1993, there were 19,600 New Zealand farms with about 50 million sheep.⁷ Specific farm characteristics (acreage, animal-carrying capacity, primary sheep type, and so forth) vary significantly and are mostly dependent upon the climate, soil fertilities, and topography.

Sheep farming in New Zealand can be divided into three regions: the lowland, the hill country, and the high country. The lowland region is generally located on flat or rolling country and is capable of being plowed. This region includes Southland on the South Island, which is the most intensive sheep belt in New Zealand. Farmers in this area generally employ a controlled grazing system, in which the grazing areas are constantly rotated.⁸ The NZEC estimates that an average South Island intensive finishing farm would be about 500 acres with 2,400 sheep and 15 cattle, and the operation would be capable of carrying about 5 to 6 sheep or stock units per acre (one stock unit is equivalent to one ewe).⁹

The hill country is mostly in the North Island and has been developed out of bush or forest. The NZEC estimates that, in 1993, there were 7,250 hill country farms with an average farm estimated to be about 2,300 acres with 3,600 sheep and 300 cattle. North Island hill country farms averaged about four stock units per acre, whereas South Island hill farms averaged about one and one-fourth. In general, the North Island's climate is milder and wetter than the South Island's.

High country sheep farms are located in the South Island. This land is generally described as unproductive steep mountain land that is erosion prone,

⁷ NZEC, *The New Zealand Sheep and Beef Farm Survey 1992-93*, publication No. 2075, Feb. 1995, p. 10.

⁸ Sheep producers Alistar Crossen of Balcutha, NZ, and Neil and Mary Ann Winters, Invercargill, NZ, interviewed by USITC staff, Mar. 30, 1995.

⁹ One ewe = 1 stock unit; one hogget or wether = 0.7 stock units; one cow = 5.5 stock units; one mature stag (male deer) = 2.1 stock units.

dry, and located from 3,000 to 6,000 feet above sea level.¹⁰ The majority of land classified as high country (6.2 million acres) is owned by the New Zealand Government (Crown lands) and is commonly leased, with use restrictions, generally by farmers who have adjoining properties.¹¹ The NZEC estimates the number of high country farms at 250, with 2.5 million sheep (nearly all Merinos). The average high country sheep operation is about 25,000 acres, with about 9,000 sheep, 300 cattle, and 60 deer and is on average capable of supporting about one sheep per three to four acres.¹²

There is little foreign ownership of sheep farms in New Zealand, and the Overseas Investment Commission (OIC) must approve all investments in rural land. During 1991-94, the OIC approved foreign purchases of sheep farms totaling 54,000 hectares (133,434 acres), or less than 1 percent of all sheep farming land. However, the OIC does not collect information on the share of these lands that were actually purchased by foreign interests.¹³

Meat Packing and Processing Sector

Farmer-owned cooperatives own most of the New Zealand sheep/lamb meat processing industry.¹⁴ There is currently no foreign ownership in New Zealand's processing plants. Among the largest lamb meat processors are Affco New Zealand Ltd. (Affco), Alliance Freezing Company, Ltd, Primary Producers Cooperative Ltd (PPCS), Lowe Walker, and Richmond. Lowe Walker is the only major privately owned firm.¹⁵ Since 1992, one new lamb slaughtering plant has begun production (AFFCO Northland) and it is estimated there were about

¹⁴ The New Zealand Commerce Commission is a government agency established under the Commerce Act of 1986. The Commission, among other things, conducted a study of the New Zealand sheep and lamb sector and released a report, Commerce Commission Decision No. 273 (ISSN No. 0114-2720), Feb. 2, 1995. The New Zealand Commerce Commission defines the meat-processing industry as "those companies that undertake the slaughter of livestock, cutting the carcasses into desired forms, packing, and freezing or chilling the products." Further processing of meat into cuts to meet the specifications of particular purchasers is sometimes undertaken by separate companies. Commission report, p. 13.

¹⁵ Theodore Horoschak, Agricultural attache, Embassy of the United States, interviewed by USITC staff, Wellington, New Zealand, Mar. 27, 1995.

33 lamb-slaughtering plants (eligible to produce for export) in early 1995.¹⁶ During 1994, two large meat-processing companies went into receivership. Fortex, a major lamb and deer processor, closed two lamb-processing plants located in the South Island (Mosgiel and Ashburton), leaving a debt to farmers of NZ\$10.5 million (US\$6.3 million) for livestock delivered.¹⁷ The plant in Mosgiel was purchased by PPCS and does not slaughter lambs, but undertakes further processing.¹⁸ The Ashburton plant was purchased by Canterbury Meat Packers Ltd. and presently slaughters and processes sheep, lambs, and beef.¹⁹ Excess production capacity has been a major problem affecting the New Zealand meat-processing sector for several years.

In August 1994, Weddel,²⁰ a major sheep and cattle processor, closed six plants (four of which processed sheepmeat) in the North Island owing farmers NZ\$35.0 million (US\$21 million) for livestock delivered.²¹ A consortium of North Island meat-processing companies²² formed Trial Run Holdings Limited that ultimately purchased and permanently closed the slaughter facilities previously operated by Weddel in an effort to reduce processing capacity.²³ High exit costs, usually in the form of redundancy payments²⁴ and clean-up cost can result in inefficient plants remaining open or being purchased by other meat processors.²⁵ There are few choices for meat packing plants; thus, had the consortium not purchased and closed the Weddel plants, the plants would most likely have re-opened under new ownership.²⁶ The permanent closure of the Weddel plants does not prevent new entrants into the processing sector, and existing processors can expand capacity if required to meet slaughter requirements. Quota allocations are required for New Zealand's sheep meat exports to the European Union (EU). With the subsequent closure of Weddel plants, their quota allocation (10 percent of the total quota for sheepmeat during 1995) was transferred to the purchaser of the plants.²⁷

Members of the consortium accounted for over 70 percent of the meat processing in the North Island during 1993-94 (beef, sheep, and lamb), and

¹⁶ New Zealand Meat Producers Board officials, interviewed by USITC staff, Wellington, New Zealand, Apr. 1995.

²⁷ Ibid., p. 46.

Weddel accounted for most of the remainder.²⁸ The purchase was investigated for anticompetitive behavior by the New Zealand Commerce Commission (Commerce Commission) under the Commerce Act. The Commerce Commission approved the transaction as acceptable under the Act and ruled that sufficient competition remains in the industry to ensure competitive demand for slaughter animals at the farm gate.²⁹ In addition, the Commerce Commission concluded that the benefit to the public from the proposal would significantly outweigh the detriments from the loss of competition.³⁰ The decision is being appealed.³¹

The Commerce Commission reported excess current capacity³² at 6 percent for sheep-processing plants in the North Island (before the closing of Weddel). Since the closure of the Weddel plants, North Island processors have been able to expand physical capacity to accommodate increased livestock supplies caused by drought on the East Coast. Some plants have increased capacity by working a second shift and by converting to the inverted chain processing system.³³ Some producers have experienced delays in slaughtering services during peak slaughtering periods; however, considerable excess capacity still exists during nonpeak slaughter periods when supplies of sheep are low.

Some New Zealand plants are large-volume operations. For example, the Alliance Lorneville plant, located in the South Island, is the world's largest sheep-processing plant.³⁴ This plant slaughters approximately 22,000 sheep daily and operates about 7 months a year. The plant operates six chains, all using the inverted chain processing system. In addition, to the advantages stated above, Alliance officials stated that fewer workers are required with the inverted chain system. The plant employs approximately 1,400 workers (of which 350 work the kill floor). Approximately 2.6 million lambs will be processed in 1995. Most of the meat is further processed (for example, trimmed, deboned, or prepared into chef or retail ready cuts), placed in air-tight plastic packages, boxed, and shipped. Only about 20 percent of the lamb processed is shipped in carcass form.

Major markets for Alliance's lamb meat include Europe and Japan. In recent years, Alliance officials reported that these markets have demanded a greater share of further processed products. The plant also custom slaughters for the domestic supermarket chains.

Lamb Meat Production, Consumption, and Prices

Production

The number of lambs slaughtered increased from 25 million animals in 1990 (year ending September 30) to 28 million animals in 1992, then declined to 23 million in 1993 (table 4-1). Such production rose to 26 million animals in 1994. The increase in lamb slaughter during 1994 reflected an increase in the number of lambs born in the preceding spring and a high rate of lamb survival owing to good weather around most of New Zealand. The decline in slaughter in 1993 reflects both a continuing rundown of the sheep flock and fewer lambs available for slaughter because of unfavorable weather during the winter of 1992, which resulted in significant losses of livestock numbers.³⁵

New Zealand's production of live lambs (lamb crop), as measured by the number of lambs tailed (docked), declined from 41 million animals in 1990 (year ending June 30) to 35 million animals in 1992, and then rose to 38 million in 1994 (table 4-1). The overall decline in lamb production reflects, in large part, the decline in total sheep numbers and the number of ewes kept for breeding purposes.

The number of ewes kept for breeding purpose declined by 13 percent during the period from 40 million animals at yearend June 30, 1990, to 35 million animals at yearend June 30, 1994 (table 4-1). The lambing rate (lambs tailed as a percentage of ewes mated in the previous autumn) is also shown in table 4-1.

New Zealand lamb meat production increased from 772 million pounds (carcass-weight basis) in 1990 (year ending September 30) to 882 million pounds in 1992 (table 4-2), reflecting an increase in the number of lambs slaughtered as well as an increase in average carcass weights. Such production declined in 1993 to 783 million pounds, then rose to 849 million pounds in 1994. The average export carcass weight increased steadily during 1990-94 from 13.71 kilograms (30 pounds) to 15.00 kilograms (33 pounds).

During 1990-94, sheepmeat (mutton and lamb) production accounted for between 44 and 51 percent of New Zealand's meat production as shown in table 4-3. Lamb accounted for 33 percent, and mutton for 13 percent in 1994.

Consumption

Lamb meat consumption in New Zealand during 1993 is shown in the following tabulation:

<u>Meat type</u>	<u>Annual meat consumption</u> (Million pounds)	<u>Share of total consumption</u> -- (Percent) ---	<u>Per capita meat consumption</u> --- (Pounds) ----
Beef	231	34	67
Veal	2	(1)	(1)
Mutton	122	18	35
Lamb	65	9	19
Pigmeats	112	16	33
Poultry	<u>158</u>	<u>23</u>	<u>46</u>
Total	689	100	200

¹ Negligible.

Source: Compiled from official statistics of the NZEC, *Annual Review of the New Zealand Sheep and Beef Industry, 1993-94*, p. 25.

Lamb meat accounted for about 9 percent of total meat consumption. Per capita consumption of lamb meat in New Zealand declined steadily from 28 pounds in 1991 to 19 pounds in 1993, or by 32 percent.³⁶ The decline in consumption reflects competition from lower priced white meats.³⁷ As noted earlier, lamb meat production declined in 1993.

Prices

Relatively few lambs are sold on a live basis; therefore, price statistics of lambs on a live basis are not collected or reported.³⁸ Prices New Zealand farmers receive for their lambs are determined after the lambs are slaughtered by carcass weight and yield for the slaughtered animals. The price of lamb carcasses in New Zealand is significantly less than prices received by U.S. farmers for slaughter lambs. This primarily reflects the smaller carcass size derived from New Zealand lambs.

During 1990-93, the annual average price for New Zealand lamb carcasses³⁹ generally increased from a low of \$42.92 per hundred-weight (cwt) in 1991 to a high of \$61.08 in 1993. During the first 6 months of 1994, the average price was \$60.83 per cwt. Table 4-4 shows monthly lamb carcass prices

paid to New Zealand farmers for January 1990 through June 1994. Changes in monthly lamb carcass prices generally reflect prices for New Zealand lamb sold on the London wholesale market and foreign exchange rates.⁴⁰ In addition, increases in prices could reflect limited supplies resulting in the meatpackers' bidding up lamb prices to maintain slaughter levels. Quarterly average retail prices for lamb/hogget⁴¹ chops and shanks in New Zealand are shown in table 4-5.

Table 4-6 shows monthly London wholesale prices for New Zealand lamb carcasses for January 1990 through June 1994. These prices fell from a peak of US\$119.72 per cwt in August 1990 to \$88.99 per cwt in August 1991 and generally reflected substantial declines in prices of competing meats, primarily British domestic sheep meat and pigmeat.⁴² During August 1991 through January 1994, New Zealand lamb carcass prices generally increased in the United Kingdom (to US\$129.66 per cwt), reflecting a general shortage of sheepmeat in that market and voluntary restraint agreement (VRA) limitations on the quantity of imports.⁴³ Subsequently, New Zealand lamb carcass prices declined to US\$116.54 per cwt in June 1994.

Production Costs and Profitability

Live lamb sector

Nearly all New Zealand sheep producers raise cattle. Consequently, separate financial data are not available for sheep operations. Table 4-7 shows average revenue (cash) and expenditures (cash) for New Zealand sheep and beef farms for 1991-92 through 1994-95.⁴⁴ Total expenditures per farm increased from US\$57,747 (NZ\$104,012) in 1991-92 to US\$62,776 (NZ\$111,900) in 1993-94. Expenditures are projected to total US\$68,554 (NZ\$112,200) in 1994-95. Major cost components included fertilizer, lime, and seeds, repair and maintenance, and interest. Expenditures for fertilizer and repair and maintenance increased steadily from 1991-92 through 1993-94, accounting for 15 and 8 percent, respectively, of total farm expenditures in the latter year. Fertilizer expenditures are projected to decline in 1994-95. Significant declines in gross farm income during the late 1980s resulted in the decline of fertilizer applications on many farms as a way to reduce expenditures.⁴⁵ However, with an increase in farm incomes in the early 1990s, fertilizer sales increased. Repairs and maintenance rose from US\$4,341 (NZ\$7,818) per farm in 1991-92 to US\$5,377 (NZ\$8,800) in 1994-95. Some New Zealand farmers report

that, in the short run, the use of fertilizer and expenditures on repair and maintenance may be reduced to lower production costs, but such expenditures are required in the long-run in order to sustain farm productivity.⁴⁶

¹ Projected.

Source: Compiled from statistics of the NZEC, Service Paper, No. G2076, Mar. 2, 1995.

During 1991-92 through 1993-94, interest costs⁴⁷ declined by 21 percent, reflecting lower interest rates and debt levels.⁴⁸ Many farmers are using interest savings to reduce debt levels.⁴⁹ The drop in interest rates during 1993 was estimated to have saved the average sheep and beef farm US\$1,115 (NZ\$2,100) in interest payments over a full year.⁵⁰

Expenditures for wages, shearing, depreciation, animal health, fuel, electricity, and other input costs are included in the "Other Expenditures"

⁴⁷ Interest expenditure consists of actual payments of interest on mortgages, bank overdrafts and on debit balances of stock firm current accounts. It does not include any allowances for interest on the farmer's own equity. See NZEC, *The New Zealand Sheep and Beef Farm Survey 1992-93*, Feb. 1995, p.40.

⁴⁸ NZEC, *Annual Review of the New Zealand Sheep and Beef Industry*, 1993-94, p. 13.

⁴⁹ Ibid.

⁵⁰ SONZA, 1994, p. 15.

category.⁵¹ Collectively, such other expenditures accounted for about 63 percent of total farm expenditures during the period.

Gross farm revenue for the average sheep and beef farm rose steadily from US\$74,995 (NZ\$135,077) in 1991-92 to US\$92,444 (NZ\$151,300) in 1994-95 (table 4-7 and figure 4-2).⁵² Sheep (lamb and mutton) sales accounted for 35 percent of farm revenues in 1994-95, down from 40 percent in 1993-94. Revenue from sales of wool accounted for 29 percent of total revenue in 1994-95, up 22 percent from the previous year. Other major sources of revenue include sales of cattle and crops.

Average farm profit before tax rose steadily from US\$17,247 (NZ\$31,065) in 1991-92 to US\$23,890 (NZ\$39,100) in 1994-95, or by 39 percent. During the early to mid 1980s the New Zealand meat-processing industry experienced many work stoppages.⁵³ The Labour Relations Act 1987 led to the restructuring of the meat-processing industry and helped improved efficiency in the processing sector. This Act simplified the registration of unions and defined lawful and unlawful strikes and lockouts. It also stated that "the slaughtering of meat for the domestic or export market" was defined as a Part B essential service for which notice of an intent to strike of no less than 3 days was required.⁵⁴

In addition, the Employment Contracts Act 1991 (ECA) made major changes to the basis of employment in all occupations. Compulsory union membership was abolished, and unions were no longer officially registered as one of the negotiating parties to an enterprise agreement.⁵⁵ According to the Commerce Commission, the ECA has been a major factor in reducing NZ processing costs.⁵⁶

A significant improvement in lamb and sheep processing has been the development of the "inverted chain." Traditionally, lambs and sheep were hung by their rear feet and the skin was pulled down over the head. Under the inverted chain process, lambs and sheep are hung by all four legs and the skin is removed from the head down. Advantages of the inverted chain process include faster processing and improved hygiene. The cost to convert to the inverted chain system was estimated to be between NZ\$500,000 to \$600,000 per chain (US\$296,600 to US\$356,000 in 1994). Most packers in New Zealand have converted to the inverted chain system.

Meat packing and processing sector

New Zealand meat processors as a whole reportedly experienced substantial losses in 1991, 1993, and 1994.⁵⁷ In addition, the New Zealand Commerce Commission, as part of Decision No. 273, reviewed the annual accounts of several North Island meat processors and, in February 1995, concluded that "the financial performance of the industry has been markedly unsatisfactory in recent years."⁵⁸ Another report suggested that "aggregate economic value added by the industry was negative in each of the five years from 1989 to 1993 and that economic value totalling NZ\$750 million was lost in that time."⁵⁹ Southpac Corporation Limited estimated that a further loss of US\$98 million (NZ\$165 million) would occur in 1994.

The major costs incurred by the New Zealand meat packing and processing sector include the cost of livestock and labor. According to the Commerce Commission, competition for livestock among the four multiplant processors (AFFCO, Weddel, Richmond, and Lowe Walker), who accounted for 68 percent of the sheep kill in the North Island, caused them to pay more for livestock than was justified by the returns for product in export markets. Processors sought to maximize output in order to reduce average costs as well as to secure entitlements to quota.⁶⁰

Wool Production

New Zealand is the world's fourth largest wool producer, accounting for 13 percent of production in marketing year⁶¹ 1994. Such production declined steadily from 1990 to 1993, then rose to 472 million pounds in 1994 (table 3-11). The estimated value⁶² of such production amounted to US\$508 million (NZ\$906 million).⁶³ The decline in production during 1990 through 1993 reflects the decline in total sheep numbers and, in 1993, the high death rates of wool-type sheep and the low per-head wool production because of unfavorable weather. Wool production increased by 11 percent in 1994 compared with 1993 as favorable wool growing conditions resulted in higher shorn wool weights offsetting any further decline in sheep numbers.⁶⁴

⁶⁴ Ibid.

Exports

Lamb Meat

The bulk of New Zealand's lamb meat production is exported. Table 4-2 shows New Zealand's lamb meat exports (carcass-weight basis) for 1990-94. Exports increased from 732 million pounds in 1990 (95 percent of production) to 838 million pounds (95 percent) in 1992, then dropped to 747 million pounds (95 percent) in 1993 and rose to 827 million pounds in 1994 (97 percent). Changes in the quantity exported generally reflected the number of lambs slaughtered and the average export carcass weight. The increase in the quantity of exports in 1994 generally reflects an increase in the number of lambs slaughtered in that year.

In recent years, the share of New Zealand lamb meat exported in the form of carcasses has decreased, but the share exported in the form of cuts and boneless product has increased. Table 4-8 shows New Zealand's export by type for 1990-94. During this period, exports of lamb cuts generally increased from 52 percent to 63 percent of total lamb meat exports (shipping-weight basis), while exports of lamb carcasses fell from 48 percent to 36 percent. Boneless lamb exports increased from 2 million pounds in 1990 to 6 million pounds in 1993, then fell slightly to 5 million pounds in 1994.

Table 4-8

Source: Compiled from official statistics of the New Zealand Meat Producers Board Annual Report, various issues.

New Zealand's lamb meat exports on a product-weight basis peaked at 739 million pounds in 1992, then fell to 592 million pounds in 1993 (table 4-9). Such exports rose to 604 million pounds in 1994. The European Union (EU) is the largest market for New Zealand lamb meat exports and accounted for 52 percent, by quantity, in 1994. Other major markets include the Middle East, Pacific,⁶⁵ North America, and Asia.

