Competitive Trends in the Market for Structural Steel Shapes and Units

Material Competitiveness

Structural steel shapes and units¹ compete closely with reinforced concrete as the load-bearing, structural material for buildings and bridges. The relative cost competitiveness of the two is site specific and dependent on a variety of factors.² However, structural steel's overall market position has improved because of recent steps taken by steel manufacturers, fabricators, and service centers. Examples of such efforts include the following:

- In the early 1980s, British Steel Corporation launched an intensive marketing and education campaign to increase the use of structural steel in single- and multi-story buildings. Since then, steel usage in structural applications in the UK construction market has roughly doubled, to a 60 percent share. The apparent success of the program has spawned a new £1.3 million (\$830,000) educational effort by a consortium of European steelmakers, professional organizations, universities, and the EC's technical training program, Comett. The initiative, known as the European Steel Design Education Programme (Esdep), seeks to increase the level of steel used in structural applications on the European continent, where steel's current share is 33 percent.

- Certain steel service centers have begun to fill a niche between traditional service centers and fabricators. These centers are investing in expensive, computerized equipment to perform basic fabricating operations, such as cutting, coping and drilling--operations that often require costly layouts if performed manually. Because of limited volumes, small and medium-sized fabricators cannot afford to invest in such equipment. The services not only reduce the fabricators' costs, but also allow them to shorten lead times and increase volumes and productivity.

- In 1986, the American Institute of Steel Construction (AISC)³ adopted the Load and Resistance Factor Design (LRFD) method, a new standard for designing steel-framed buildings. The LRFD method replaces the Allowable Stress Design method, the standard since 1923. Designing with LRFD allows average reductions in material costs of about 15 percent. Code acceptance procedures delayed completion of the first LRFD buildings until mid-1988. The new method also improves the performance of a building by yielding higher load capacities and larger areas between supporting columns.

¹ This discussion is concerned primarily with medium and heavy rolled shapes (any cross-sectional dimension greater than 3 inches) and fabricated units included in American Iron and Steel Institute product categories 4, 38, and 39.

² These factors include, but are not limited to, geographic location and intended use of the structure, prevailing climactic, atmospheric and seismic conditions, price and availability of certain skilled labor, and architectural preferences.

³ AISC is a standards and trade organization comprised of U.S. structural steel fabricators.

● NKK, a major Japanese steel producer, recently introduced a structural steel grade which exhibits improved heat resistance. The new steel can withstand temperatures 100° to 150° Celsius higher than conventional steels while maintaining the same yield strength. Lower overall costs are attained due to savings in post erection fire-proofing requirements. However, building codes, which specify what steel grades are acceptable, impede the adoption of this new steel grade until approvals are granted.

Competitiveness of the domestic industry

In the U.S construction market, the improved competitive posture of domestic structural steel has not been limited to matters of material substitution. Structural steel producers and fabricators in the United States, taken as a whole, have steadily improved their share of apparent consumption since 1984. Imports as a share of consumption have fallen from 37.6 percent in 1984 to 29.6 percent in 1988. Year to date figures indicate the trend continuing, with current import penetration standing at 25.8 percent through August.

U.S. producers have recently improved their export performance as well. After a low of 71,525 tons exported in 1986, export shipments rose to 111,614 tons in 1988. Export shipments through August 1989 are well ahead of last year's total, with 171,281 tons shipped to foreign destinations. Declining domestic demand in the last two quarters of 1989 will increase pressures on manufacturers to seek export sales.

Much of the recent increase in exports is attributable to the efforts of Chaparral Steel Co., Midlothian, TX. Chaparral has pursued an export strategy concentrating on markets in Europe and Japan. It is the first North American steelmaker to obtain approval from JIS, the Japanese standards organization. JIS certification is required for materials to be used in most building projects in Japan. Other structural producers, including Nucor-Yamato and Northwestern Steel and Wire, have indicated that they either have been or will be seeking export sales.

Much of the improved competitiveness of domestic manufacturers vis-a-vis foreign producers is related to more competitive (i.e., lower) prices. The mid-1988 opening of Nucor-Yamato's state-of-the-art structural mill in Blytheville, AK, for example, resulted in downward pressure on prices, especially in southern states. A round of price reductions in June and July, and another round in September, have served to lower prices by approximately 10 percent. Minimill list prices for A36 grade material, the standard carbon steel structural grade, are at about \$365-\$370 per ton, whereas minimill list prices for standard high strength material (A572) are at about \$375-\$380 per ton. Integrated list prices (before discounting) are up to 30 percent higher. Transaction prices are likely to be close to the minimill list prices.