The United Kingdom is the largest single market, accounting for 25 percent of total lamb meat exports by quantity in 1994. Other significant EU markets were Germany, accounting for 7 percent, and France and Greece, each accounting for 5 percent. Exports of sheepmeat (mutton and lamb) to the EU are subject to quantitative restrictions under various voluntary restraint agreements (VRAs). The 1994 sheepmeat VRA for New Zealand was 205,600 metric tons (453 million pounds) with no levy. Within this VRA, there was an allowance for 13,500 tons (29.7 million pounds) of high-value chilled sheepmeat, up from 1,500 tons (3.3 million pounds) in 1993.⁶⁶ The 1995 VRA provides for a New Zealand sheepmeat quota of 225,000 metric tons (496 million pounds), nearly a 10-percent increase. In addition, restrictions on chilled lamb imports are scheduled to be removed by July 1, 1995.⁶⁷

New Zealand's lamb meat exports to the Middle East increased from 87 million pounds in 1990 to 175 million pounds in 1992, fell to 83 million in 1993, and rose to 91 million pounds in 1994 (table 4-9). The rise and subsequent decline in exports to the Middle East largely resulted by changes in the quantity exported to Iran. Such exports rose from 18 million pounds in 1990 to 96 million pounds in 1992, then declined to zero in 1993 and 1994. Trade sources report that Iran dropped out of the market as a result of increased New Zealand lamb prices in 1993 and remained out of the market in 1994.⁶⁸ Saudi Arabia and Jordan have been the largest markets for New Zealand lamb meat in the Middle East since 1993.

New Zealand lamb meat exports to the Pacific region rose from 56 million pounds in 1990 to 90 million pounds in 1994 (table 4-9), accounting for 15 percent in 1994. Papua New Guinea and Fiji were the major markets for the Pacific region, accounting for 54 and 22 percent of such exports in 1994. Such exports consist largely of less expensive cuts,⁶⁹ such as flaps.⁷⁰ Exports to Asia declined from 54 million pounds in 1990 to 36 million pounds in 1994, primarily as a result of the declining exports to Japan (40 million pounds to 22 million pounds).

During 1990-94, exports to North America increased from 33 million pounds to 42 million pounds (table 4-9). During 1990-94, exports to the United States ranged from a low of 10 million pounds in 1991 to a high of

⁶⁵ Primarily, Papua New Guinea and Fiji.

16 million pounds in 1993. Such exports fell slightly to 15 million pounds in 1994. Lamb meat exports to the United States accounted for 2.5 percent (quantity basis) of total New Zealand lamb exports in 1994. Exports to Mexico increased from 4 million pounds to 11 million pounds during 1990-94. Exports to Canada remained fairly constant and averaged 16 million pounds annually during the period.

Promotion and advertising of New Zealand lamb meat in the U.S. market is funded by the NZMPB through the NZ Spring Lamb Co. and by private New Zealand exporters and their U.S. representatives and importers. Foreign promotion/market information expenses for all meat exports by the NZMPB totaled NZ\$5.2 million (US\$3.0 million) in 1994 (year ending September), down from NZ\$8.1 million (US\$4.3 million) in 1993.⁷¹ In recent years, the NZ Spring Lamb Co. spent approximately US\$120,000-180,000 annually promoting NZ lamb in the United States.⁷²

Limited promotional assistance is available through the New Zealand Trade Development Board (TRADE NZ), a New Zealand Government trade promotion agency.⁷³ For FY94 (year ending June), total government funding for direct export promotion was NZ\$6.0 million (US\$3.4 million) up from NZ\$4.7 million (US\$2.5 million) in FY93.⁷⁴ Such funding tends to be targeted to sectors that do not have the backing of producer boards, such as food, beverage, and agribusiness. Funding was used primarily for market analysis, promotion, and consultancy services through special projects with the fishing, venison, wine, tanning, beef, persimmon, calla lily, and forestry industries.⁷⁵

Live Sheep Exports

New Zealand's exports of live sheep (including lambs) fluctuated during 1990-94 as shown in table 4-10. Saudi Arabia was the sole New Zealand export market during 1990-94. In December 1990, a disagreement over animal health standards resulted in a temporary stoppage of live lamb exports to Saudi Arabia; exports to this market resumed in March 1991. However, in October 1994, New Zealand suspended indefinitely exports of live lambs to Saudi Arabia and to the Gulf States because of "An unacceptably high death rate in transit."⁷⁶

Wool Exports

New Zealand is the second largest exporter of wool, accounting for 27 percent of world exports (by quantity, clean basis) during marketing year⁷⁷ 1994 (table 3-11). The following tabulation shows the value of New Zealand wool exports for marketing years 1990/1994 as estimated by the USITC staff:⁷⁸

<u>Marketing year</u>	<u>Millions of US dollars</u>
1990	636
1991	464
1992	523
1993	397
1994	518

The irregular decline in New Zealand's wool exports during 1990-93 reflects in part declining international wool demand and prices. During this period New Zealand's wool production declined and inventories increased. In marketing year 1994, international wool demand and prices increased, and as a result exports increased significantly.⁷⁹

⁷⁷ July/June marketing year.

⁷⁸ Ibid.

⁷⁹ SONZA, 1994, p. 39.

New Zealand Grading System

The New Zealand grading system is more complex than that used by the United States. It consists of three export carcass classes and four export-processing classes. New Zealand does not have a compulsory domestic grading system for lamb.

The New Zealand Meat Producers Board (NZMPB) has statutory authority to establish classification and quality standards for export meat.⁸⁰ New Zealand meat exports are certified by veterinarians from the New Zealand Ministry of Agriculture and Fisheries (MAF) guaranteeing that the meat complies with the public health and hygiene requirements of the country to which it is sold. All meats and meat products are monitored to ensure that they do not contain residues that exceed internationally agreed levels or the specific residue requirements of an importing country or are harmful to health. Dressed carcasses are classified according to animal type, weight, and fat content (and in some cases muscling), with classification conducted by full time specialist graders employed by each processor. The NZMPB defines lamb as "young sheep under 12 months of age or which do not have any permanent incisor teeth in wear."⁸¹ In addition, all export meat is cut to objectively defined specifications and given a standard packing number to simplify ordering.⁸² New Zealand lamb exports must also meet standards for tenderness.⁸³

New Zealand Government Assistance

Government assistance to New Zealand agriculture has declined significantly since the 1980s. Animal and plant health service, research, and climatic disaster relief are the major areas in which the government provides assistance.⁸⁴ New Zealand Government programs with respect to lamb are well documented since New Zealand was the subject of a countervailing duty order issued September 1985 and revoked in May 1995. The U.S. Department of Commerce (DOC) provided a description of the New Zealand programs they reviewed in conjunction with the CVD order in the Federal Register of March 1, 1995, (60 F.R. 11072). The DOC notice covered the following programs: (1) Livestock Incentive Scheme, (2) Regional Development Suspensory Loan Scheme, (3) Export Assistance Grant Scheme, (4) the Export Market Development Taxation Incentive, (5) Export Suspensory Loan Scheme, and (6) Export Programme Grant Scheme/Export Programme Suspensory Loan Scheme. The descriptions of these programs that follow are those of the DOC and are taken directly from the March 1, 1995, Federal Register notice. In addition, a synopsis of other New Zealand programs and assistance is provided below.

⁸⁰ NZMPB, *New Zealand Meat Guide to Carcass Classification*, July 1992.

⁸¹ Ibid.

⁸² NZMPB, *New Zealand Meat Trade Guide*, 1991.

⁸³ To meet the tenderness standard, all lamb carcasses are subject to (1) accelerated conditioning, which reduces conditioning time from 18 to 24 hours to about 2 hours or to (2) aging, a holding treatment that achieves extra tenderness.

⁸⁴ SONZA, 1993, p. 27.

Programs Reviewed Under the CVD

Livestock Incentive Scheme

As described by the DOC, this program was introduced in 1976 to encourage farmers to increase permanently their number of livestock. Under the scheme a farmer engaged in a stock increase program, for a minimum of one and a maximum of three years, could opt for one of two incentives: (1) An interest-free suspensory loan of NZ\$12 for each additional stock unit carried; or (2) a deduction of NZ\$24 from taxable income for each additional stock unit carried. If the livestock increase was met, farmers who elected to take out loans wrote the loans off as tax-free grants. For farmers electing the tax option, the provisional tax deduction could be applied toward tax liability in any of the 3 years after completion of the development program. Applications to participate in the program were accepted until March 31, 1982. No new loans have been given under this program since 1983, and no tax credits have been authorized since the 1983-84 government fiscal year.

During the 1991-92 New Zealand government fiscal year, the DOC found no outstanding loans that had not been converted to grants and no tax credits that remained to be claimed by lamb producers. This program was found by the DOC to have been countervailable because benefits under this program are available only to farmers with livestock herds, and, as such, are limited to a specific enterprise or industry, or group of enterprises or industries.⁸⁵ The Department of Commerce determined the total subsidy to be 0.0013 percent ad valorem for all firms for the period April 1, 1992, through March 31, 1993.

Regional Development Suspensory Loan Scheme

As described by the DOC, the Regional Development Suspensory Loan Scheme (RDSL) was established to encourage utilization of resources in priority regions of New Zealand. Nonpriority regions did not qualify for regional development assistance. The RDSL program administered by the Development Finance Corp. provided interest-free loans that were later converted to grants if development objectives were met. DOC originally found this program to be countervailable because it provided government-funded financing to specific regions in New Zealand on terms inconsistent with commercial considerations.

The RDSL was terminated on April 21, 1986, by the Government of New Zealand (GONZ) and replaced by the Regional Development Investigation Grants Scheme (RDIGS). In 1988 the name of the program was changed to the Business Development Investigation Grant Scheme (BDIGS). All New Zealand taxpayers from any region are eligible to apply to this program. The criteria for eligible projects under the program are (1) the project must be a lawful activity, and (2) the activity must be new to the region in that its technical

⁸⁵ For DOC's notice of this action, see 50 F.R. 28236, June 25, 1985, and 50 F.R. 37708, Sept. 17, 1985, Final Affirmative Countervailing Duty Determination and Countervailing Duty Order; Lamb Meat From New Zealand.

feasibility and/or commercial viability has yet to be established in the region.

The BDIGS helps applicants in assessing the feasibility of a new activity by providing grants to cover such expenses as accountant fees, Ministry of Agriculture and Fisheries soil studies, pilot plant costs, marketing consultant fees, and travel costs of visiting a similar operation in another country. These grants may cover up to 50 percent of the costs related to the project feasibility studies. The DOC verified that, as of June 1989, there are no regional distinctions made by this program or by the government with respect to eligibility for these grants.

The DOC examined the use of BDIGS and found that no producers or exporters of lamb meat used the program at any time between early 1991 to June 1994. The BDIGS is available to all sectors of the economy and all regions within New Zealand; thus, the DOC found that it is not countervailable.

Expert Assistance Grant Scheme

As described by the DOC, the Expert Assistance Grant Scheme (EAGS) was established in 1992 by the Ministry of Commerce (MOC) to assist small businesses (10 employees or less) in their efforts to become more competitive. Under the program, grants are provided to small firms in any industry throughout New Zealand. Grants are provided to firms that are hiring "experts" to help improve quality and provide expertise that is not available within the firm.

The DOC examined the EAGS program and found that no producers or exporters of lamb meat used the program at any time between early 1991 to June 1994. DOC found the EAGS program to be available to all sectors of the economy and all regions within New Zealand. Because this program is not limited to a specific enterprise or industry, or group of enterprises, or to companies in specific regions, the DOC found that it is not countervailable.⁸⁶

The Export Market Development Taxation Incentive

As described by the DOC, the Export Market Development Taxation Incentive (EMDTI) was established in the 1979 Amendment to the Income Tax Act of 1976; exporters have received tax credits for a certain percentage of their export market development expenditures. Qualifying expenditures included those incurred principally for seeking and developing new markets, retaining existing markets, and obtaining market information. An exporter who took advantage of this tax credit could not deduct the qualifying expenditures as ordinary business expenses in calculating taxable income. Because this

⁸⁶ 60 F.R. 11072 and 11074, Lamb Meat From New Zealand; Preliminary Results of Countervailing Duty Administrative Review and Intent to Revoke the Countervailing Duty Order, Mar. 1, 1995.

program was contingent upon exportation, the DOC previously found this program to confer a countervailable grant or subsidy.⁸⁷

Effective with the government fiscal year beginning April 1, 1990, the GONZ eliminated the EMDTI tax credit, and all formerly eligible expenditures are subject to the rules for ordinary business expenses in calculating taxable income. Because certain corporate fiscal years do not correspond with the GONZ's fiscal year, some residual benefits were still possible. However, the DOC reports that no lamb meat exporter claimed benefits under this program on their tax return during the DOC's review period April 1, 1992 through March 31, 1993. The DOC saw no evidence that EMDTI tax credits were given or that they existed during the review period. Accordingly, the DOC determined that this program has been terminated and that there are no residual benefits to lamb meat producers or exporters.⁸⁸

Export Suspensory Loan Scheme

As described by the DOC, Export Suspensory Loan Scheme (ESLS), administered by the Department of Trade & Industry and the Development Finance Corporation (DFC), was established in the 1973 budget and modified by Cabinet decision in 1978. The program's purpose is to provide loans to assist exporters in purchasing equipment needed to expand their production of export goods. The loans covered up to 40 percent of eligible expenditures and were converted to grants if predetermined export targets were met. If the export targets were not met, the loans could be partially converted to grants or called in full at the DFC's long-term interest rates. The ESLS was terminated on March 31, 1985, and the DOC verified that no new loans under this program were granted after that date. The DOC had previously found this program to be countervailable because benefits under this program are contingent on export performance and because the program provided loans that (1) could be at rates lower than those available from commercial sources, and (2) could be converted to grants.⁸⁹

The DOC examined this program and found that there were no outstanding ESLS loans during the review period April 1, 1992, through March 31, 1993. The final payments on loans under this program were made during the 1990-91 New Zealand Government fiscal year. In addition, the DOC saw no evidence that ESLS loans were used by lamb meat exporters during the review period. Consequently, the DOC determined that this program has been terminated and that there are no residual benefits to lamb meat producers or exporters.⁹⁰

**Export Programme Grant Scheme/Export Programme
Suspensory Loan Scheme**

As described by the DOC, the Export Programme Grant Scheme/Export Programme Suspensory Loan Scheme (EPGS) program was established in the 1979 Budget to encourage marketing research in targeted foreign markets. The grants, amounting to 64 percent of budgeted expenditures, were available for up to 3 years. In 1982, the grant program was converted to the EPSLS, a suspensory loan program. Loans covering up to 40 percent of eligible expenditures were available to established exporters who increased their net foreign exchanged earnings through the marketing of specific goods or services in a designated foreign market. If a predetermined sales forecast was accomplished, the suspensory loan was converted into a grant; if the forecast was not met, the exporter repaid the loan with interest.

During DOC's administrative review covering the period April 1, 1986, though March 31, 1987, the DOC verified the EPSLS program and found that on May 23, 1985, the GONZ terminated the program. In addition, the GONZ announced that its commitments made under the program prior to that date would be met. DOC cited a 1988 verification report in which it concluded that no lamb meat exporters were using this program at the time it was terminated.⁹¹ Further, the DOC, during the review period April 1, 1992, through March 31, 1993, found no evidence that this program was used by lamb meat exporters. Accordingly, the DOC determined that this program has been terminated and that there are no residual benefits to lamb meat producers or exporters.

Other New Zealand Programs

The New Zealand Ministry of Agriculture and Fisheries (MAF) implements the Government's policies and programs to derive maximum benefit to the nation from farming, horticulture, and fishing.⁹² MAF advises government on policy and provides advisory and other services to agricultural industries. MAF's quality management system provides quarantine services and related animal health services. In addition, meat inspection service is provided to the meat, game, farmed deer, and export fish industries to ensure that quality standards and overseas market requirements are met.

The management and organization of New Zealand's Government-funded research have undergone major reform in recent years. Agricultural research previously conducted by scientists employed by government agencies, including the MAF Technology and the Department of Scientific and Industrial Research, is now the responsibility of the ten new so called Crown Research Institutes (CRIs).⁹³

⁹¹ 54 F.R. 1950, May 8, 1989, Lamb Meat From New Zealand; Final Results of CVD Administrative Review.

⁹² *New Zealand Official Yearbook*, 1988-89, Wellington, New Zealand, Oct. 1988, pp. 78 & 57.

⁹³ *SONZA*, various issues.

The overall structural organization of the science system (research and development) is now divided into three areas: policy, funding, and science operations. Policy advice is provided by the Ministry of Research, Science and Technology (MRST), and funds for research and development and scientific services are allocated by the Foundation for Research, Science and Technology (FRST).⁹⁴ The CRIs are funded by the FRST and compete with other researchers for public funding.⁹⁵ The most important component of the new system is the Public Good Science Fund (PGSF).

Public Good Science Fund

Administered by the MRST, the PGSF is the single largest source of public research funding in New Zealand.⁹⁶ Created in 1990, the PGSF is the primary means by which the Government invests in science on behalf of New Zealand citizens. Approximately 60 percent of New Zealand's Government total research expenditures moves through the PGSF.⁹⁷ In October 1992, the MRST issued a "Statement of Science Priorities" for the PGSF setting out a series of strategic goals, including funding allocations by designated science areas.⁹⁸ The Statement sets out 5-year funding targets for designated science areas; however, funding levels can be modified.⁹⁹

Funding for research in FY 1991-92 amounted to US\$129 million¹⁰⁰ (NZ\$232 million).¹⁰¹ Funding, totaling US\$11.9 million (NZ\$21.1 million), was allocated for the sheep, beef, meat processing, and fibre processing science area for 1992-93; of which about US\$7.5 million (NZ\$13.4 million) was allocated to sheep production.¹⁰² Funding for the 1994-95 year amounted to US\$174 million (NZ\$284 million).

According to MAF, total government research funding is expected to increase over the next several years with dairying, forestry, and fisheries likely to be major beneficiaries. In addition, research funding will be directed toward processing and product development and toward molecular biology technology within the agricultural sector, whereas funding for operational research will be cut. The cut in operational research includes: "research into sustainability of agricultural systems; animal welfare; control

of pests such as weeds; rabbits and possums; or, policies to protect market access."¹⁰³

Technology for Business Growth Scheme

The Technology for Business Growth Scheme (TBG), which provides funds for research, is administered by the FRST. The goals of the TBG are to "permit New Zealand industry to benefit directly from the results of Government funded R and D."¹⁰⁴ Foreign-owned firms may participate in the TBG as long as they can demonstrate that the "benefits" of New Zealand Government-funded research will be "captured" in New Zealand.¹⁰⁵ Approximately 10 percent of the companies participating in the TBG are foreign-owned and, 1 percent of the total are American owned.

The TBG funding is applicable specifically to the private sector. Firms apply to FRST for funding for research projects. Once a funding proposal has been approved, the firm and a Crown Research Institute (CRI), university, or other government research body jointly perform the research. Any intellectual property rights that are developed are retained by the participating firm. Funding for the TBG has been about NZ\$10.6 million (US\$6.5 million) per year in recent years.¹⁰⁶ Allocations of TBG funds represent assistance to many industries, but data are not available to identify assistance to live lamb and sheep growers or processors of lamb meat.

Public grazing lands

As part of the 1948 Land Act, the New Zealand Government established Crown pastoral leases on about 6.2 million acres of the South Island high country (approximately 20 percent of the South Island).¹⁰⁷ An estimated 1.6 million sheep (primarily Merino), or 3 percent of the total sheep population, are grazed on Crown lands during part of the year. During 1984-93, wool accounted for 68.5 percent of gross revenue of pastoral farms; cattle, for 13 percent; sheep, for 10 percent; lamb, for 5.5 percent; and other livestock, for 3 percent.¹⁰⁸

¹⁰³ SONZA, 1994, p. 21.

¹⁰⁷ "Final Report from the Working Party on Sustainable Land Management," *South Island High Country Review*, Apr. 1994.

¹⁰⁸ *Ibid.*, p. 47.

There are currently 340 South Island farms wholly or partially under pastoral leases, and such leases can be freely traded.¹⁰⁹ The lessee has perpetual right of renewal, exclusive occupation, and the right to graze animals.¹¹⁰ Lease rates are set at 1.5 to 2.25 percent of the land's unimproved value and are reviewed every 11 years.¹¹¹ All improvements on the land, such as fencing and buildings, are owned by the lessee.¹¹² The lessee cannot use the land for any other purpose other than pastoral farming.

The management of the South Island pastoral leases is under review. The New Zealand's Minister of Lands has proposed that some pastoral leases be sold to freehold leases and be made available for other uses, such as eco-tourism and conservation.¹¹³

New Zealand Federal Government Statutory Authority¹¹⁴

New Zealand Meat Producers Board

The New Zealand Meat Producers Board (NZMPB) is a statutory body established under the Meat Export Control Act 1921-22 (Act) that seeks to represent the interests of livestock producers in New Zealand. Recent legislative changes increased the NZMPB's powers and commercial autonomy. The Meat Export Control Amendment Act of 1989 contained major changes to the NZMPB's existing Act and repealed the Meat Export Prices Act 1976.¹¹⁵ Compulsory slaughter levies are collected on all livestock at time of slaughter to finance the NZMPB. The levy rate for lambs and sheep remained unchanged during 1990-94 at NZ\$0.47 (US\$0.28 in 1994) per animal.¹¹⁶ To improve the skills of persons in the meat industry, the NZMPB also provides funding for the Farm Education and Training Association, now registered as the Industry Training Organization for the on-farm sector.¹¹⁷

¹¹⁶ NZMPB, *Annual Report*, 1994, p. 39.

¹¹⁷ Ibid., 1993, p. 15.

The NZMPB attempts to create an environment that ensures the highest returns to the New Zealand producer for meat exported.¹¹⁸ The United States accounted for nearly 55 percent of New Zealand's beef and veal (product weight) exports and about 2.5 percent of lamb meat exports in 1994.¹¹⁹ The NZMPB is responsible for overseeing the marketing of meat for export, including grading and quality standards. The NZMPB issues licenses to meat exporters (many of whom are also processors) who can devote the necessary resources to develop markets overseas. Once approved for a licence, new applicants are required to operate for a probationary period of about 1 year, at which time they may be granted a full licence. As of September 1994, there were 56 full export licenses and 38 probationary licenses.¹²⁰

After receiving recommendations by the Meat Planning Council (MPC),¹²¹ the Meat Board issues special access market licenses for certain markets, but not for the United States. Countries or areas in which special access market licenses are required for sheepmeat as of September 30, 1994, include Iraq, Jordan, Egypt, Syria, Morocco, Tunisia, Algeria, Libya, Canada, Mexico, North Asia, and South Korea. The NZ Lamb Company (North America) Ltd. is the sole licensed exporter of New Zealand sheepmeat to Canada.¹²²

Meat Planning Council

The Meat Planning Council (MPC) was established jointly by the NZMPB and the NZ Meat Industry Association (MIA) in 1991. The MPC is a policy forum composed of members of the NZMPB and meat export companies. The main objective of the MPC "is to take an overview of global marketing, with the aim of ensuring that the commercial activities of individual companies do not run counter to the wider national goal of optimizing international marketplace returns."¹²³ The MPC makes recommendations to the NZMPB on the issue of, and conditions to be attached to, meat export licenses. Commercial cooperation agreements incorporating a system of marketplace franchising have been established with all licensed exporters. Under the franchise system, the right to export to a specific market depends upon conforming to certain conditions, including, when applicable, a performance bond.¹²⁴ Regions subject to performance bonds include North America, the United Kingdom, continental Europe, and the Middle East.¹²⁵

¹¹⁸ Trevor Playford, North American director of the NZMPB, conversation with USITC staff, May 12, 1995. According to Playford, the NZMPB does not purchase or market meat; however, it has statutory authority to do so. This authority is expected to be removed in amendments to upcoming Board legislation by the New Zealand Parliament.

CHAPTER 5: ANALYSIS OF COMPETITIVE FACTORS

Since the Commission's 1990 report on lamb meat, significant government policy and economic events have occurred that have affected the competitiveness of the industry. First, the effect of the termination of the wool incentive payments will be shortly felt, and the full impact is yet unknown. Second, the industry's already fragile infrastructure has been unraveling: three packing plants have closed and the number of growers has dropped significantly. Third, more restrictive measures relating to environmental issues have forced many growers to make decisions about new operating practices. Fourth, imports of lamb meat from Australia and New Zealand have increased and account for an increasing percentage of U.S. consumption. Some U.S. growers view the Australian and New Zealand industries as competitors doing business under fewer constraints and with the advantage of more supportive governments.

This chapter is organized into three major sections. The first section highlights supply factors for the U.S. industry, assessing them relative to Australia and New Zealand. The second section highlights demand-related factors in the U.S. market for U.S., Australian, and New Zealand lamb meat. The third section examines the relationships among lamb meat imports, domestic production, and prices through a data-oriented econometric modelling method called vector autoregression (VAR).

Analysis of Lamb Supply

The following section provides a comparative assessment of factors affecting supply in the U.S., Australian, and New Zealand lamb and lamb meat sectors, which are summarized in table 5-1 along with the nature of government involvement. The United States appears to have a competitive advantage in a number of supply factors, including low-cost concentrates (primarily grains) to growers and, at least in certain areas of the United States, other agriculture alternatives to sheep raising. In addition, the U.S. labor force in the lamb meat packing and processing sector appears to be more efficient than the sectors in Australia and New Zealand, and the U.S. packing sector appears to be more profitable. However, New Zealand appears to have competitive advantages of low-cost grass and hay, favorable climate, and no predators. New Zealand and Australia appear to have the competitive edge with respect to labor in the sheep raising sector and general industry infrastructure.

Industry Size and Infrastructure

The U.S. industry is much smaller, in terms of both live sheep and lamb inventories and lamb meat production, than the industries of Australia and New Zealand as shown in table 5-2. In 1994, there were about 15 sheep and lambs in Australia for each sheep and lamb in the United States and about 6 sheep and lambs in New Zealand for each sheep and lamb in the United States. In terms of lamb meat production, the gap between the United States and Australia and the United States and New Zealand was much narrower. There were about

Table 5-1
Competitive conditions¹ reflecting production and supply in the U.S., Australian, and New Zealand live lamb and lamb meat sectors, 1994

Competitive conditions	United States	Australia	New Zealand
Analysis of lamb supply:

2.8 pounds of lamb meat produced in New Zealand for each pound in the United States and about 1.9 pounds in Australia.¹ Primarily as a result of larger sheep inventories and the relative importance of this sector in relation to the national economies, both Australia and New Zealand generally benefit from a more developed and larger industry infrastructure (that is, such trained labor as shepherds and shearers, stock trucks, packing plant numbers and size, computerized marketing services, and so forth) when compared with the United States.

Lamb Growing Costs

Feed

In New Zealand and Australia sheep and lamb growers normally raise their animals almost exclusively on pasture and have essentially no expenses for grain or other concentrates (table 5-2).² Conversely, in the United States grains or other concentrates and protein supplements are a significant cost even under range management. The American Sheep Industry Association (ASI) estimates that feed costs (for the maintenance of the ewes, through the weaning of lambs) were the largest cost under range management. As a national average, grains and protein supplements are estimated to have accounted for about 19 percent of variable cash expenses in 1994 (table 2-9).

Climate and topography

Sheep and lambs are raised under a wide range of climates and topography in the United States, Australia, and New Zealand. In the United States, production regions include prime agricultural regions of the Midwest with fertile soils, rainfall nearly ideal for forages, and level topography. Conversely, some regions of the Western United States have less fertile soil, limited rainfall, and topography so steep as to limit agricultural production to sheep or goats.³ New Zealand sheep and lambs are raised under lowland, hill country, and high country conditions. Similarly, Australian sheep and lamb production regions include moist regions receiving 28 inches or so of rain per year, regions receiving slightly less, dry regions, and very dry regions.⁴

¹ The relatively small quantity of lamb meat production (in relation to the total sheep inventory) in Australia in comparison to that in the United States reflects the large share of the Australian sheep and lamb population that is kept mostly or entirely for the production of wool. The relatively small production of lamb meat (in relation to the sheep flock) in New Zealand relative to that in the United States reflects, in part, the higher average slaughter weight in the United States.

² Tony Bywater, professor of farm management, Lincoln University, interviewed by USITC staff, Christchurch, New Zealand, Mar. 28, 1995.

³ Miller, president, ASI, transcript of the hearing pp. 52-54.

⁴ Troup, president, SCA, interviewed by USITC staff, Feb. 7, 1995.

Among the countries under consideration, New Zealand appears to generally have the longest grazing season and the mildest climate. Australia has generally a mild climate and long grazing season but is subject to periodic droughts; indeed, as of April 1995, more than 45 percent of the sheep in Australia were in drought-plagued regions.⁵ A large portion of the sheep and lambs in the United States are raised in areas with harsh climates, such as West Texas, Colorado, and Wyoming.

Also, the milder climate under which most sheep and lambs are raised in Australia and New Zealand permits outdoor lambing and limits expenses associated with buildings,⁶ whereas in the United States, it is a common practice for lambs to be born indoors. In the United States, buildings are estimated by the USITC to have accounted for 8 percent of variable cash expenses in 1993 (table 2-9).

Labor

The United States appears to have a comparative labor disadvantage in the live sheep and lamb sector in relation to both Australia and New Zealand. Many U.S. growers employ shepherds from other countries, and some domestic interests have complained about U.S. Federal Government immigration regulations. In addition, some domestic interests have noted a shortage of sheep shearers in the United States. One U.S. grower noted that many sheep in the United States are sheared by crews from Australia and New Zealand.⁷ In contrast, both Australia and New Zealand appear to have abundant supplies of skilled labor in all aspects of the live sheep and lamb sector.⁸

Predator problems

Costs associated with losses to predators are apparently much lower for sheep and lamb growers in Australia and New Zealand. In Australia, there are some losses of sheep to the dingo⁹ and of lambs to red foxes.¹⁰ However, predators are reported not to be a serious problem for the Australian sheep and lamb sector. Losses to predators in New Zealand appear to be negligible.¹¹ As noted earlier, predator losses in the United States have

long been a major concern for domestic growers and were estimated to amount to US\$17.7 million in 1994.¹²

Other land use options

Because of the wide diversity of conditions in each of the three countries, generalizations about sheep and lamb production in the three countries under consideration are difficult. While portions of the Western United States have limited or no economically viable alternative to sheep, some sheep-raising regions of the Western United States could grow cattle, or grains, or hay. Agricultural alternatives in the Corn Belt are typically more extensive.

In parts of southern Australia, growers have considerable opportunities to substitute grains and wool-type for meat-type sheep.¹³ However, such a shift is expensive, requires a long period of time, and may not always be economically practicable.¹⁴

Producers in New Zealand probably have fewer options to lamb and sheep production than their counterparts in the United States or Australia. Grain production in New Zealand is generally precluded by fungus diseases associated with the moist climate, and the opportunity to grow wool-type sheep appears to be limited. Forestry and cattle production provide alternatives to sheep and lamb production in New Zealand, and, indeed, there appears to have been some such shifting in recent years.

Lamb Meat Packing and Processing Costs

Australia

Among the factors that seem important in evaluating the competitive conditions of the U.S. and Australian lamb packing and processing sector are labor unrest (strikes), worker wage rates, costs of animals for processing, and seasonal variations in the quantities of lambs available for slaughter and processing. The Australian meat packing and processing sector may be somewhat inefficient in relation to counterparts in other countries, including the United States and New Zealand (table 5-2). The Australian Industry Commission conducted a study on the competitiveness of the Australian meat industry. The Industry Commission found that despite some recent improvements, Australia's meat-processing industry operates at significantly higher cost than the processing industries of most countries (including those of the United States) with which it competes.¹⁵

¹² USDA, NASS, *Sheep and Goat Predator Losses*, Apr. 27, 1995, p. 1.

¹³ Industry Commission, *Meat Processing*, vol. 1, Apr. 20, 1994, p. 5.

¹⁴ Troup, transcript of the hearing, pp. 156-157.

¹⁵ Industry Commission, *Meat Processing*, vol. I (Melbourne, Australia: Australian Government Publishing Service, Apr. 1994), p. XV.

The Australian meat industry has had a high level of labor unrest which has adversely influenced the development of the meat packing and processing sector. In 1991,¹⁶ the number of days lost per 1,000 employees because of strikes and other labor actions was six times greater in the meat industry than in all manufacturing, mining, and transportation industries--1,535 days per 1,000 contrasted with 265 days per 1,000.¹⁷ In contrast, U.S. packers reported no significant changes in their production of lamb meat since January 1, 1990 because of strikes.¹⁸

A private study funded by the Australian Meat Research Corporation (MRC) in Australia and conducted by Booz-Allen & Hamilton found that processing costs in the Australian beef sector were much higher than in other countries, including in the United States, Argentina, Ireland, and New Zealand.¹⁹ One industry source reported that processing costs for the lamb sector would be similar to that of the beef sector, although the lamb sector was not separately reported in this study.²⁰

Notwithstanding the assessments by the Industry Commission, the Australian meat sector compares favorably with its U.S. counterpart by some measures since lamb meat packers and processors in Australia appear to benefit from relatively low-cost live animals for processing in relation to their counterparts in the United States. Additionally, average wage rates for packing house workers in the United States appear to exceed the range of Australian meat-processing industry workers, although detailed statistics are not available. Australian average weekly earnings in the meat sector in May 1993 ranged from AUS\$464 (equal to US\$324) to AUS\$579 (US\$393) depending on State or Territory,²¹ whereas, in the United States, the 1993 average weekly earnings in the meat packing sector was US\$403.60.²²

New Zealand

Among the factors that seem important in evaluating the competitive conditions of the U.S. and New Zealand packing and processing sectors, are profitability and such related factors as company debt levels, capacity utilization, costs of lamb for slaughter, nature of the work force, economies of scale, and technological innovations. Capacity in this sector appears to

¹⁶ Although 1991 is the most recent year for which data are available, the Industry Commission did not indicate that there had been a significant change in the situation in recent years.

¹⁷ *Meat Processing*, Apr. 20, 1994, p. 175.

¹⁸ The USITC received responses from all large-volume lamb packing companies in the United States, and these companies accounted for more than 89 percent of U.S. lamb slaughter.

¹⁹ *Meat Processing*, Apr. 20, 1994, p. 41.

²⁰ Bernard, divisional manager of AMLC, USITC staff interview, Sydney, Australia, Mar. 20, 1995.

²¹ *Ibid.*, p. 117.

²² U.S. average weekly earnings estimated by the staff of the USITC based on questionnaire response.

have been significantly reduced in 1994, as certain lamb meat-producing facilities were closed.

Notwithstanding profitability limitations, the New Zealand lamb packing and processing sector appears to have some advantages. As noted previously, New Zealand, in general, benefits from economies of scale (because of certain large plants and the relatively large lamb population), a geographically concentrated industry that minimizes transportation costs (lamb production areas are seldom more than 3 hours from a slaughter plant), and technological innovations, such as the "inverted chain" production system. The relatively large cost of converting to the inverted chain production system is apparently more economical in large-volume plants that can spread the cost over a large number of lambs.

Another difference noted between the U.S. and New Zealand lamb packing and processing sector is the ownership pattern either directly or through cooperatives--in the United States ownership by growers is minimal, whereas, in New Zealand, grower-owned cooperatives account for all but one of the major lamb packing and processing companies. However, there is no evidence that ownership patterns convey a competitive advantage.

The United States lamb packing sector appears to have been generally profitable during 1990-94 (as shown by responses to the Commission's questionnaire to packers), whereas, the New Zealand counterpart appears to have generally not been profitable. New Zealand lamb packers and processors appear to have had high levels of debt and interest payments. Also, excess capacity pressured packers to pay unsustainable high levels for live lambs for processing; expenses associated with closing plants discouraged exit from the industry. Booz-Allen & Hamilton found the New Zealand meat processing sector to be lower cost than the Australian but higher cost than that of the United States.

Production Fluctuations

The Australian Industry Commission noted that, among major meat types, lamb (and veal) in Australia exhibited the most variation in the quantity of production over a given period of time.²³ Lamb meat production in the United States is also known to be seasonal. The annual standard deviations of lamb meat production (as a percentage of annual average production)²⁴ for the United States and Australia for 1990-94 are shown in the following tabulation:²⁵

²³ *Meat Processing*, Apr. 20, 1994, p. 22.

²⁴ For example, in 1994, U.S. monthly production was more variable compared to Australian monthly production.

²⁵ The annual standard deviation as a percentage of annual average production was calculated by USITC staff from monthly production of lamb meat for each year.

<u>United States</u>	<u>Australia</u>
1990 . . . 6.9	12.2
1991 . . . 10.6	11.1
1992 . . . 9.7	6.9
1993 . . . 9.6	7.2
1994 . . . 15.3	9.6

Indeed, lamb meat production in the United States appears to be somewhat more variable than production in Australia in recent years. Seasonality of lamb meat production is thought to be of less significance to the New Zealand lamb meat sector because packers in that country typically freeze meat for reasons other than seasonality of production. They are thus able to store their product and to distribute it in response to market demands.²⁶

Live Lamb Cost to Packers

Table 5-3 and figure 5-1²⁷ show the prices received by growers for lambs marketed in New South Wales, Victoria, South Australia, and in the United States²⁸ during January 1990 through the first half of 1994; South Australia and Victoria account for most of the lamb meat exported to the United States, New South Wales, the location of a large share of Australia's population, is considered representative of the Australian domestic market.²⁹ The Australian prices are for lambs that are estimated to yield carcasses that weigh between 40 to 44 pounds, the size typically used for exports to the United States.

The prices of such live lambs in Australia are, on average, below such prices in the United States. However, it should be noted that there are important differences between animals in the two countries, specifically,

²⁶ Data for monthly lamb meat production were obtained for both the United States and Australia for the period January 1990-December 1994. Standard deviations were then calculated for each year of the time period, and an annual average was also calculated. Dividing the standard deviation by the annual average lamb meat production yielded the percentage of the standard deviation to the annual average lamb meat production. This ratio shows the volatility of production in Australia and the United States where increases in the percentages are positively correlated with more volatile production. For example, in 1990, the percentage of volatility in the United States was 6.9 percent, while, in Australia, it was 12.2 percent indicating that monthly production in the United States was sustained at more or less the same levels throughout the year. However, in Australia, production fluctuated considerably.

²⁷ Figure includes prices for Victoria, South Australia, and the United States.

²⁸ The U.S. price is the price for Prime/Choice slaughter lambs at San Angelo, Texas.

²⁹ USITC staff, fieldwork, Australia, Mar. 1995.

Source: U.S. prices for 1990-93 compiled from USDA, ERS, Red Meat Yearbook, (Statistical Bulletin No. 885), Aug. 1994, table 78, p. 80; 1994 compiled from USDA, ERS, "Cattle and Sheep Outlook", (LDP-CS-5) Feb. 14, 1995. Australian prices compiled from official statistics of the AMLC, Statistical Review, July 93-June 94, p. 15.

lambs in the United States are typically larger and, hence, yield larger carcasses.

The price of live lambs in the United States and Australia varies significantly from year to year. The average price in Victoria in 1990 was only 1 percent less than the U.S. average but was 24 percent less in 1992 and 4 percent less during the first half of 1994. The average price in South Australia in 1990 was 8 percent less than the U.S. average but was 30 percent less in 1992 and 8 percent less during the first half of 1994.

The average price of live lambs in Australia does occasionally exceed that of the United States. The average in Victoria exceeded that in the United States in 15 months during 1990-94, including 3 months in the first half of 1994, and the average in South Australia exceeded that of the United States in 9 months, including 2 months in the first half of 1994.

Table 5-4 and figure 5-2 show the price received by growers in New Zealand for the carcasses derived from the lambs they marketed during January 1990 through the first half of 1994. In New Zealand lambs for slaughter are typically not sold on a live basis and, hence, such data are not collected.³⁰ The price of lamb carcasses in New Zealand consistently averaged below such prices in the United States. However, it should be noted that the size of New Zealand lamb carcasses are smaller than those in Australia and significantly smaller than those in the United States and that the lambs in New Zealand are grass-fed.

Export Marketing

The United States has traditionally been a net importer of lamb meat. The share of U.S. lamb meat consumption accounted for by imports increased from 6.7 percent in 1990 to 11.4 percent in 1994, as the quantity of imports generally increased and domestic production declined (table 2-15). U.S. exports of lamb meat are negligible. Although estimated U.S. exports of live lambs have increased in recent years, in 1994 such exports were equal to only about 2 percent of the lamb crop.