Imported structural shapes compete primarily on a price basis with domestic material⁴ and the recent price reductions by domestic producers have brought the selling prices of domestic products down to prevailing import prices. Importers of structural shapes are finding it increasingly difficult to compete in the domestic market; import levels through September are 20 percent

⁴ The primary exceptions are very large rolled beams (with a web depth exceeding 36 inches) which are not produced by U.S. firms.

lower in 1989 than in 1988. Of the 20 VRA signatories, the seven⁵ which have specific quota levels for structural shapes and units typically account for over 99 percent of such imports from VRA countries. Imports through the end of September indicate that these seven sources may undership their quotas by 20 to 25 percent.

Short-term cyclical forces and long-term structural forces should combine to hold down prices for medium and heavy standard beams, channels, and wide flange beams. Seasonal demand fluctuations and reports of large inventories being held by service centers and fabricators will apparently continue to hold prices from rising in the near term. Northwestern's planned 1990 reopening of a 600,000 ton-per-year mill in Houston is expected to further reduce the average cost structure of the U.S. industry. It will also increase productive capacity for certain sizes and shapes well beyond domestic requirements. The presence of this additional low cost capacity may serve as the impetus to the closure of some integrated mill capacity.

Preface

On April 9, 1986, at the request of the Subcommittee on Trade, Committee on Ways and Means, U.S. House of Representatives, and in accordance with the provisions of section 332(b) of the Tariff Act of 1930 (19 U.S.C. 1332(b)), the United States International Trade Commission instituted investigation No. 332-226, Monthly Reports on the Status of the Steel Industry. The purpose of the reports is to monitor developments in the steel industry through September 1989, which corresponds with the President's program of voluntary restraint arrangements (VRA's) with certain countries and regions which export steel to the United States.

Background of VRA's

On September 18, 1984, the President determined, under section 202(b)(1) of the Trade Act of 1974, that taking "escape clause" action was not in the national economic interest (49 Federal Register 36813). The decision followed an investigation conducted by the Commission in which imports of certain steel products¹ were found to be a substantial cause of serious injury, or threat thereof, to certain domestic industries (investigation No. TA-201-51). Instead of taking action under the statute, the President established a nine-point policy to address the concerns of the industry. Under this policy, the President directed the United States Trade Representative to negotiate voluntary restraint arrangements to cover a five year period (from October 1, 1984 through September 30, 1989) with countries whose exports to the United States had increased significantly in recent years due to an unfair surge in imports. These measures were expected to return the share of imports in the U.S. market to a more normal level of approximately 18.5 percent, excluding semifinished steel (which, subsequent Administration statements indicate, would be limited to about 1.7 million tons per year).

Specialty steel

On July 19, 1983, the President announced his decision to grant import relief to the specialty steel industry for a period of 4 years (53 Federal Register 52897). The relief was scheduled to expire on July 19, 1987. Under the relief, quotas were put on imports of stainless steel bars, stainless steel wire rods, and certain alloy tool steel products; increased duties were imposed on stainless steel plates and stainless steel sheets and strip. On July 16, 1987, the President announced his decision to extend the import relief in the form currently in effect for a period from July 20, 1987 through September 30, 1989. Under the steel VRA's, in return for their agreement to limit exports of stainless steel plates and sheets and strip, the VRA countries were exempted from having to pay additional duties (with the exception of Finland, whose VRA does not include stainless steel flat-rolled products); quotas were unaffected by the VRA's for all countries except the

¹Affirmative decisions were rendered in the case of semifinished steel, plates, sheets and strip, wire and wire products, and structural shapes and units. Negative determinations were rendered in the case of wire rod, railway type products, bars, and pipes and tubes.

EC-10, which negotiated limits on rods, bars, and alloy tool steel as part of its VRA, Brazil whose VRA now includes the specialty steel products subject to quotas, and Austria, which included alloy tool steel in its VRA.

In this report trade data are reported in a similar format for all product categories; in the case of stainless steel bars, stainless steel rods, and certain alloy tool steel products, however, it should be noted that, except for the EC-10 and Austria, all countries are bound by quotas (see App. C for a description of the specialty steel relief provisions and implementation of modifications in specialty steel import relief).

Current Status of VRA's

On July 25, 1989, President Bush announced his Steel Trade Liberalization Program to extend the VRAs for two and a half years, terminating in March of 1992. On October 2, the House of Representatives passed a bill to grant the President the authority to continue to enforce the VRAs; more recently, the Senate Finance Committee's Subcommittee of International Trade held hearings on the House legislation and recommended passage of the bill without amendment. However, mark-up of the bill by the full Finance Committee has not yet been scheduled. In the interim, United States negotiators are trying to work out new agreements with each of the previous VRA signatories. The actual terms of the new VRAs are not known, as the negotiations are still ongoing.

Notes on Product Coverage and Methodology

Data on foreign trade imports and exports and domestic shipments are compiled from official statistics of the U.S. Department of Commerce, and statistics of the American Iron and Steel Institute (AISI), respectively.