New Zealand and Australia have traditionally been exporters of agricultural products, including meat. Exports to all markets accounted for 97 percent of New Zealand's and 23 percent of Australia's lamb meat production in 1994 (table 5-2). Both countries have long established channels of distribution, such as export-oriented companies and export arms of the Australian Meat and Live-stock Corporation (AMLC) and New Zealand Meat Producers Board (NZMPB), and infrastructure, such as ships and warehouses. Imports of lamb meat into both Australia and New Zealand were negligible during 1990-94.³¹

New Zealand prices compiled from New Zealand Meat and Wool Board's Economic Service, Annual Review of the New Zealand Sheep and Beef Industry, various issues.

**Figure 5-2
Lamb carcasses: Prices in the United States and New Zealand, by months, Jan. 1990-Oct. 1994**

Source: U.S. prices for 1990-94 derived from USDA, ERS, "Redmeat Yearbook." New Zealand prices derived from New Zealand Meat and Wool Board's Economic Service, "Annual review of the New Zealand Sheep and Beef Industry," various issues.

Domestic production supplies the bulk of U.S. consumption of lamb meat with the remainder supplied by Australia and New Zealand. Australia and New Zealand's market shares increased during 1990-94 as shown in the following tabulation (in percent):

<u>Year</u>	<u>United States</u>	<u>Australia</u>	<u>New Zealand</u>
1990 . .	93.3	3.6	3.1
1991 . .	93.0	3.9	3.0
1992 . .	92.4	4.2	3.5
1993 . .	88.9	6.5	4.7
1994 . .	88.6	6.8	4.7

Government Policies

The USITC was asked to provide information on government assistance regardless of whether that assistance may constitute subsidy under the U.S. countervailing duty law. The following section reviews direct payments to sheep and lamb growers in the United States, Australia, and New Zealand. General government support through government agencies, including the USDA, and agencies that can be viewed as their counterpart, Department of Primary Industries and Energy (DPIE) in Australia and Ministry of Agriculture and Fisheries (MAF) in New Zealand are reviewed. Also, government-sanctioned associations, the ASI, the AMLC, and the NZMPB are reviewed.

Australia and New Zealand direct support

Australian Federal Government support for the lamb sector, both live and processing, appears to be limited. A program associated with the Australian wool sector, the Wool Industry Supplementary Payment Scheme, described in chapter 3, made payments to sheep growers for wool. Total payments over the life of the program, which began in March 1991 and was terminated in 1992, were AUS\$311 million, AUS\$300 million of Australian Federal Government funds and AUS\$11 million of Australian Wool Realization Corporation funds.³²

New Zealand Government support for the lamb sector, both live and processing, also appears to be limited. As the result of a countervailing duty petition filed March 26, 1985, U.S. imports of lamb meat from New Zealand became subject to countervailing duties.³³ The U.S. Department of Commerce (DOC) conducts "administrative reviews" of foreign government programs as part of administering the U.S. countervailing duty law. On May 22, 1995, a DOC administrative review final determination was published reporting that the subsidy for the period April 1, 1992, through March 31, 1993, was *de minimis* for

³² Australian Wool Realization Commission, *Annual Report, 1991/1992*, Dec. 1, 1992, p. 12.

³³ 50 F.R. 37708, Sept. 17, 1985, "Final Affirmative Countervailing Duty Determination and Countervailing Duty Order; Lamb Meat From New Zealand."

all firms.³⁴ In addition, DOC determined that the Government of New Zealand has abolished all subsidy programs for lamb meat for a period of 3 consecutive years. Accordingly, the DOC announced it was revoking the countervailing duty order.³⁵

The aforementioned ITA determinations are consistent with recent publications, indicating that the Government of New Zealand significantly reduced its support for agriculture. Chapter 4 also noted that the New Zealand Federal Government has supported and scheduled to continue supporting research in the sheep sector.

United States

In the United States, the National Wool Act of 1954, as amended, provides for wool incentive payments to growers. However, the Omnibus Budget Reconciliation Act of 1993, Public Law 103-130,³⁶ provided for a phaseout of the wool and mohair programs over the 1994 and 1995 marketing years and repealed the Wool Act to be effective December 31, 1995. For the 1994 marketing year (payments made April 1995), producers are to receive only 75 percent of their calculated payment, and, for the 1995 marketing year (payments made April 1996), they are to receive only 50 percent. The Wool Act and other U.S. government programs are discussed in the "U.S. Industry and Market," section.

Research by Whipple and Menkhaus investigated the impacts of the Wool Act using an econometric model of the U.S. sheep-related products industry.³⁷ That analysis compared model runs with and without the Wool Act over the 1960-85 period. Their results suggest that the Wool Act has resulted in annual levels of wool production that are from 2 to 20 percent higher; domestic lamb production levels that are 1 to 17 percent higher; U.S. wool imports that are 1 to 6 percent lower; and lamb imports that are 1 to 23 percent lower. These results are supported by the Commission staff's econometric findings (presented later in this chapter) that eliminating Wool Act benefits should result in a slight drop in U.S. lamb meat production. However, testimony by the ASI at the Commission's hearing suggests that wool production is expected to fall after the Wool Act is eliminated, although there may be an increasing switch of livestock from wool-type to primarily meat-type animals.³⁸

³⁸ Transcript of the Commission hearing for investigation No. 332-357, Apr. 6, 1995: Orwick, director of Government Affairs, ASI, testimony, pp. 29 and 46; Harbaugh, Director, American Lamb Council, ASI, testimony, pp. 54-55; and Miller, president, ASI, Inc., testimony, p. 73.

General Government support

The Australian Federal Government (DPIE) operates a number of so-called "Sub-programs" that are related to agriculture and apply to, but are not limited to, sheep growers. These programs include the Livestock and Pastoral Sub-program; the Rural Adjustment and Services Sub-program; the Quarantine and Inspection Sub-program; and the Agricultural and Resource Economic Analysis Sub-program.

The New Zealand MAF is the main government agent in the agricultural sector. MAF programs include the Agriculture Quarantine Service, Animal Health Services, Dairy Services, Meat Services, and Plant Services.

In the United States a number of agriculture related programs are conducted by the USDA, including general research done by the Economic Research Service, Extension Service, and Animal and Plant Health Inspection Service. Although sheep and lamb growers may benefit from certain of these programs, the programs are not industry specific.

Government sanctioned associations

The Federal Governments of Australia, New Zealand, and the United States provide statutory authority for the AMLC, NZMPB, and ASI,³⁹ respectively. However, the governments do not necessarily provide funds to the organizations. Each of the organizations is funded almost exclusively by producers, although each has received limited contributions from its respective Federal Government and the contribution to the NZMPB was used for beef promotion. The government contributions were described earlier in this report.

Government leasing of grazing lands

In Australia and New Zealand almost all sheep and lambs grazed on public lands are wool-type (Merino) sheep that are not suitable for the production of lambs for meat. Public lands in Australia are typically leased for 99 years, whereas leases in New Zealand are for 11 years; in the United States leases are almost all for 10 years. In Australia an estimated 10 to 15 percent of the sheep spend at least part of the year on public lands, and in New Zealand, this figure is estimated to be 5 percent. According to the ASI, 25 percent of the U.S. sheep population spends a portion of the year foraging on federal lands.⁴⁰

³⁹ The enabling legislation for the ASI is the National Wool Act of 1954.

⁴⁰ Orwick, director, Government Affairs and Natural Resources, ASI, transcript of the hearing, p. 31.

Analysis of Demand for Lamb Meat

The following section provides a comparative assessment of factors affecting demand for lamb meat in the United States, Australia, and New Zealand. Table 5-5 summarizes these factors.

Product Form

Much of the imported lamb meat has characteristics that differentiate it from the domestic lamb meat. In the U.S. market, the preference and choice of individual consumers among fresh, chilled, or frozen lamb meat; carcass and cut size, and grain-fed or grass-fed lamb appear to vary considerably.

Fresh, chilled, or frozen lamb meat

Domestic lamb meat is typically sold fresh or chilled, whereas imported meat is often sold frozen (table 2-14). Some consumers prefer fresh meat because of perceived quality differences.⁴¹ Consumer concerns about frozen meat include how long the meat has been frozen and whether it has been thawed and refrozen. However, ASI officials report that of the sales of fresh or chilled lamb made to the food service sector, fully 90 percent are subsequently frozen by the food service entities and distributors.⁴² Also, an official of a major U.S. lamb breaker company⁴³ reported that there are certain customers, such as cruise lines, that prefer frozen lamb meat whether domestic or imported.⁴⁴

⁴¹ Research data show that the maximum length of time after slaughter in which chilled lamb meat remains suitable for human consumption ranges from 21 to 24 days, given optimum care of the meat. Beyond that point, bacterial growth, or so-called bacteria count, becomes excessive. Officials of the American Meat Institute (AMI), a trade association representing meat packers and processors, indicated that, by sealing lamb meat in certain plastic materials, its shelf life could theoretically be extended up to 8 weeks. Several officials of grocery chains indicated that, in practice, fresh or chilled lamb meat and other meats are sold well before they exceed their maximum shelf life. The officials indicated that lamb meat must be sold within a week or so after the lamb is slaughtered. After this time, the meat darkens and can be sold only at a significant discount.

⁴² Harbaugh, ASI, transcript of the hearing, p. 26.

⁴³ Official of B. Rosen and Sons, Inc., telephone conversation with USITC staff, Apr. 26, 1995.

⁴⁴ The AMLC describes frozen lamb as being at -10°C or below (14°F or below) and also defines fresh (chilled) lamb as maintained at -1.5°C to 3°C (29°F to 37°F) for shipping. The AMI reports that there are no industry or U.S. Federal Government specifications defining the terms chilled or frozen, but, as a general rule, frozen meat is expected to be 0°F or colder and chilled meat is expected to be between 28°F and 32°F . The ASI reference to "fully 90 percent of sales of fresh or chilled lamb made to the food service sector being frozen by the food service entities and distributors" refers to lamb meat that is between 28°F and 32°F that the ASI considers to be frozen.

Table 5-5
Competitive conditions¹ reflecting demand in the U.S., Australian, and New Zealand lamb meat sectors, 1994

	Competitive conditions	
	United States	New Zealand
Analysis of demand for lamb meat:		
Product form (fresh/frozen, large/small cuts, grain-fed/grass-fed)		
Prices of Australian and New Zealand lamb meat in the U.S. market: ²		
Fresh:		
Carcasses	(³)	More than domestic
Racks	(³)	More than domestic
Legs	(³)	Generally more than domestic
Shoulders	(³)	Less than domestic since May
Frozen:		
Carcasses	(³)	Less than fresh domestic
Racks	(³)	More than fresh or frozen domestic
Legs	(³)	Less than frozen domestic
Shoulders	(³)	Less than fresh domestic
Retail prices in home markets	More than Australia and New Zealand	Less than the U.S.
Promotion expenditures	+	+
Transportation costs to the U.S. market	(³)	+
Exchange rates	(³)	(⁵)

¹ May vary according to area of country considered.

² The following observations compare the price of imported lamb meat with domestic lamb meat.

³ Not applicable.

⁴ Australian prices are not available.

⁵ The effect of the exchange rate of the Australian or New Zealand dollar against the U.S. dollar varies over time depending on the supply and demand conditions prevailing in the currency markets.

Note.-Among the competitive conditions ranking factors, "+++" is most favorable, "++" is favorable, and "+" is least favorable.

Source: Estimated by the U.S. International Trade Commission staff.

The AMLC⁴⁵ reports that fresh (chilled) Australian lamb is exported to the United States under the FARL program, and the product must meet specifications.⁴⁶ FARL products are sold to both the retail and food service sectors and, according to the AMLC, its product is most directly comparable to domestic lamb.⁴⁷ The NZMPB reports that chilled New Zealand lamb is sold almost exclusively to particular market segments, such as specialty retail outlets and white table cloth restaurants.⁴⁸

The NZMPB also reported that, for the food service trade, the preference for fresh lamb, while undeniable, is less significant and is offset to a certain extent by characteristics of the frozen product including the longer shelf life and more uniform pricing throughout the year.⁴⁹

Carcass and cut size

Domestic lamb carcasses and the cuts derived from them are typically larger than imported carcasses and cuts. Lamb carcasses vary significantly in size mostly as the result of 1) variations in the age at which animals are slaughtered--from about 2 months to 14 months;⁵⁰ 2) genetics--U.S. breeds are typically larger than Australian and New Zealand breeds; and 3) the manner in which the animals are raised, with grain-fed animals typically being heavier than grass-fed. The average carcass weight for lambs slaughtered under Federal inspection in the United States in 1994 was 63 pounds each.⁵¹ Australian carcasses averaged about 40 pounds each.⁵² Lamb carcasses in New Zealand averaged 33 pounds.⁵³

A U.S. meat distributor reported that, when some restaurants specifically requested large lamb cuts, he supplied them with domestic; when other restaurants requested smaller cuts, he supplied them with imports.⁵⁴ Another distributor reported that typical distributors offer racks that include a 32-ounce domestic rack, a 22-ounce Australian rack and a 12-ounce New Zealand rack,⁵⁵ and an NZMPB official testified that the U.S. market for New Zealand carcasses tended to be for lighter carcasses.⁵⁶

⁵⁶ Bryant, transcript of the hearing, p. 128.

Grain-fed or grass-fed lamb

According to an official of the ASI, most domestic lamb meat is derived from grain-fed animals,⁵⁷ whereas New Zealand and Australian lamb meat is derived from grass-fed animals. Domestic interests contend that the American consumer seems to prefer the taste of grain-fed lamb.⁵⁸ However, the AMLC has stressed the range-fed (grass-fed) nature of Australian lamb in its FARL promotional campaign.

Further processed cuts

In the United States shipments of boxed lamb (primal cuts) to major retail distributors is becoming the norm.⁵⁹ However, some packers and processors are providing further processed cuts, including seasoned retail display case-ready products.⁶⁰

In addition to some carcasses and primal cuts, imported lamb meat also includes further processed items. According to the AMLC, FARL products include value added primal and subprimal⁶¹ cuts.⁶² Distributor testimony suggests that a large share of imported lamb meat from Australia and New Zealand consists of relatively high-priced and further processed cuts.

Questionnaire Responses of Importers and Purchasers

Commission questionnaires were sent to nine purchasers and nine importers and requested respondents to rate as superior, comparable, or inferior Australian or New Zealand lamb meat in relation to U.S.-produced lamb meat for a number of factors including, but not limited to, price, quality, and consistency. Purchaser and importer respondents were also asked to rank as unimportant, somewhat important, important, and very important the aforementioned factors by the power they have to influence their decision in purchasing (or importing) domestic or imported lamb meat. Separate responses were requested for fresh or chilled lamb meat and for frozen lamb meat. Not all respondents rated or ranked all factors. For analytical purposes, in some instances, responses are combined for fresh and frozen lamb meat, thus, the total number of responses may exceed the number of respondents.

⁶¹ Primal cuts may be divided into smaller cuts referred to as subprimal cuts; such cuts are, in turn, divided into retail cuts.

⁶² Prehearing brief of the AMLC, p. 9.

Factors Other Than Price

The Commission questionnaire requested comparisons between imported and domestic lamb relating to such factors as product quality, palatability, fat content, consistency of product specifications, shelf life, availability, packaging, and servicing. Generally, the most common response to the aforementioned factors was that the imported and domestic products are comparable.

Purchasers responding to the Commission questionnaire demonstrated a diversity of opinions concerning the importance of cut size in a comparison among the U.S., Australian, and New Zealand lamb meat. For imports, 5 of the 15 purchasers reported the imports to be superior; 5, comparable; and 5, inferior. The 11 importers' responses were somewhat less diverse: 6 reported the imports to be superior; 1, comparable; and 4, inferior. Of the 17 purchasers' responses, 13 reported the size of cuts to be very important or important; 3, somewhat important; and 1, unimportant.

Sixteen of 18 purchaser responses ranked quality of lamb meat to be very important regarding purchase decisions. Unlike purchasers, importers were slightly less certain about quality. Although three reported that quality was very important, and six reported quality important, four reported that it was unimportant.

Commenting on terms of sale, of the 19 purchasers, 8 reported Australian terms of sales to be comparable to the United States; 8, New Zealand terms of sales to be comparable; and 3, Australia terms of sale to be inferior. Eight purchasers reported terms of sale to be an important influence, and eight, only somewhat important or unimportant. Only 2 importers reported terms of sale to be important, and 10, somewhat important or unimportant.

Prices of Australian, New Zealand, and U.S. Lamb Meat in the U.S. Market

The Commission sent questionnaires to nine purchasers of lamb meat of Australian, New Zealand (imports), and U.S. (domestic) origin. The retailers included selected large-volume retail grocery chains and cruise-ship lines. The recipients were asked, among other things, to report the prices they paid for lamb carcasses and selected cuts, specifically ribs (racks), legs, and, shoulders, during January 1990, through December 1994.

The results from responses to the Commission's questionnaire are presented in percentage differences between the price of domestic and imported products for reasons of confidentiality. Respondents did not necessarily provide data for all cuts, for all months, and for each of the countries. It should be noted that the prices reported represent a range of specifications for each of the categories and that some respondents changed the specifications of the product they purchased during the reporting period; therefore, price comparisons must be made with caution. Price comparisons data are presented below for fresh imported and fresh domestic meat prices, frozen imported and frozen domestic prices, and for frozen imported meat and fresh domestic.

Purchasers' Questionnaire Responses

Prices paid by purchasers of Australian fresh or chilled racks were reported for most of the last half of 1992, parts of 1993 (the first 2 months), and for 1994. The prices paid ranged from 5 to 47 percent less than the prices of domestic fresh or chilled racks during 1992 and 1993 (figure 5-3). However, during 1994, prices for Australian fresh racks were higher by 7 percent to 123 percent. Prices were also reported for Australian frozen racks for 1990 and 1991, and those prices were typically 40 to 60 percent below the prices paid for the domestic fresh product (figure 5-4).

Prices paid for Australian fresh or chilled legs were reported for July 1992 through 1994. The prices paid for Australian legs were less than the prices for domestic legs from July 1992 until April 1993 by 8 to 37 percent (figure 5-5). However, since May 1993, the price for Australian legs was generally higher--1 to 62 percent. Prices were also reported for Australian frozen legs for 1990 through 1992, and those prices were significantly below the prices paid for the domestic fresh product.

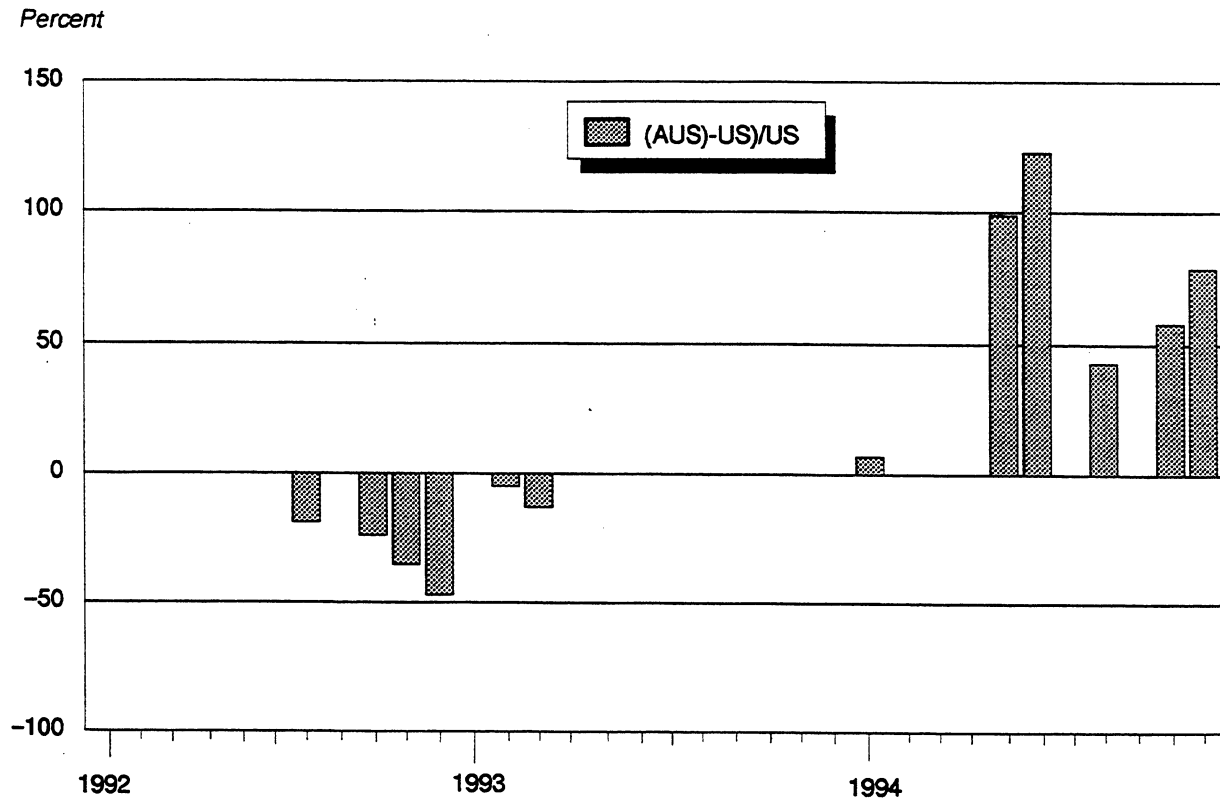

Prices paid for Australian fresh or chilled shoulders were reported for July 1992 through 1994. The prices paid for Australian shoulders were higher than domestic fresh shoulders (by 1 to 51 percent) through April 1994 (figure 5-6). However, beginning in May 1994, the price reported for Australian shoulders was lower by 1 percent to 34 percent.

Prices paid by purchasers for New Zealand fresh or chilled carcasses were higher than the domestic price in every month between March 1993 and December 1994 (the only months for which comparisons are reported), with the New Zealand price being 19 to 59 percent higher (figure 5-7).

Prices paid by purchasers for New Zealand frozen racks were also higher than the domestic frozen rack prices in every month between January 1992 and December 1994 (the only months for which comparisons are reported), with the New Zealand price being between 26 and 106 percent higher (figure 5-8). Price comparisons between New Zealand frozen racks and domestic fresh racks show that New Zealand frozen racks were lower priced than domestic fresh racks in every month except December during 1990 but, thereafter, generally higher. New Zealand frozen racks were priced higher than domestic fresh racks in every month in 1994 (between 21 and 91 percent higher in that year) (figure 5-4).

New Zealand fresh leg prices were generally below the prices for domestic legs during 1990 through April 1993 and, thereafter, were generally above the domestic price although there were some months in which the New Zealand prices were lower (figure 5-5). Prices paid for New Zealand fresh or chilled shoulders were rather stable during 1990 and through the first half of 1994 whereas the price for domestic shoulders was rather unstable. The domestic shoulder prices fluctuated above and below the New Zealand price (figure 5-6). However, beginning in May 1994, the domestic price rose above that of the New Zealand and ranged from 8 percent above to 30 percent above.

Importers' questionnaire responses

The Commission also sent questionnaires to nine importers of Australian and New Zealand lamb meat. The importers were asked, among other things, to report the prices they received for lamb carcasses and selected cuts, specifically racks, legs, and shoulders during January 1990-December 1994.

Prices importers reported receiving for frozen New Zealand carcasses during March 1993, through December 1994, (the only period for which comparable prices were reported) were between 15 and 43 percent below prices purchasers reported paying for fresh domestic carcasses.

Between January 1990 and February 1993, prices importers reported receiving for fresh New Zealand racks were less than the prices purchasers reported paying for fresh domestic racks in all but 1 month in 1990, 7 months in 1991, 2 months in 1992, and the first 2 months of 1993. However, since March 1993, the price of fresh New Zealand racks has exceeded the price purchasers reported paying for domestic fresh racks, with the margin ranging from 5 to 144 percent.

Importers reported prices for frozen Australian legs during every month but 1 during 1993-94 were below prices purchasers reported paying for frozen domestic legs (between 9 and 27 percent below). Also, importers' prices for frozen New Zealand legs were below (less than 1 percent to 13 percent) prices purchasers reported paying for frozen domestic legs in every month during 1993-94.

Prices importers reported receiving for frozen Australian shoulders were below the prices purchasers reported paying for fresh domestic shoulders in every month during 1990-94, with the margin ranging from 7 to 64 percent. The importers' price for frozen New Zealand shoulders exceeded the purchasers' price of fresh domestic shoulders in the first 4 months of 1990 but was less than the prices purchasers reported paying for fresh domestic shoulders during May 1990 through December 1994, with the margin ranging from less than 1 to 59 percent.

Purchasers overwhelmingly reported imports to be superior in price in a comparison among the United States, Australia, and New Zealand. Combining the responses for fresh, chilled, and frozen lamb, eight purchasers reported that the Australian price was superior; six, that the New Zealand was superior; none, that the price was comparable; and only one, that New Zealand fresh lamb was inferior. Purchasers also overwhelmingly reported imports to be superior in terms of consistency of product price. Seven reported that the Australian price consistency was superior; six, that the New Zealand price was superior; only one, that price is comparable; and only one, that New Zealand fresh lamb was inferior.

Price and consistency of price were reported to be very important influence for U.S. purchasers of lamb meat by 10 of the 18 respondent purchasers, and an important influence by 8. However, quality was reported to be a very important influence in 16 responses and availability was ranked as very important in 15 responses. No respondent purchasers of U.S., Australian,

or New Zealand lamb meat ranked quality, availability, price or price consistency as somewhat important or unimportant.

Unlike the purchaser, the nine respondent importers were less certain about price. None reported price to be very important; five, important; and four, somewhat important. Consistency of product price was reported to be very important by two importers; important, by four; somewhat important, by three; and unimportant, by four.

Responding to the Commission's questionnaire, importers reported that fresh or chilled racks from Australia were typically priced below racks from New Zealand; fresh or chilled legs from New Zealand were priced below legs from Australia; and fresh or chilled shoulders from New Zealand were generally priced below shoulders from Australia (except in the last quarter of 1994). Frozen racks from Australia and New Zealand were relatively close in price, until the last half of 1994 when Australian prices rose and New Zealand prices declined. The price of frozen legs and shoulders from Australia was typically below the price of their counterparts from New Zealand.

In general, the prices paid by importers were more volatile than the prices paid by purchasers and, in general, the margin or difference between the price paid by importers and purchasers is small, except for frozen ribs from New Zealand. Commenting for imported fresh, chilled, or frozen lamb combined, none of the importers reported that imported lamb meat was superior in price to domestic; three, that the price was comparable; and four, that imports were inferior. However, nine importers reported imports to be superior in terms of consistency of product price and two reported comparability. For terms of sale, there were only three respondents, all of whom reported comparability.

Retail Prices in the United States, Australia, and New Zealand

Retail lamb cut prices in Australia and in the United States are shown in table 5-6. The Australian prices are low in relation to such prices in the United States. However, they include cuts from lambs that are estimated to yield carcasses that weigh between 18 to 35 pounds, and such lambs are typically lower priced than heavier lambs. Retail prices for New Zealand lamb chops and shanks in the home market are shown in table 4-5. Such prices are less than U.S. prices for similar cuts reflecting cuts derived from smaller carcasses.

Table 5-6
Lamb: Retail prices for selected cuts in the United States and selected cities in Australia 1991-94

(U.S. dollar per pound)

Item/Year	Sydney	Melbourne	Brisbane	Adelaide	Perth	Hobart	United States

Promotion Expenditures

During the course of the investigation, including the public hearing, domestic interests expressed concern and interest about promotional campaigns. The following discussion provides information, including expenditures, on promotional programs in the U.S. market.

The AMLC expenditures for export marketing in the United States declined from AUS\$14.4 million (US\$10.1 million) in the Australian fiscal year⁶³ 1993 to AUS\$9.8 million (US\$6.9 million) in 1994.⁶⁴ The AMLC reports that its total export marketing expenditures in the United States include expenditures for meat of other species of animals, including beef, accounting for a large share of Australian meat sales in the United States. The total AMLC expenditures also include administrative costs. AMLC expenditures on lamb meat sales in 1994 promote only FARL lamb and amounted to about US\$1.5 million, including limited expenditures in Canada.⁶⁵

The New Zealand Spring Lamb Company (which is owned jointly by the NZMPB and by three New Zealand meatpackers) reported that it spends about US\$120,000 to US\$180,000 per year on lamb meat promotion in the United States.⁶⁶

ASI expenditures for lamb marketing amounted to US\$2.5 million in the year ending September 30, 1994.⁶⁷ On a per-pound basis, promotional expenses for lamb by the AMLC appear to amount to about US6.6¢, whereas promotional expenses by the ASI appear to amount to about US0.8¢.

The 10 purchasers responding to the Commission's questionnaire on promotional programs, reported that promotional programs, in general, among the United States, Australia, and New Zealand were comparable. Of the 10 purchaser respondents, 1 reported that the Australian promotional programs for fresh lamb were superior, 1 reported that those of the New Zealand were superior, and 3 reported that the Australian programs were inferior. None of the purchasers reported the promotional programs to be very important factors influencing their purchases. However, four reported them important; eight, somewhat important; and six, unimportant. In general, five of the seven importers reported promotional programs for imports to be inferior to domestic; however, one reported comparability, and one reported the imports to be superior. Nine importers reported that promotional programs were generally unimportant factors influencing purchase decisions, but, for fresh lamb, two respondents reported that they were very important, and one reported them to be important.

⁶³ The Australian fiscal year is July 1-June 30.

⁶⁴ AMLC 1993-1994 Annual Report, p. 58, and postconference brief of the ASI.

⁶⁵ Counsel for the AMLC, telephone conversation with USITC staff, May 12, 1995.

⁶⁶ Graham Valentine, chairman, and Llew Pointon, general manager of the New Zealand Spring Lamb Company, interviewed by USITC staff, Wellington, New Zealand, Mar. 27, 1995.

⁶⁷ ASI Financial statements as of September 30, 1994, p. 14.

Transportation Costs

While all lamb meat suppliers face internal transportation costs within the United States, Australian and New Zealand lamb meat suppliers in the U.S. market face an obvious disadvantage in terms of international transportation costs. Transportation rates applicable to U.S. imports from Australia and New Zealand were reported to average 85¢ per pound by air and 24¢ per pound by surface.⁶⁸

Exchange Rates

Table 5-7 provides nominal U.S./New Zealand and U.S./Australian exchange rates in terms of U.S. dollars per New Zealand or Australian dollar. The exchange rate between two freely convertible currencies (such as between the U.S. dollar and the dollar of New Zealand or Australia) reflects the supply and demand conditions for these currencies in those countries. Such changes affect trade between countries through the exchange rate effects on prices--here the prices of foreign lamb denominated in U.S. dollars.⁶⁹ Generally, U.S. meat distributors who import foreign lamb into the United States⁷⁰ and foreign lamb producers who market their lamb in the United States⁷¹ testified that exchange rate movements are important and that exchange rate movements are a closely watched variable.

The two quarterly exchange rates did not vary much over the 1990:1-1994:4⁷² period. This suggests that the values of the U.S. dollar relative to the New Zealand and Australian dollars were stable and did not vary much over this period.

The U.S. dollar weakened slightly by about 5 percent relative to the New Zealand dollar over the 5-year period: a New Zealand dollar was worth 59.3 U.S. cents in 1990:1 and 62.2 U.S. cents in 1994:4. Throughout this period, the exchange rate varied within the range of 0.51-0.62.

The U.S. dollar strengthened slightly by 1.3 percent relative to the Australian dollar over the same period: an Australian dollar was worth 76.6 U.S. cents in 1990:1 and 75.5 U.S. cents in 1994:4. Throughout this period, the exchange rate varied within the band of 0.67-0.81.

⁷² Quarters are denoted numerically by the number placed on the right side of the colon, with "1" reflecting the January-March quarter, "2" reflecting the April-June quarter, etc.

Table 5-7

Nominal exchange rates¹ of New Zealand and Australia: Average quarterly rates in U.S. dollars per unit of non-U.S. currency

Period	New Zealand Exchange Rate	Australian Exchange Rate
1990: Jan.-Mar.5934	.7659
Apr.-June5785	.7681
July-Sept.6088	.8087
Oct.-Dec.6071	.7824
1991: Jan.-Mar.5974	.7784
Apr.-June5846	.7719
July-Sept.5739	.7819
Oct.-Dec.5607	.7841
1992: Jan.-Mar.5437	.7531
Apr.-June5401	.7584
July-Sept.5427	.7312
Oct.-Dec.5259	.6986
1993: Jan.-Mar.5196	.6875
Apr.-June5407	.6949
July-Sept.5507	.6694
Oct.-Dec.5519	.6686
1994: Jan.-Mar.5697	.7078
Apr.-June5815	.7246
July-Sept.6016	.7389
Oct.-Dec.6902	.7554

¹ Rates are the nominal "rh" rates which are average quarterly rates specified in U.S. dollars per unit of foreign currency: The "New Zealand exchange rate" reflects U.S. dollars per New Zealand dollar and the "Australian exchange rate" reflects U.S. dollars per Australian dollar.

Source: International Monetary Fund. *International Financial Statistics*, relevant monthly issues, Mar. 1994-Jun. 1995.

During the 1990:1-1994:4 period, both exchange rates, and hence the U.S. dollar values relative to the New Zealand and Australia dollars, varied mildly within narrow bands. Consequently, exchange rate variation likely had mild impacts on U.S. lamb imports from these countries.

**Econometric Relationships Among Lamb Meat Imports,
Production, and Prices^{73, 74}**

In previous sections of this report, important issues as to the role of lamb meat imports in the U.S. market, including the substitutability of U.S. and foreign lamb meat, have been raised. Additionally, U.S. growers have cited the termination of the wool program as an important factor that will affect U.S. lamb meat supply in future years. More specifically, whether imports markedly or insignificantly influence quantities and price of U.S.-produced lamb (hereafter domestic lamb), whether the domestic lamb quantity and price of domestic lamb elastically or inelastically respond to each other, or whether eliminating the Wool Act benefits will greatly or inconsequentially influence the U.S. sheep-related markets are important facets of the competitive environment that producers and consumers face. And yet, while such relationships are implied by theory to some degree, it is shown below that the degrees to which such relationships hold are in great debate both in this investigation and for agricultural economists generally. This degree of contention provides an opportunity to use an econometric modelling approach to provide empirical insights on the degree to which such relationships hold. In this section of the report, an econometric model is estimated and used to examine the relationships between imports, domestic lamb slaughtered and

⁷³ Commissioner Newquist notes that in the context of this investigation, economic modelling provides only "estimates" regarding the impact of any event or series of events (e.g., increases in imports, elimination of Wool Act assistance) on the domestic lamb industry.

In his view, economic models rely on the manipulation of a number of assumptions and variables, all of which differ according to the information sought and the judgment and prejudices of the modeler. Thus, models measuring the impact of a single event can and do produce widely divergent "results."

For purposes of this investigation, therefore, Commissioner Newquist considers economic modelling to be but one of many tools available to the Commission to analyze and assess the domestic lamb industry.

For further discussion of Commissioner Newquist's understanding of economic modelling, particularly its limitations, see, *The Economic Effects of Antidumping and Countervailing Duty Orders and Suspension Agreements*, Inv. No. 332-344, USITC Pub. 2900 at XI ("Views of Commissioner Don Newquist") (June 1995); see also, *Potential Impact on the U.S. Economy and Industries of the GATT Uruguay Round Agreements*, Volume I, Inv. No. 332-353, USITC Pub. 2790 at I-7, n.17 (June 1994); *Potential Impact on the U.S. Economy and Selected Industries of the North American Free-Trade Agreement*, Inv. No. 332-337, USITC Pub. 2597 at 1-6, n.9 (January 1993).

⁷⁴ For Commissioner Bragg's views on economic modelling, see *The Economic Effects of Antidumping and Countervailing Duty Orders and Suspension Agreements*, Inv. No. 332-344, "Views of Commissioner Bragg," at XIII-XIV.

consumed, U.S. wool production, producer prices received for lamb and wool, and the U.S. wool program.

Modelling Approach

An economic model can be useful to help illuminate the competitive conditions affecting the U.S. sheep-related markets, and this requires capturing important relationships among the lamb growing, lamb meat producing, and wool producing sectors, as well as the lamb import markets. Therefore, modelling the industry at the farmgate appears desirable for this investigation.⁷⁵ As noted earlier, decisions made by lamb growers ultimately determine the supply of domestic lamb meat to the U.S. market. Each year lamb growers assess the prices and net returns received from slaughter lambs and decide if ewe lambs will be slaughtered or retained as a capital good for breeding purposes. The decision to retain ewes for breeding indicates optimism, whereas the decision to sell lambs for slaughter indicates that farmers do not anticipate high enough prices to hold back lambs for increased future production.

To estimate likely relationships in the U.S. lamb meat industry, Commission staff estimated a vector autoregression (VAR) model of the following system of annual U.S. sheep-related market variables:

1. U.S. equilibrium levels of lamb/sheep meat slaughtered and consumed (hereafter, equilibrium domestic meat quantity or equilibrium "lamb" meat quantity)⁷⁶
2. U.S. market price for lamb (hereafter, lamb price)
3. U.S. wool production

⁷⁵ Recently, the Commission conducted an econometric analysis of the effects on the U.S. lamb meat industry at the wholesale (i.e., meat packing) level [see USITC, *The Econometric Effects of Antidumping and Countervailing Duty Orders and Suspension Agreements*, Investigation No. 332-344, pub. 2900]. The previous investigation's modelling work focused on estimating the effects of specific countervailing duty orders on the U.S. lamb meat industry, while this investigation's modelling effort focuses on the more general task of revealing the competitive conditions characterizing the U.S. sheep-related markets and focuses on markets at the farm level. Consequently, the model approaches are necessarily different, and modelling results are not directly comparable.

⁷⁶ This quantity is hereafter referred to as lamb meat because most of the quantity is lamb meat. In 1994, about 93 percent of sheep-related meat production was lamb meat, and only about 6 percent was mutton. See U.S. Department of Agriculture, National Agricultural Statistics Service, *Livestock Slaughter, 1994 Summary*, publication No. Mt An 1-2-1(95), March 1994, pp. 5, 84. These data are provided in appendix K.

4. Wool price received by U.S. wool producers (hereafter, market wool price)
5. Ratio of the Wool Act's support price to the market wool price (hereafter, RATIO)
6. U.S. lamb meat imports (hereafter, lamb imports)

Equilibrium domestic meat quantity is total U.S. lamb and mutton slaughtered (consumed) in millions of pounds, published by the U.S. Department of Agriculture (USDA).⁷⁷ The official U.S. Department of Commerce data on imported lamb quantities (millions of pounds) serve as U.S. lamb meat imports. Lamb price is the average price of spring lambs (slaughter, Choice) of either 75-105 or 80-110 pounds, at Sioux Falls, South Dakota, compiled by the USDA's Agricultural Marketing Service (USDA, AMS).⁷⁸

Following Whipple and Menkhaus, the model includes both U.S. wool production quantities and the relevant wool price variables to account for jointness of the lamb meat and wool production processes.⁷⁹ U.S. wool production is reflected by shorn wool production published by the USDA, Agricultural Stabilization and Conservation Service (USDA, ASCS).⁸⁰ The two rates of return relevant to U.S. wool producers are the market price for wool and the ratio of the wool support price over the market wool price

⁷⁷ For 1970-93 data, see USDA, Economic Research Service (ERS), *Red Meats Yearbook 1994* (Statistical Bulletin No. 885), table 97, p. 99. For 1958-69 data, see USDA, ERS, *Livestock and Meat Statistics*, relevant supplement issues. The 1994 data were obtained from USDA, ERS, *Cattle and Sheep Situation and Outlook Report*, Feb. 14, 1995. These data are provided in appendix K.

⁷⁸ These unpublished prices constituted the only consistent U.S. live lamb price series located by Commission staff since the 1950s. Prices cited in table 2-10 (Choice slaughter lambs) were not used because they were not available for an adequate time frame and with enough observations to use in this econometric model. The data were obtained from USDA, AMS by private communication with Commission staff. Because of shutdowns and subsequent reopenings of price-reporting meatpacking plants in the Sioux Falls, SD, area, a price was not reported for 1992, but was reported thereafter for 1993 and 1994. Staff used the 1992 price value of feeder lambs (90-110 pounds), as a 1992 value proxy. Commission staff deemed this number to be the closest substitute for the 1992 value from the price data sheets obtained from USDA, AMS. These data are provided in appendix K.

⁷⁹ See Glen D. Whipple and Dale J. Menkhaus, "Welfare Implications of the Wool Act," *W. J. Agricultural Economics* vol. 15, No. 1 (July 1990), pp. 33-44.

⁸⁰ USDA, ASCS published the 1958-93 data in *ASCS Commodity Fact Sheet, Wool, 1993*. The 1994 shorn wool estimate was obtained by Commission staff in a private communication with USDA, ASCS staff. These data are provided in appendix K.

(RATIO).^{81,82} RATIO serves as a per-unit return to wool production over and above the market price paid by the Federal Government to the producer. The wool support price and the market wool price were obtained from USDA, ASCS.⁸³

The effects of world lamb markets are reflected in this model through inclusion of a single import quantity variable. Foreign levels of production, domestic demand, export supply, and foreign lamb meat prices are exogenously determined at the farmgate level.⁸⁴

As stated, theory implies that, to some degree, imports may influence the quantity and price of domestic lamb, that U.S. lamb price and quantity respond to each other, and that elimination of the Wool Act will influence the U.S. sheep-related markets. Yet the degree to which these three relationships hold are highly debated by the U.S. producer and foreign producer interests who testified in this investigation, and by agricultural economists in the literature.

First, there is little or no consensus on the degree of influence that imports and rates of U.S. market penetration from imports, have played, and are playing, in the industry's competitive structure; opinions "run the full gamut." U.S. lamb-producing interests⁸⁵ claim that the primarily frozen, smaller-cut, and range-fed imports and the primarily fresh, larger-cut, and grain-fed domestic lamb are sufficiently similar to directly compete in the same markets and result in the suppression of U.S. prices and the displacement of U.S. lamb. At other end of the spectrum, the foreign lamb-producing

⁸¹ According to Whipple and Menkhaus, there are two per-unit rates of wool return relevant to the farmer: the wool support price (when the market price has been below the support price) and the market price. See Glen D. Whipple and Dale J. Menkhaus, "Wool Act."

⁸² RATIO was included as a separate endogenous variable because Federal Government behavior in determining the wool support price, RATIO's numerator, was clearly endogenous. Over the 34-year estimation period, the support price changed 23 times, generally trended upward from \$0.62 to \$2.09 per pound, and often increased and decreased from year to year. See USDA, ASCS, "Commodity Fact Sheet, Wool, 1993." Data on the U.S. wool support price and the market price of U.S.-produced wool required to calculate RATIO are included in appendix K.

⁸³ Ibid.

⁸⁴ Other studies that have modeled the U.S. lamb meat industry at the farmgate level have also excluded foreign market variables, such as import prices, from demand and supply equations. See G. Whipple and D. Menkhaus, "An Econometric Investigation of the Demand for lamb," *Sheep Industry Development Research Journal*, vol. 5, No. 1, 1989, pp. 7-11, and Texas Agricultural Marketing Research Center (TAMRC), Lamb Study Team, *Assessment of Marketing Strategies to Enhance Returns to Lamb Producers*, TAMRC Commodity Market Research Report CM-1-91 (College Station, TX: Texas A&M University, Dec. 1991).

⁸⁵ See transcripts of the Commission hearing on investigation No. 332-357, Apr. 6, 1995: testimony generally at pp. 13-32; and testimony of Pierce Miller, president, ASIA, at pp. 38-39.

interests⁸⁶ claim that domestic and imported products are sufficiently different so as not to compete with each other at all, and not result in U.S. lamb price suppression and in displacement of U.S. lamb quantities. Recent Commission research,⁸⁷ conducted at the wholesale market level as opposed to the farm-level focus of the present investigation, suggests an answer between these two extremes: that imports have had minor effects on U.S. lamb meat and lamb import markets.

Secondly, the degree that U.S.-produced quantities and U.S. prices respond to each other illuminates another major competitive condition of the U.S. industry in great contention. Estimates of the price elasticity of demand range along about a ten-fold spectrum, from -0.3 to -4.0,⁸⁸ a range which includes the Commission's recent wholesale level estimate of -0.8.⁸⁹ Estimates of the price elasticity of U.S. supply range along an even larger spectrum from 0.01 to 11.38, a range which includes the recent Commission wholesale level estimate of 2.8.⁹⁰

And thirdly, the future impacts on the U.S. sheep-related industry and the industry's competitive conditions from the elimination of the half-century-old Wool Act benefits, are unknown. Whipple and Menkhaus⁹¹ found that the Wool Act benefits to U.S. producers have been generally modest, with implications to modest burdens to farmers when the benefits are eliminated. Anderson⁹² and U.S. lamb and wool producer interests,⁹³ on the other hand, claim that elimination of Wool Act benefits will incur more severe losses for U.S. producers.

⁸⁶ See transcripts of the Commission hearing on investigation No. 332-357, Apr. 6, 1995: testimony of Laurie Bryant, North American director, New Zealand Meat Producers Board (NZMPB), at pp. 128-34; and testimony of Frances Cassidy, chief executive officer, Australian Meat and Livestock Corporation, at pp. 164-66, 169-70, and 174-75.

⁹³ Transcripts of the Commission hearing on investigation No. 332-357, Apr. 6, 1995: testimony of P. Orwick, director of Government Affairs, ASIA, pp. 45-46; and testimony of P. Miller, president, ASIA, pp. 73-74.

Given such wide ranges of debate, an empirical approach which utilizes data-based evidence to suggest not only whether such relationships hold, but also the degree to which they hold, is desirable. Consequently, a modelling approach based on vector autoregression (VAR) econometrics was chosen. VAR econometrics loosely imposes theory with as few a priori (theoretical) restrictions as possible so as to permit the regularities embedded in the data to reveal themselves.⁹⁴ These regularities are history's average interrelationships among these variables, and provide evidence on if and how the individually modelled variables react to a shock in one of the variables. A VAR model posits each of the above six endogenous variables as a function of a specified number of lags (here two) of all six variables. Hence a system of six endogenous variables results, where each variable interacts with the others through lags.⁹⁵ Additionally, each equation contains the following exogenous variables: constant (or intercept), a time trend, and two lags of an animal inventory variable relating the number of sheep and lambs on farms on January 1 of each year.⁹⁶ The estimated VAR model provides a reduced form framework for the six U.S. lamb-market-related variables defined above.⁹⁷

The VAR model was estimated over the 1961-94 period. Statistical evidence strongly indicates that the resulting model is a well-specified one, based on a battery of diagnostic testing standards established in the econometric literature. Specific details on model estimation, choice of lag structure, and the model's diagnostics and empirical validation are provided in appendix L.

Model Simulations and Results

The data-oriented VAR model provides the average dynamic patterns with which the six variables have historically reacted to movements in each other. Such dynamics provide insights concerning the nature of the modelled system's competitive conditions. More specifically, Commission staff conducted five different model simulations:

Simulation 1: Positive shock (increase) in U.S. lamb imports and the nature and degree of responses in (a) U.S. lamb price, (b) equilibrium domestic meat quantity, (c) U.S. wool production, and (d) U.S. wool price.

⁹⁴ For a detailed description of vector autoregression econometric methods, see D.A. Bessler, "Analysis of Dynamic Economic Relationships: An Application to the U.S. Hog Market," *Canadian Journal of Agricultural Economics*, vol. 32 (1984), pp. 109-24.

⁹⁵ See C. Sims, "Macroeconomics and Reality," *Econometrica*, vol. 48, No. 1 (1980), pp. 1-48. See also Bessler, "Dynamic Economic Relationships."

⁹⁶ These data are in 1,000 head and were published by the U.S. Department of Agriculture in two publications: the 1958-69 data are from *Livestock and Meat Statistics* (Statistical Bulletins 522 and 784); data from 1970 and on are from *Red Meat Year Book*, 1994, (Statistical Bulletin 885).

⁹⁷ J. Hamilton, *Time Series Analysis*, pp. 324-27. Hamilton provides a discussion on the relationship of reduced-form VAR models and more theoretically based structural econometric models.

Simulation 2: Positive shock (increase) in the equilibrium lamb meat quantity slaughtered and consumed, and the nature and degree of responses in (a) U.S. lamb price, (b) U.S. wool production, (c) U.S. wool price, and (d) U.S. lamb imports.

Simulation 3: Positive shock (increase) in U.S. lamb price and the nature and degree of responses in (a) equilibrium domestic meat quantity, (b) U.S. wool production, (c) U.S. wool price, and (d) U.S. lamb imports.

Simulation 4: Elimination of the Wool Act, emulated by a decline in RATIO, the effective rate of wool return over and above the market price wool price, and the nature and degree of responses in (a) U.S. lamb price, (b) equilibrium meat quantity, (c) U.S. wool price, and (d) U.S. lamb imports.

Simulation 5: Elimination of the Wool Act, emulated by a decline in RATIO, and the nature and degree of responses in (a) U.S. lamb price, (b) equilibrium meat quantity, and (c) U.S. lamb imports. For reasons provided below, this simulation uses a slightly altered model from that of simulation 4.

The estimated VAR model was simulated under the five simulations above using the impulse response function, and multipliers can be calculated from each simulation's statistically nonzero impulse responses.⁹⁸ The multipliers, provided in table 5-8, indicate the model's percentage change in the response variable per percentage change in the shock variable. Sign is important: a positive multiplier suggests that each percentage change in the shock variable has generally coincided with response variable changes in the same direction, while a negative multiplier suggests that each shock variable change has generally coincided with response variable changes in the opposing direction. For example, each percent increase in U.S. lamb price (simulation 3) has, on average historically, elicited a 0.38 percent drop in the equilibrium quantity of meat slaughtered and consumed.

Simulation 1: Effect of Increased Imports

The results in table 5-8 indicate that, on average historically, each percent rise in U.S. lamb imports displaced some domestic lamb quantities, although such displacement was slight (one twentieth of a percent), and apparently insufficient to influence U.S. lamb price. This result falls within the spectrum of debate formed by testimony of the foreign producer

⁹⁸ Not much attention is paid to RATIO as a response variable in simulations 1-3. This is because over the 34-year estimation period of 1961-1994, the support price has generally increased, although erratically, from \$0.62/lb to \$2.09/lb. Hence, an increase (decrease) in the wool market price translates into a somewhat more pronounced RATIO decrease (increase) rather transparently. See USDA, ASCS, "Commodity Fact Sheet, Wool, 1993."

Table 5-8
Multipliers for U.S. sheep-related markets under five simulations¹

	Simulation 1, increased lamb imports	Simulation 2, increased meat quantity ²	Simulation 3, increased lamb price	Simulation 4, Wool Act's elimination ³	Simulation 5, Wool Act's elimination ³
U.S. lamb price	N/S	-1.43	N/R	-0.14	N/S
Meat slaughtered, consumed	-.05	N/R	-.38	.07	.05
U.S. wool production	N/S	.27	-.20	N/S	N/S
U.S. wool price	N/S	-2.9	1.6	-0.95	N/R
U.S. lamb imports	N/R	-2.6	N/S	N/S	N/S
RATIO	N/S	3.3	-1.8	N/R	N/R

¹ The "N/S" and "N/R" labels denote situations where responses were statistically insignificant (at the 10-percent significance level) and/or not relevant to the simulation.

² "Meat quantity" here refers to the U.S. equilibrium quantity of sheep and lamb meat slaughtered and consumed, also denoted as "meat slaughtered and consumed" above. This variable is defined in the text.

³ For reasons explained in the text, simulations 4 and 5 were driven by slightly different models.

Source: Simulation results of Commission staff's econometric model.

interests,⁹⁹ who testified that lamb imports are sufficiently different from U.S. domestic lamb so as not to displace the U.S. quantities or depress U.S. lamb price, and of the domestic producers,¹⁰⁰ who testified that lamb imports are sufficiently similar to domestic lamb quantities, so as to displace the U.S.-produced quantities and suppress U.S. lamb price. These first simulation results are consistent with recent Commission findings that certain subsidized lamb imports have had mild adverse effects of less than a percent on U.S. lamb meat output, price, and revenue.¹⁰¹

Simulations 2 and 3: Market effects of changes in U.S. quantity and price

Results from simulations 2 (column 2) and 3 (column 3) suggest that changes in U.S. lamb price and in the level of domestic lamb slaughtered and consumed, and not changes in import levels, tend to be the most important factors in U.S. lamb-related markets. On average historically, each percent rise in the quantity of U.S. lamb meat slaughtered and consumed has coincided with a 1.4-percent drop in price; a 0.27-percent increase in wool production as more slaughter-slanted lambs are shorn; and a 2.9-percent decline in wool price. Each percent increase in U.S. lamb price has coincided with, on

¹⁰⁰ See transcripts of the Commission's hearing on investigation No. 332-357, Apr. 6, 1995, testimony of P. Miller, president, ASIA, at pp. 38-39. See also the posthearing brief submitted to Commission investigation No. 332-357 on behalf of ASIA, Apr. 24, 1995, at pp. 3-7, 8-9, and 12-15.

¹⁰¹ USITC publication 2900, chapter 8: Lamb Meat, p. 8-28 through 8-29.

average historically, a 0.38-percent decrease in U.S. lamb meat slaughtered and consumed, as consumers demand less of the more highly priced lamb and as producers save ewe lambs for breeding purposes. This switch toward meat-producing animals may account for the result that each percent rise in lamb price results in a 0.2-percent fall in wool production and in a rise in the market price of U.S. wool.

Simulations 4 and 5: Elimination of Wool Act benefits

Two simulations (4 and 5 in columns 4 and 5, respectively) were used to analyze the probable impacts on the U.S. sheep-related industry of eliminating Wool Act benefits, the accrual of which will end in calendar year 1995. An analytical limitation of using economic models to analyze such a change in "regime" as elimination of Wool Act benefits, which have been in effect since the 1950s, is encountered: econometric models estimated with past data or economic models based on parameters estimated from past data, when the Wool Act was in effect, are used to characterize conditions of the new "regime" of markets without the Wool Act. One cannot know the true nature of these future market conditions without Wool Act benefits because the new regime has not yet occurred. Because of this limitation, two alternative VAR models were estimated and simulated. Simulations 4 and 5 both imposed a decline in RATIO, the ratio of the support price over the U.S. market wool price, on a model, although the models used differed slightly.

As pointed out by Whipple and Menkhaus,¹⁰² there are two rates of wool producer returns under the Wool Act: the wool market price and the level of Federal support over and above the market price represented by the ratio of the support price over the market wool price or RATIO.¹⁰³ Under the new regime without Wool Act benefits, the current ratio of the higher support price over the lower market price would likely reduce to unity, as Federal support levels over and above the market price falls to zero. For the first year or two after Wool Act's elimination, it is likely that producers, as they have for the last four decades, would look at the market price in terms of RATIO, as the effective return to wool production falls from above unity to equal unity as benefits terminate. A unity RATIO would suggest no level of Government support over and above market price. Simulation 4 uses the same model of Wool Act conditions used in simulations 1-3. Simulation 5 uses the above-specified model (used in simulations 1-4) which was re-estimated without the wool market price, and with RATIO included, to obtain a model of future conditions without the Wool Act. So while simulation 4 uses the old-regime

¹⁰² See Whipple and Menkhaus, "Wool Act."

¹⁰³ The wool support price exceeded the wool market price during all years since the 1960 except during 1979. Further, the support price was modeled as an endogenous variable because Federal Government behavior in determining the support price, and hence incentive payments, has been endogenous. The wool support price annually changed 23 times during the 34 years ending 1994. Having sometimes increased and decreased, the per-pound support price generally trended upward from \$1.23 to \$2.09 during 1980-94. See USDA, ASCS, "Commodity Fact Sheet, Wool, 1993."

data and a model of Wool Act conditions to characterize the new regime, simulation 5 uses old-regime data to reestimate the model for the new regime. At this point in time, one does not know which approach is more accurate, as conditions without Wool Act benefits have yet to occur.

Simulation 4 suggests that each percent decline in RATIO would coincide with a 0.07 percent fall in U.S. domestic quantity, and a 0.14 percent rise in U.S. lamb price, and a 0.95 percent rise in wool price, perhaps as the marginally profitable farmers leave the now less-profitable industry without Wool Act benefits. Simulation 5's results suggest that each percent drop in RATIO would coincide with a lesser 0.05 percent drop in U.S. quantity, with no other effects. Both the simulations generate similarly mild declines in lamb meat production.

Findings From Combined Simulation Results

Simulations 1, 2, and 3 suggest that increases in domestic lamb quantity displace imports to a far greater degree than increases in imports displace domestic quantities. This may indicate that the U.S. market prefers the primarily fresh and larger-cut domestic lamb over the primarily frozen and smaller-cut imported lamb. These results suggest that U.S. quantity increases can decrease imports; that increased imports have done little to U.S. price or quantity; and that promoting increased U.S. lamb production and consumption may be an effective deterrent to imports. According to the model (of scenarios 1-4), suppressing imports would do little to support U.S. lamb price or bolster domestic quantities of lamb slaughtered and consumed.

Simulations 4 and 5 suggest that elimination of the Wool Act benefits may result in reductions in U.S. domestic wool production, along with mildly higher prices of U.S.-produced wool. The model results suggest that elimination of Wool Act benefits will likely result in some contraction of the U.S. industry, as U.S. lamb quantities fall, and U.S. lamb price increases, as some producers exit the industry. The multipliers for quantity response from a change in RATIO are very inelastic (0.07 for simulation 4 and 0.5 for simulation 5), suggesting mild reductions. Perhaps the quantity responses are not more pronounced because of the limited opportunities U.S. sheep farmers have, in such areas as the Southwest, to switch to such other lines of livestock production as beef or pork production.¹⁰⁴

¹⁰⁴ In response to Commission cross examination, Pierce Miller, president, ASIA, noted that such sheep farmers cannot easily switch to other kinds of livestock production because of terrain and climatic conditions that are not amenable to production of other livestock such as cattle. See transcripts of the Commission hearing 332-357, Apr. 6, 1995, at pp. 52-54.

THE UNITED STATES TRADE REPRESENTATIVE
Executive Office of the President
Washington, D.C. 20506

DOCKET
NUMBER

1838

OCT 06 1994

Office of the
Secretary

RECEIVED Int'l Trade Commission

OFFICE OF THE SECRETARY
U.S. INTERNATIONAL TRADE COMMISSION

The Honorable Peter Watson
Chairman
U.S. International Trade Commission
500 E Street, SW
Washington, DC 20436

Dear Chairman Watson:

'94 OCT 12 P1:54

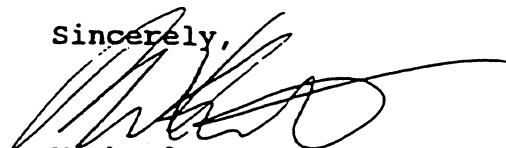

The current conditions of competition in the U.S. market for lamb are a matter of concern for the domestic industry. The Administration shares the industry's concerns and is considering how best to address them.

I therefore request, pursuant to section 332 of the Tariff Act of 1930 and the authority delegated by Executive Order 12661, that the U.S. International Trade Commission investigate the competitive conditions affecting the U.S. lamb industry and provide a report setting forth the results of that investigation. In its report, I request that the Commission provide, to the extent practicable, the following: U.S. and foreign industry profiles; with respect to Australia and New Zealand, such information as the Commission develops concerning whether there is government assistance to the industries in those countries, without regard to whether that assistance may constitute a subsidy under U.S. countervailing duty law; information concerning U.S. and foreign markets, U.S. imports and exports, and U.S. market penetration; price comparisons of domestic and imported lamb meat; and any other information relating to competitive factors that affect the U.S. lamb industry. The report should focus on the period 1991-94 and be similar in structure to the last Commission 332 report on lamb: *U.S. Imports of Lamb Meat: Final Monitoring Report* (USITC Publication 2345, December 1990).

It is requested that the Commission hold a public hearing for interested parties during the course of the investigation. The Commission should transmit its report at the earliest possible date, but no later than ten months following receipt of this request. It is the intent of this office to make the Commission's report available to the public in its entirety. Therefore, the report should not contain any confidential business information.

The Commission's assistance in this matter is greatly appreciated.

Sincerely,

Michael Kantor

APPENDIX B
NOTICE OF INSTITUTION OF
INVESTIGATION NO. 332-357,
HEARING, AND RESCHEDULING OF
THE HEARING

207.23(b) of the Commission's rules. Parties are strongly encouraged to submit as early in the investigation as possible any requests to present a portion of their hearing testimony *in camera*.

Written submissions.—Each party is encouraged to submit a prehearing brief to the Commission. Prehearing briefs must conform with the provisions of section 207.22 of the Commission's rules; the deadline for filing is January 4, 1995. Parties may also file written testimony in connection with their presentation at the hearing, as provided in section 207.23(b) of the Commission's rules, and posthearing briefs, which must conform with the provisions of section 207.24 of the Commission's rules. The deadline for filing posthearing briefs is January 19, 1995; witness testimony must be filed no later than three (3) days before the hearing. In addition, any person who has not entered an appearance as a party to the investigation may submit a written statement of information pertinent to the subject of the investigation on or before January 19, 1995. All written submissions must conform with the provisions of section 201.8 of the Commission's rules; any submissions that contain BPI must also conform with the requirements of sections 201.6, 207.3, and 207.7 of the Commission's rules.

In accordance with sections 201.16(c) and 207.3 of the rules, each document filed by a party to the investigation must be served on all other parties to the investigation (as identified by either the public or BPI service list), and a certificate of service must be timely filed. The Secretary will not accept a document for filing without a certificate of service.

Authority: This investigation is being conducted under authority of the Tariff Act of 1930, title VII. This notice is published pursuant to section 207.20 of the Commission's rules.

By order of the Commission.

Issued: November 2, 1994.

Donna E. Koehnke,
Secretary.

BILLING CODE 7020-02-P

[Investigation No. 337-TA-349]

In the Matter of: Certain Diltiazem Hydrochloride and Diltiazem Preparations; Decision Not To Review an Initial Determination Granting Partial Summary Determination of Patent Non-Infringement

AGENCY: International Trade Commission.

ACTION: Notice.

SUMMARY: Notice is hereby given that the U.S. International Trade Commission has determined not to review an initial determination (ID) (Order No. 41) issued on September 29, 1994, by the presiding administrative law judge (ALJ) in the above-captioned investigation granting partial summary determination of patent non-infringement.

FOR FURTHER INFORMATION CONTACT: Mark D. Kelly, Esq., Office of the General Counsel, U.S. International Trade Commission, 500 E Street, S.W., Washington, D.C. 20436, telephone 202-205-3106.

SUPPLEMENTARY INFORMATION: The Commission instituted this investigation, which concerns allegations of violations of section 337 of the Tariff Act of 1930 in the importation, sale for importation, and sale after importation of certain diltiazem hydrochloride and diltiazem preparations, on March 25, 1993. Complainants Marion Merrell Dow, Inc. and Tanabe Seiyaku Co., Ltd. allege the importation and sale of diltiazem hydrochloride and diltiazem preparations manufactured abroad by a process covered by claim 1 of U.S. Letters Patent 4,438,035 (the '035 patent). The notice of investigation named nine respondents: Profarmaco Nobel SRL ("Profarmaco"), Mylan Pharmaceuticals, Inc., Mylan Laboratories, Inc. (collectively, "Mylan"), Gyma Laboratories of America, Inc. ("Gyma"), Abic Ltd., Orion Corporation, Copley Pharmaceuticals, Inc., Interchem Corporation, and Rhone-Poulenc Rorer, Inc. 58 FR 16846, March 31, 1993. Plantex USA, Inc. was subsequently added as a respondent. 58 FR 34063, June 23, 1993.

On November 5, 1993, respondents Mylan and Profarmaco filed a motion for partial summary determination of non-infringement that Profarmaco's "alternative process" does not infringe claim 1 of the '035 patent. Respondent Gyma subsequently filed its own motion for partial summary determination on the same grounds alleged by Mylan/Profarmaco. On September 29, 1994, the

presiding ALJ issued an ID (Order No. 41) granting respondents' motions for partial summary determination of non-infringement.

Complainants filed a petition for review of the ID on October 7, 1994. Respondents Mylan/Profarmaco and Gyma and the Commission investigative attorneys filed responses in opposition to the petition for review.

This action is taken under the authority of section 337 of the Tariff Act of 1930, 19 U.S.C. 1337, and § 210.53 of the Commission's Interim Rules of Practice and Procedure, 19 CFR 210.53. No agency comments on the ID were received.

Copies of the nonconfidential version of the ID and all other nonconfidential documents filed in connection with this investigation are or will be available for inspection during official business hours (8:45 a.m. to 5:15 p.m.) in the Office of the Secretary, U.S. International Trade Commission, 500 E Street S.W., Washington, D.C. 20436, telephone 202-205-2000. Hearing-impaired persons are advised that information on this matter can be obtained by contacting the Commission's TDD terminal on 202-205-1810.

By order of the Commission.

Issued: November 1, 1994.

Donna E. Koehnke,
Secretary.

BILLING CODE 7020-02-P

[Investigation 332-357]

Lamb Meat: Competitive Conditions Affecting the U.S. and Foreign Lamb Industries

AGENCY: International Trade Commission.

ACTION: Institution of investigation and scheduling of public hearing.

SUMMARY: Following receipt of a request on October 12, 1994, from the United States Trade Representative (USTR), the Commission instituted investigation No. 332-357, Lamb Meat: Competitive Conditions Affecting the U.S. and Foreign Lamb Industries, under section 332(g) of the Tariff Act of 1930 (19 U.S.C. 1332(g)) for the purpose of investigating the competitive conditions affecting the U.S. lamb industry.

EFFECTIVE DATE: October 31, 1994.

FOR FURTHER INFORMATION: Information on industry sectors may be obtained from Rose Steller, Office of Industries (202-205-3323) or David Ludwick, Office of Industries (202-205-3329); economic aspects, from Ronald Babula,

Office of Industries (202-205-3331); and legal aspects, from William Gearhart, Office of the General Counsel (202-205-3091). The media should contact Margaret O'Laughlin, Office of Public Affairs (202-205-1819). Hearing impaired individuals are advised that information on this matter can be obtained by contacting the TDD terminal on (202-205-1810).

Background: As requested by the USTR, the Commission in its report will provide, to the extent practicable, the following:

- (1) U.S. and foreign industry profiles;
- (2) With respect to Australia and New Zealand, such information as the Commission develops concerning whether there is government assistance to the industries in those countries without regard to whether that assistance may constitute a subsidy under U.S. countervailing duty law;
- (3) Information concerning U.S. and foreign markets, U.S. imports and exports, and U.S. market penetration;
- (4) Price comparisons of domestic and imported lamb meat; and
- (5) Any other information relating to competitive factors that affect the U.S. lamb industry.

As requested, the report will focus on the period 1991-94 and be similar in structure to the last Commission section 332 report on lamb: U.S. Imports of Lamb Meat: Final Monitoring Report (Inv. no. 332-264, USITC Publication 2345, December 1990). The Commission's report will be submitted to the USTR at the earliest possible date, but no later than August 14, 1995.

Public Hearing: A public hearing in connection with the investigation will be held at the U.S. International Trade Commission Building, 500 E Street SW, Washington, DC, beginning at 9:30 a.m. on February 23, 1995. All persons will have the right to appear, by counsel or in person, to present information and to be heard. Requests to appear at the public hearing should be filed with the Secretary, United States International Trade Commission, 500 E Street SW, Washington, DC 20436, no later than 5:15 p.m. February 9, 1995. Any prehearing briefs (original and 14 copies) should be filed not later than 5:15 p.m. February 13, 1995; the deadline for filing post-hearing briefs or statements is 5:15 p.m. March 9, 1995.

Written Submissions: In lieu of or in addition to participating in the hearing, interested parties are invited to submit written statements concerning the matters to be addressed by the Commission in its report on this investigation. Commercial or financial information that a submitter desires the Commission to treat as confidential must be submitted on separate sheets of

paper, each clearly marked "Confidential Business Information" at the top. All submissions requesting confidential treatment must conform with the requirements of § 201.6 of the Commission's *Rules of Practice and Procedure* (19 CFR 201.6). All written submissions, except for confidential business information, will be made available in the Office of the Secretary to the Commission for inspection by interested parties. To be assured of consideration by the Commission, written statements relating to the Commission's report should be submitted to the Commission at the earliest practical date and should be received no later than the close of business on March 9, 1995. All submissions should be addressed to the Secretary, United States International Trade Commission, 500 E Street SW, Washington, DC 20436.

Persons with mobility impairments who will need special assistance in gaining access to the Commission should contact the Office of the Secretary at 202-205-2000.

By order of the Commission.

Issued: November 1, 1994.

Donna R. Koehnke,
Secretary.

BILLING CODE 7020-02-P

[Investigation No. 337-TA-366]

Certain Microsphere Adhesives, Process for Making Same, and Products Containing Same, Including Self-Stick Repositionable Notes; Notice of Decision Not To Review an Initial Determination Granting a Motion for Summary Determination That the Economic Tests for Establishing a Domestic Industry Are Met

AGENCY: U.S. International Trade Commission.

ACTION: Notice.

SUMMARY: Notice is hereby given that the U.S. International Trade Commission has determined not to review an initial determination (ID) (Order No. 9) issued on October 10, 1994, by the presiding administrative law judge (ALJ) in the above-captioned investigation. The ID granted a motion of complainant Minnesota Mining and Manufacturing (3M) for summary determination that the economic tests for establishing a domestic industry in this investigation are met.

FOR FURTHER INFORMATION CONTACT: Tim Yaworski, Esq., Office of the General Counsel, U.S. International Trade Commission, 500 E Street, S.W.,

Washington, D.C. 20436, telephone 202-205-3096.

SUPPLEMENTARY INFORMATION: The Commission instituted this investigation, which concerns allegations of section 337 violations in the importation, the sale for importation, and the sale within the United States after importation of certain microsphere adhesives, and products containing same, including self-stick repositionable notes, said to infringe eight claims of U.S. Letters Patent 4,166,152, on June 8, 1994 (59 FR 29620).

On August 22, 1994, 3M filed a motion that, *inter alia*, requested summary determination that the economic tests for establishing a domestic industry set forth in section 337(a)(3) (19 U.S.C. 1337(a)(3)) are met in this investigation. That request was opposed by the respondents to the investigation and supported by the Commission investigative attorney.

On October 10, 1994, the presiding ALJ issued an ID granting summary determination that the economic tests for establishing a domestic industry are met. There were no petitions for review of the ID and no agency comments were filed.

This action is taken under the authority of section 337 of the Tariff Act of 1930, 19 U.S.C. 1337, and Commission interim rule 210.53, 19 C.F.R. 210.53.

Copies of the ID and all other nonconfidential documents filed in connection with this investigation are or will be available for inspection during official business hours (8:45 a.m. to 5:15 p.m.) in the Office of the Secretary, U.S. International Trade Commission, 500 E Street, S.W., Washington, D.C. 20436, telephone 202-205-2000. Hearing-impaired persons are advised that information on this matter can be obtained by contacting the Commission's TDD terminal on 202-205-1810.

Issued: November 1, 1994.

By order of the Commission.

INTERNATIONAL TRADE COMMISSION

[Investigation 332-357]

Lamb Meat: Competitive Conditions Affecting the U.S. and Foreign Lamb Industries

AGENCY: United States International Trade Commission.

ACTION: Rescheduling of public hearing.

EFFECTIVE DATE: February 13, 1995.

SUMMARY: The public hearing on this matter, scheduled for February 23, 1995, has been rescheduled to April 6, 1995. The public hearing will be held at the U.S. International Trade Commission Building, 500 E Street SW., Washington, DC, beginning at 9:30 a.m. on April 6, 1995. All persons will have the right to appear, by counsel or in person, to present information and to be heard. Requests to appear at the public hearing should be filed with the Secretary, United States International Trade Commission, 500 E Street SW., Washington, DC 20436, no later than 5:15 p.m., March 23, 1995. Any prehearing briefs (original and 14 copies) should be filed not later than 5:15 p.m., March 29, 1995; the deadline for filing post-hearing briefs or statements is 5:15 p.m., April 24, 1995. Notice of institution of the investigation and an earlier scheduled hearing date were published in the *Federal Register* of November 9, 1994 (59 FR 55855). In the event that, as of the close of business on March 23, 1995, no witnesses are scheduled to appear at the hearing, the hearing will be cancelled. Any person interested in attending the hearing as an observer or non-participant may call the Secretary of the Commission (202-205-2000) after March 23, 1995, to determine whether the hearing will be held.

FOR FURTHER INFORMATION CONTACT: Information on industry sectors may be obtained from Rose Steller, Office of Industries (202-205-3323) or David Ludwick, Office of Industries (202-205-3329); economic aspects, from Ronald Babula, Office of Industries (202-205-3331); and legal aspects, from William Gearhart, Office of the General Counsel (202-205-3091). The media should contact Margaret O'Laughlin, Office of Public Affairs (202-205-1819). Hearing impaired individuals are advised that information on this matter can be

obtained by contacting the TDD terminal on (202-205-1810).

Background

Following the receipt of a request on October 12, 1994, from the United States Trade Representative (USTR), the Commission instituted investigation No. 332-357, Lamb Meat: Competitive Conditions Affecting the U.S. and Foreign Lamb Industries, under section 332(g) of the Tariff Act of 1930 (19 U.S.C. 1332(g)) for the purpose of investigating the competitive conditions affecting the U.S. lamb industry. The Commission plans to submit its report by August 14, 1995.

Written Submissions

As provided for in the Commission's prior notice, in lieu of or in addition to participating in the hearing, interested parties are invited to submit written statements concerning the matters to be addressed by the Commission in its report on this investigation. Commercial or financial information that a submitter desires the Commission to treat as confidential must be submitted on separate sheets of paper, each clearly marked "Confidential Business Information" at the top. All submissions requesting confidential treatment must conform with the requirements of § 201.6 of the Commission's Rules of Practice and Procedure (19 CFR 201.6). All written submissions, except for confidential business information, will be made available in the Office of the Secretary of the Commission for inspection by interested parties. To be assured of consideration by the Commission, written statements relating to the Commission's report should be submitted to the Commission at the earliest practical date and should be received no later than the close of business on April 24, 1995. All submissions should be addressed to the Secretary, United States International Trade Commission, 500 E Street SW., Washington, DC 20436.

Persons with mobility impairments who will need special assistance in gaining access to the Commission should contact the Office of the Secretary at 202-205-2000.

By order of the Commission.

Issued: February 14, 1995.

Donna R. Koehnke,
 Secretary.

BILLING CODE 7020-02-P

[Investigations Nos. 731-TA-678, 679, 681, and 682 (Final)]

Stainless Steel Bar From Brazil, India, Japan, and Spain

Determinations

On the basis of the record¹ developed in the subject investigations, the Commission determines, pursuant to section 735(b) of the Tariff Act of 1930 (19 U.S.C. § 1673d(b)) (the Act), that an industry in the United States is materially injured by reason of imports from Brazil, India, Japan, and Spain of stainless steel bar,²⁻³ provided for in subheadings 7222.10.00, 7222.20.00, and 7222.30.00 of the Harmonized Tariff Schedule of the United States,⁴ that have been found by the Department of Commerce to be sold in the United States at less than fair value (LTFV).

Background

The Commission instituted these investigations effective August 4, 1994, following preliminary determinations by the Department of Commerce that imports of stainless steel bar from Brazil, India, Japan, and Spain were being sold at LTFV within the meaning of section 733(b) of the Act (19 U.S.C. 1673b(b)). Notice of the institution of

¹ The record is defined in sec. 207.2(f) of the Commission's Rules of Practice and Procedure (19 CFR § 207.2(f)).

² Chairman Watson dissenting.

³ Commissioner Crawford found two like products in these investigations: hot-formed stainless steel bar and cold-finished stainless steel bar. She determines that the domestic industry producing hot-formed stainless steel bar is not materially injured or threatened with material injury by reason of imports from all subject countries. She determines that the domestic industry producing cold-finished stainless steel bar is materially injured by reason of subject imports from Brazil, Japan, and Spain, but is not materially injured or threatened with material injury by reason of subject imports from India.

⁴ The imported stainless steel bar covered by these investigations comprises articles of stainless steel in straight lengths that have been either hot-rolled, forged, turned, cold-drawn, cold-rolled, or otherwise cold-finished, or ground, having a uniform solid cross section along their whole length in the shape of circles, segments of circles, ovals, rectangles (including squares), triangles, hexagons, octagons, or other convex polygons. Except as specified above, the term does not include stainless steel semifinished products, cut-to-length flat-rolled products (i.e., cut-to-length rolled products which if less than 4.75 mm in thickness have a width measuring at least 10 times the thickness, or if 4.75 mm or more in thickness having a width which exceeds 150 mm and measures at least twice the thickness), wire (i.e., cold-formed products in coils, of any uniform solid cross section along their whole length, which do not conform to the definition of flat-rolled products), and angles, shapes, or sections. Stainless steel bar includes cold-finished stainless steel bars that are turned or ground in straight lengths, whether produced from hot-rolled bar or from straightened and cut rod or wire, and reinforcing bars that have indentations, ribs, grooves, or other deformations produced during the rolling process.

APPENDIX D
PRIME (WHOLESALE) CUTS AND
BONE STRUCTURE OF LAMB AND
RETAIL CUTS OF LAMB

Prime (wholesale) cuts and bone structure of lamb

LAMB RETAIL NAMES

There are different ways to break a lamb carcass. It can be divided into sides, with the carcass split through the center of the backbone, or it can be divided into foresaddle (unsplit front half which includes ribs, shoulder, breast and fore shank, and hindsaddle (unsplit rear half which includes loin, flank and legs). This is done by separating between the 12th and 13th ribs.

No one way of breaking lamb is considered the best. However, the cutting method and nomenclature for primal and subprimal lamb

cuts used in this manual are shown in Figure 1. Unless specified otherwise, the foresaddle and hindsaddle are split through the center of the backbone before primal and subprimal cuts are produced.

The unsplit primal rib is also known as the "hotel rack" and contains ribs 6-12.

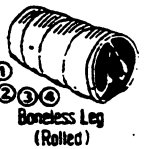

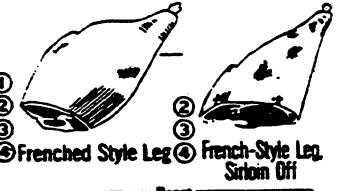

The loin of lamb is comparable to the short loin in beef. It includes the 13th rib to immediately in front of the hip bone.

The leg includes both the sirloin and leg sections

HARMONIZED TARIFF SCHEDULE of the United States (1995)

Annotated for Statistical Reporting Purposes

CHAPTER 1

LIVE ANIMALS

I
1-1

Note

1. This chapter covers all live animals except:
 - (a) Fish and crustaceans, molluscs and other aquatic invertebrates, of heading 0301, 0306 or 0307;
 - (b) Cultures of microorganisms and other products of heading 3002; and
 - (c) Animals of heading 9508.

Additional U.S. Notes

1. The expression "purebred breeding animals" covers only animals certified to the U.S. Customs Service by the Department of Agriculture as being purebred of a recognized breed and duly registered in a book of record recognized by the Secretary of Agriculture for that breed, imported specially for breeding purposes, whether intended to be used by the importer himself or for sale for such purposes.
2. Certain special provisions applying to live animals are in chapter 98.

(a) Averages have been calculated by dividing industry estimates by the estimated number of farm businesses in each industry. (b) Includes an estimate for the value of the increase in livestock. (c) Excludes an estimate for the value of the increase in livestock. (d) Prior to 1991-92 the estimates for Cotton were included in the estimates for Other agriculture.

NOTE: Standard error of change between two years is 1.3 times the standard error of the estimate (except for the All Industries estimate where it is equal to the standard error of the estimate). (Refer to Paragraphs 12.19 of the Explanatory Notes).

APPENDIX J
THE FORMAL PRIORITY STATEMENT
DIRECTED TO THE FOUNDATION FOR
RESEARCH, SCIENCE AND
TECHNOLOGY

APPENDIX 1: THE FORMAL PRIORITY STATEMENT DIRECTED TO THE FOUNDATION FOR RESEARCH, SCIENCE AND TECHNOLOGY

The Chairman
The Foundation for Research, Science and Technology
P O Box 12 240
WELLINGTON

Dear Professor Axford

STATEMENT OF SCIENCE PRIORITIES: 1993/94 TO 1997/98

I am required under the Foundation for Research, Science and Technology Act 1990 to ".... advise the Foundation of the priorities that the Foundation shall adhere to in carrying out its functions..." in the allocation of funds for the production of public good science outputs.

I am conveying this advice to you by means of this letter and Annexes A to H.

I note this statement is the first to present long-term priorities, and is to provide a basis for the allocation of the Public Good Science Fund (PGSF) for the financial years 1993/94 through to 1997/98. While the statement covers this entire period, it may be supplemented or modified if circumstances warrant, and is intended to be comprehensively reviewed in approximately 3 years time.

Strategic Goals for New Zealand Science

The Government believes that decisions on the funding of public good science need to be made in the context of clearly defined strategic goals. These goals need to express the Government's position on the overall strategic direction for research, science and technology, future funding levels, partnership with the private sector, the balance of research and development effort, the necessity for a concentration of resources and the need to add value. The Foundation is thus to apply the strategic goals set out in Annex A in making funding allocations from the Public Good Science Fund.

Allocation of Funds

That part of the PGSF allocated by the Foundation (i.e. excluding non-specific output funding) has been divided into 15 groupings containing combinations of 39 of the 40 output classes of the PGSF (output class 37: Health excluded).

Annex B lists the 15 groupings and shows the funding targets for each grouping and for outputs within each grouping where these are specified, for the 1997/98 financial year. In particular for the Infrastructure (output classes 19, 20, 21, 22, 23, 24) and Protection and Assessment of the Earth (output classes 29, 30, 31, 32, 33) groupings, the funding levels as

identified in Annex B for each output class, should be used as targets.

The Foundation is to manage the allocation of funding so that these targets can be achieved.

Discretion in the Transition over the Five Year Period

The Foundation will be allowed some discretion in the allocation of funding to output classes and groupings of output classes within the 5 year period, i.e. on an annual basis. However, the Foundation is to develop an overall funding transition strategy and to advise me of the strategy by September 1993. Further details are contained in Annex D.

Development of Science Area Research Strategies

The Foundation is to develop science area research strategies as a primary means of managing the allocation of funding over the 5 year period so as to achieve the target funding levels in the most effective and productive way. Strategies are to be developed through a process of widespread consultation with science providers, users of research in each science area and the associated sector.

A key consideration in developing science area research strategies should be the impact of funding from other sources, especially the private sector.

Science area research strategies should be formally advised to me, as they become available and no later than September 1993, to ensure that the implications of funding changes in particular are well understood and can be effectively managed.

Specific requirements for science area research strategies are set out in Annex E.

Priority Research Themes

Priority research themes, as set out in Annex F, are to be considered by the Foundation in making funding allocations. Programmes relevant to priority research themes should be given priority consideration for funding, but this is not to be at the expense of maintaining a reasonable balance of relevant research across the PGSF. Relevance to a priority research theme should not override quality criteria.

Themes have been developed at three levels:

- generic themes across a large number of output classes;
- cross-output themes; and
- specific output themes.

As and when science area research strategies are developed, the Government may agree to modify themes or to concur with their incorporation into the science area research strategies.

National Science Strategies

I wish to draw to the Foundation's attention two cross-output topic themes of particular importance to Government. These relate first to climate change and secondly to the control of possums and the threat of bovine tuberculosis.

These cross-output themes are the subject of National Science Strategies (NSS) which have been developed and will continue to be developed by Committees which I have appointed for this purpose. The Foundation is to take account of the strategies produced by the National Science Strategy Committees, when selecting programmes for funding.

The Foundation is also to ensure that research in the NSS on possums and bovine tuberculosis should have separately identifiable and costed components either within research programmes or as separate programmes, and that research in any other NSS topic areas should be clearly and separately costed.

The Foundation is to report its expenditure on NSS-related programmes after each funding round.

Long-Term Programme Funding

I wish to emphasise the Government's recognition of the long term nature of science and the necessity to fund appropriate programmes on a longer term basis. The guidelines which the Foundation is to follow in this respect are set out in Annex G, part 1.

Databases, Curations and Collections

The Government considers that funding allocations should recognise the need to maintain and efficiently utilise science assets of national importance. The guidelines which the Foundation is to follow in this respect are set out in Annex G, part 2.

International Collaboration

Science is becoming increasingly international in character, reflecting the increasing globalisation of economic activity, environmental and social issues, and the impact of communication and other new technologies. Internationalisation is recognised by the science community as a critically important factor. The guidelines which the Foundation is to follow in this respect are set out in Annex G, part 3.

Information and Technology Transfer

I consider the transfer of information and technology derived from the research and development funded through the Public Good Science Fund to be an important consideration. It is only through the effective transfer, adoption and exploitation of the results of research and development that the outcomes desired by Government for New Zealand can be achieved.

The method the Foundation is to apply to the treatment of information and technology transfer is set out in Annex G, part 4. However, the decisions on information and technology transfer should be applied on a case by case basis by the Foundation without quantitative funding guidelines.

Types of Research

It is important that the Foundation identifies and considers the balance of research effort directed to fundamental, strategic and applied research and experimental development.

Accordingly the Foundation is to identify and monitor the breakdown between fundamental, strategic and applied research, and experimental development in each output class. Desirable shifts in this balance should be considered in applying the strategic goals specified in Annex A and in developing science area research strategies. The principles and definitions of these types of research and development activity are set out in Annex G, part 5.

Criteria for the Selection of Research Proposals

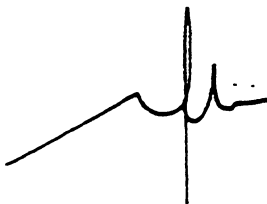

The selection of programmes must show a balance between the strategic importance of the research and its scientific quality. To achieve this, The Foundation is to apply the selection criteria set out in Annex H. The Foundation may apply additional criteria of its own which do not conflict with those in Annex H and which are in accordance with the requirements of the Foundation for Research, Science and Technology Act.

Reporting

Notwithstanding that funding targets have been set in some cases by aggregations of outputs, the Foundation is to report after each funding round on the funding it has allocated within each of the 40 output classes.

Please ensure that this statement of science priorities and any subsequent science area research strategies are conveyed to potential research programme proposers so that the Governments science priorities are given maximum effect in each funding round.

Yours sincerely

A handwritten signature in black ink, appearing to read 'Simon Upton', with a vertical line extending downwards from the end of the signature.

Simon Upton
Minister of Research, Science
and Technology

Note.—Sources are specified in Chapter 5 of the report. "RATIO" is formed by dividing the U.S. wool support price by the prices of U.S.-produced wool.

APPENDIX L
TECHNICAL MODELLING APPENDIX

Vector Autoregression Econometrics and the Competitive Conditions of Lamb-Related Markets

As part of the task of investigating the competitive conditions affecting the U.S. lamb industry, the USITC is requested to provide information on U.S. and foreign lamb-related markets, U.S. imports and exports, and other information concerning competitive conditions related to the lamb industry. An econometric model of U.S. lamb-related markets aids the Commission and Commission staff to accomplish these tasks.

For reasons discussed in the report, Commission staff applied a data-oriented method called vector autoregression (VAR) econometrics, which loosely imposes theory with as few a priori (theoretical) restrictions as possible so as to permit the regularities embedded in data on the following U.S. lamb-related factors to reveal themselves: U.S. domestically-produced lamb and sheep meat slaughtered and consumed, wool production, market prices for lamb and wool, and the ratio of the wool support price to market wool prices.¹ These regularities are history's average interrelationships among these variables, and provide evidence on if, and how, the individually modeled variables react to a shock in one of the variables.

A VAR model is a data-driven one. Using methods detailed below, Commission staff has estimated a VAR model of the following system of annual U.S. lamb-related market variables over the 1961-1994 period:

1. U.S. equilibrium levels of lamb/sheep meat slaughtered and consumed (hereafter equilibrium domestic meat quantity or equilibrium "lamb" meat quantity)²
2. U.S. market price for lamb (hereafter, lamb price)
3. U.S. wool production
4. Ratio of the Wool Act's support price to market wool price (hereafter RATIO)
5. U.S. lamb meat imports (hereafter lamb imports)
6. U.S. market price of wool (hereafter, market wool price)

Equilibrium domestic meat quantity is total U.S. lamb and mutton slaughtered (consumed) in millions of pounds, published by the U.S. Department of Agriculture (USDA).³ The official U.S. Department of Commerce data on imported lamb quantities (millions of pounds) serve as U.S. lamb meat imports. Lamb price is the average price of spring lambs, choice carcasses of either 75-105 or 80-110 pounds, at Sioux Falls, South Dakota, compiled by the USDA's Agricultural Marketing Service (USDA, AMS).⁴

¹ For a detailed description of vector autoregression econometric methods, see D.A. Bessler, "Analysis of Dynamic Economic Relationships: An Application to the U.S. Hog Market," *Canadian Journal of Agricultural Economics*, vol. 32, 1984, pp. 109-24.

² This quantity is hereafter referred to as lamb meat because most of the quantity is lamb meat. In 1994, about 93 percent of sheep-related meat production was lamb meat, and only about 6 percent was mutton. See U.S. Department of Agriculture, National Agricultural Statistics Service, *Livestock Slaughter, 1994 Summary*, publication no. Mt An 1-2-1(95), March 1994, pp. 5, 84.

³ For 1970-93 data, see USDA, Economic Research Service (ERS), *Red Meats Yearbook 1994*, Statistical Bulletin No. 885, table 97, p. 99. For 1958-69 data, see USDA, ERS, *Livestock and Meat Statistics*, relevant supplement issues. The 1994 data were obtained from USDA, ERS, *Cattle and Sheep Situation and Outlook Report*, February 14, 1995.

⁴ These unpublished prices constituted the only consistent U.S. lamb price series located by Commission staff back to the 1950s. The data were obtained from USDA, AMS by private communication with Commission

U.S. wool production is reflected by shorn wool production published by the USDA, Agricultural Stabilization and Conservation Service (USDA, ASCS).⁵ RATIO is the ratio of the wool support price over the market wool price, and serves as a per-unit return to wool production over and above the market price paid by the Federal Government to the producer. The wool support price and the wool price were obtained from USDA, ASCS.⁶

Estimated VAR Model and Adequacy of Specification

By a VAR model's definition, each of the above six endogenous variables was posited a function of a specified number of (here, two) lags of not only itself, but also of each of the remaining endogenous variables. Based on the results of Tiao and Box's likelihood ratio test procedures for lag structure determination, and of Commission staff's market knowledge, a two-lag structure was selected.⁷ Following Bessler's⁸ reasoning then, the estimated VAR model is an annual system of six endogenous variables, where each such variable is permitted to influence all other endogenous variables through lags.

Based on previous Commission findings that U.S. lamb consumption, lamb production, and live inventories of sheep and lambs have been generally declining since World War 2, a time trend was included in each equation, as was a constant (intercept).⁹ Additionally, Commission staff included two lags of the live January 1 inventories of live sheep and lambs on farms in each equation.¹⁰

The above-specified model was appropriately estimated with 1961-94 annual data, using ordinary least squares¹¹ and Doan's¹² estimation package, Regression Analysis of Time Series (RATS). Data of the nonbinary variables were modeled in natural logarithms such that shocks to, and impulse responses in, the logged variables represent approximate proportional changes in the nonlogged variables, and approximate percent changes in the nonlogged variables when multiplied by 100. Evidence at the five percent significance level from Ljung-Box portmanteau tests and augmented Dickey-Fuller tests conducted on the estimated residuals of each of the six VAR model equations suggest that the equations are adequately specified.

staff. Because of shutdowns, and subsequent reopenings, of price-reporting meatpacking plants in the Sioux Falls, SD, area, a price was not reported for 1992, but was reported thereafter for 1993 and 1994. Staff used the 1992 price value of feeder sheep spring lambs, choice and fancy (90-110 pounds) as a 1992 value proxy. Commission staff deemed this number to be the closest substitute for the 1992 value from the price data sheets obtained from USDA, AMS.

⁵ USDA, ASCS published the 1958-93 data in *ASCS Commodity Fact Sheet, Wool, 1993*. The 1994 shorn wool estimate was obtained by Commission staff in a private communication with USDA, ASCS staff.

Harvey¹³ and Granger and Newbold¹⁴ note that a Ljung-Box portmanteau value, calculated for an estimated equation's residuals, tests the null hypothesis that the equation has been adequately specified. The Ljung-Box values, which range from 16.0 to 22 for the six model equations, fall below the critical chi-square value of 25.0, leading to the conclusion that evidence at the five percent significance level is insufficient to reject the null hypotheses that each of the six equations is adequately specified.

Stationarity of the estimated equations, reflected by the stationarity of an equation's residuals, provides another accepted check on whether the estimated equation has been adequately specified. Augmented Dickey-Fuller (ADF) τ_μ and τ_τ tests, as detailed by Engle and Granger¹⁵ and Hamilton,¹⁶ were calculated for the residuals of each of the six equations to test the null hypotheses of both tests that the residuals are not stationary. The six ADF τ_μ and six τ_τ values are all negative, and have absolute values of at least 3.8. That all ADF values are negative, and have absolute values in excess of those of the critical test values (2.89 for the τ_μ tests and 3.45 for the τ_τ tests), suggests that evidence is sufficient to reject the null hypotheses that all six equations are nonstationary. Commission staff therefore concluded that, based on the ADF test results, the equations have been adequately specified.

VAR Model Impulse Response Functions and Model Simulations

Following Hamilton's¹⁷ reasoning, the estimated VAR model provides a reduced-form structure of the six U.S. lamb-market-related variables defined above. As a reduced form model, the equilibrium domestic meat quantity is not quantity supplied or demanded, but rather the equilibrium quantity of lamb/sheep meat slaughtered *and* consumed.

The model provides the average dynamic patterns with which the six variables have historically reacted to movements in each other, and such dynamics provide insights concerning the modeled system's competitive nature. For example, whether imports significantly influence quantities and price of U.S.-produced lamb, whether the equilibrium meat quantity is sensitive or inelastic to lamb price changes, or whether the U.S. sheep-related markets will be affected by eliminating the Wool Act benefits are important facets of the competitive environment that face U.S. producers and consumers.

More specifically, Commission staff conducted the following simulation experiments:

Simulation 1: Positive shock (increase) in U.S. lamb imports and the nature and degree of responses in (a) U.S. lamb price, (b) equilibrium domestic meat quantity, (c) U.S. wool production, and (d) market wool price.

Simulation 2: Positive shock (increase) in the equilibrium lamb meat quantity slaughtered and consumed, and the nature and degree of responses in (a) U.S. lamb price, (b) U.S. wool production, (c) market wool price, and (d) U.S. lamb imports.

Simulation 3: Positive shock (increase) in U.S. lamb price and the nature and degree of responses in (a) equilibrium lamb meat quantity, (b) U.S. wool production, (c) market wool price, and (d) U.S. lamb imports.

¹⁷ J. Hamilton, *Time Series Analysis*, pp. 324-27. Hamilton provides a discussion on the relationship of reduced-form VAR models and more theoretically based structural econometric models.

Simulation 4: Elimination of the Wool Act, emulated by a fall in wool price support (in the form of a decrease in RATIO), and the nature and degree of responses in (a) U.S. lamb price, (b) equilibrium lamb meat quantity, (c) market wool price, and (d) U.S. lamb imports.

Simulation 5: Elimination of the Wool Act emulated by a decline in RATIO, and the nature and degree of responses in (a) U.S. lamb price, (b) equilibrium lamb meat quantity, and (c) U.S. lamb imports. For reasons specified in the report, the model driving this simulation is slightly altered from that of simulation 4.

One aspect of the VAR model of the U.S. lamb-related market variables is the response in the system's variables to each of the shocks cited above. In particular, for example, it is of particular interest to those who wish to ascertain the U.S. market's degree of competitiveness whether changes in U.S. lamb imports will or will not appreciably affect U.S. price or production; whether changes in U.S. lamb price or equilibrium lamb meat quantity will or will not influence U.S. level of wool production and price; or whether elimination of the Federal government's wool price support will or will not influence the lamb-related meat and wool markets. So the impulse response function permits imposition of a change in one of the variables (four such shocks, one per simulation cited above), and an examination of the historically average "nature" (degree and direction) of responses in the remaining (non-shocked) endogenous variables. For example, in simulation 3, an increase in U.S. lamb prices is imposed on the model, and Commission staff then examines how history's average 1961-94 patterns would "handle" this shock in terms of the degree and direction of response in equilibrium lamb meat quantity, U.S. wool production, market wool price, U.S. lamb imports, and RATIO.

Insofar as the variables are modeled in natural logarithms, then shocks to, and impulse responses in, the VAR model's logged variables provide approximate proportional changes in the nonlogged variables. These proportional changes are approximate percent changes when multiplied by 100. An impulse response in one model variable from a shock in another model variable imposed on the VAR model reflects the proportional change in the response variable from levels which would have occurred without the shock.¹⁸ Impulse responses and multipliers indicate the inter-equilibrium adjustments that history has, on average, required to bring the response variable from pre-shock equilibrium levels to post-shock equilibrium levels.¹⁹

The estimated VAR model was simulated under the four simulations above using the impulse response function.²⁰ Since the data were modeled in natural logarithms, then shocks to, and impulse responses in, the modeled variables reflect approximate proportional changes in the non-logged variables. The proportional changes represent approximate percent changes when

¹⁹ Ibid.

²⁰ The six VAR equations may have contemporaneously correlated innovations or residuals. Failure to account for contemporaneously correlated current residuals will provide impulse responses not representative of historical patterns. A Choleski decomposition was imposed on the VAR model for each experiment to orthogonalize the current innovation matrix, such that the variance/covariance matrix was identity in each of the four simulations. The Choleski decompositions resolve the problem of contemporaneous correlation or feedback. Each of the five decompositions requires the imposition of a Wold causal ordering among the current values of the dependent variables, with the shock variable usually placed atop the ordering, providing that theory sanctions such placement. Theory "guides" each ordering. In simulation 1, the ordering is as follows: U.S. lamb imports, meat quantity, U.S. lamb price, U.S. wool production, market wool price, and RATIO. Scenario 2's ordering was: meat quantity, U.S. lamb price, U.S. lamb imports, U.S. wool production, RATIO, and market wool price. Scenario 3's ordering was: U.S. lamb price, U.S. lamb imports, meat quantity, U.S. wool production, RATIO, and market wool price. For scenario 4, the ordering was: RATIO, U.S. wool production, market wool price, domestic quantity, U.S. lamb imports, and U.S. lamb price. For scenario 5, the ordering was: RATIO, U.S. wool production, domestic quantity, U.S. lamb imports, and U.S. lamb price. For detailed discussions of Choleski decompositions, and theory-based Wold causal orderings, for VAR models, see C. Sims, "Macroeconomics and Reality," *Econometrica*, vol. 48, (1980), pp. 1-48. Also, see D.A. Bessler, "Dynamic Economic Relationships," 1984.

multiplied by 100. Using Kloek and VanDijk's²¹ Monte Carlo procedures, Commission staff determined those impulse responses which are statistically nonzero (10 percent significance level) in the four simulations.²²

Multipliers can be calculated from each simulation's statistically nonzero impulse responses.²³ That is, in each simulation, the statistically nonzero responses of the remaining endogenous and "nonshocked" variables are summarized into response multipliers, and these multipliers are summarized in table L-1. Likened to elasticities, the multipliers indicate the model's percentage change in the response variable per percentage change in the shock variable. Sign is important: a positive (negative) multiplier suggests that each percentage change in the shock variable has generally elicited response variable changes in the same (opposing) direction. For example, each percent increase in U.S. lamb price (simulation 3) has, on average historically, elicited a 0.38 percent drop in the equilibrium quantity of meat slaughtered and consumed. The simulation results are presented and analyzed in Chapter 5.

²¹ T. Kloek and H.K. VanDijk, "Bayesian Estimates of Equation System Parameters: An Application of Monte Carlo," *Econometrica*, vol. 46 (1978), pp. 1-20.

²² Data are annual. Statistically nonzero impulses were restricted to the first or second impulse response. Therefore, Commission staff did not present the impulses, since patterns were generally only one impulse, and at most 2 impulses.

Table L-1
Multipliers for U.S. sheep-related markets under four simulations¹

	Simulation 1, increased lamb imports	Simulation 2, increased meat quantity ²	Simulation 3, increased lamb price	Simulation 4, Wool Act's elimination ³	Simulation 5, Wool Act's elimination ³
U.S. lamb price	N/S	-1.43	N/R	-0.14	N/S
Meat slaughtered, consumed	-0.05	N/R	-0.38	.07	.05
U.S. wool production	N/S	.27	-0.20	N/S	N/S
U.S. wool price	N/S	-2.9	1.6	-0.95	N/R
U.S. lamb imports	N/R	-2.6	N/S	N/S	N/S
RATIO	N/S	3.3	-1.8	N/A	N/R

¹ The "N/S" and "N/R" labels denote situations where responses were statistically insignificant (at the 10-percent significance level) and/or not relevant to the simulation.

² "Meat quantity" here refers to the U.S. equilibrium quantity of sheep and lamb meat slaughtered and consumed, also denoted as "meat slaughtered and consumed" above. This variable is defined in the text.

³ For reasons explained in the text, simulations 4 and 5 were driven by slightly different models.