The products on which foreign trade data are collected correspond to those covered by the VRA's with the stainless steel wire strand (HS item 7312.10.0500), stainless steel wire rope (HS item 7312.10.5000)., and those subject to limitation under separate specialty steel measures. Since the VRA's include certain fabricated products, the data may exceed that compiled by other organizations such as the AISI. The additional tonnage, however, is relatively small. In 1987 AISI reported imports of 20.4 million tons, which compares to the 20.9 million tons indicated in this report. The product categories most affected are structural shapes and units (which includes fabricated structurals in this report) and wire and wire products (which includes wire rope and wire strand).

The term EC in this report does not include Portugal and Spain, which are subject to separate VRA's.

Unit values are calculated using unrounded data. Import values are customs value. Trade data include imports under sections 9802.0060 and 9802.0080 of the Harmonized Tariff Schedules; the 9802.0060 and 9802.0080 provisions apply to U.S. merchandise which is exported, processed, and reimported into the United States.

Appendix A

**Definition of Certain Terms, and Description of the Products Subject
to the Investigation**

DEFINITIONS

1. Steel.--An alloy of iron and carbon which is malleable as first cast and which contains by weight 2 percent or less of carbon. Steel may contain other elements, but iron must predominate, by weight, over each of the other elements.

2. Carbon steel.--Steel, other than chromium, which contains by weight 2 percent or less of carbon, and in which none of the elements listed below meets or exceeds the quantity, by weight, respectively indicated:

1.65 percent of manganese, or
 0.25 percent of phosphorus, or
 0.35 percent of sulphur, or
 0.60 percent of silicon, or
 0.40 percent of copper, or
 0.30 percent of aluminum, or
 0.30 percent of chromium, or
 0.30 percent of cobalt, or
 0.40 percent of lead, or
 0.30 percent of nickel, or
 0.30 percent of tungsten, or
 0.10 percent of any other metallic element.

3. Alloy steel.--Steel which contains any of the elements listed in definition 2 (above) in excess of its specified quantity.

(i) Stainless steel.--Any alloy steel which contains by weight 1.2 percent or less of carbon and 10.5 percent or more of chromium, with or without other elements.

(ii) Tool steel.--Alloy steel which contains the combinations of elements in the quantity, by weight, respectively indicated in Chapter XXII, subchapter III, section (viii) of the Harmonized Tariff Schedule of the United States (HTS). (See appendix B).

4. Galvanized.--Steel which has been coated or plated with zinc.

5. Hot-rolled.--Steel which has been reduced to its final thickness by heating and rolling the product at elevated temperature (usually above 2,200° F).

6. Cold-rolled.--Steel which has been reduced to its final thickness by rolling the product without heating it immediately prior to the rolling operation.

7. Continuous casting.--The method of producing semifinished products in which molten steel flows evenly into a caster where it is rapidly cooled, causing it to solidify directly into semifinished products such as slabs and billets.

8. Short ton.--Two thousand (2,000) pounds.

Unlike the TSUSA system of classification, the HTS do not differentiate by dimension those steel products formerly referred to as blooms and billets, slabs and sheet bars, plate, sheet, and strip. Instead, these products are included in two larger categories: flat rolled and semifinished (described below). However, for purposes of comparability with previous Monthly Reports, and in the interest of providing useful information and coverage of the steel industry, this report will continue to designate such product categories (e.g. blooms and billets, slab and sheet bars, plate, hot-rolled and cold rolled sheet, and strip). A partial basis for classification are those definitions found in Federal Register Notice 52897, December 29, 1988 (Appendix C).

9. Semifinished products include:

Continuous cast products of solid section, not presented in coils, whether or not subjected to primary hot-rolling.

Other products of solid section which have not been further worked than subjected to primary hot-rolling or roughly shaped by forging, including blanks, angles, shapes, or sections.

For the purposes of this legislation semi-finished products are classified as follows:

(i) Ingots.--Castings resulting from the solidification of molten steel and having a columnar form suitable for working by rolling or forging. Ingots are included in AISI (American Iron and Steel Institute) product group No. 1A.

SUPPLEMENTARY INFORMATION:
Presidential Proclamation 5679 of July 16, 1987 (52 FR 27306) provided for the temporary imposition of increased tariffs and quantitative restrictions on certain stainless steel and alloy tool steel imported into the United States, pursuant to section 203 of the Trade Act of 1974. Proclamation 5679 authorizes the U.S. Trade Representative to take such actions and perform such functions for the United States as may be necessary to administer and implement the relief, including negotiating orderly marketing agreements and allocating quota quantities on a country-by-country basis. The U.S. Trade Representative is also authorized to make modifications in the TSUS headings of items proclaimed by the President in order to implement such actions.

On January 1, 1989, the TSUS will be replaced by the Harmonized Tariff Schedule of the United States (HTS). Accordingly, the U.S. Trade Representative has determined that the following revisions to Chapter 98, subchapter III, of the HTS are required for continued implementation of Proclamation 5679 after December 31, 1988.

Replace the entire text of U.S. note 4(a)(ii) with the following:
