THE CHAIRMAN

UNITED STATES TARIFF COMMISSION

WASHINGTON, D. C. 20436

April 9, 1974

Honorable Russell B. Long  
Chairman, Committee on Finance  
United States Senate  
Washington, D.C. 20510

Dear Mr. Chairman:

The Tariff Commission has concluded the study of tariff and nontariff trade barriers made pursuant to a request from you and Senator Abraham A. Ribicoff, Chairman, Subcommittee on International Trade of the Senate Finance Committee, dated April 21, 1971. Copies of the Commission's report on its investigation are being sent to you and to Senator Ribicoff.

You will see from the Commission's report that world traders must cope with an almost endless variety of practices by both government and private organizations which they have reported to the Commission as trade barriers.

The Commission's study of trade barriers has been conducted with considerable difficulty stemming from two sources. First, the subject is virtually boundless. Secondly, although much work has been done in particular areas, such as tariffs and some of the more important quantitative restrictions, relatively little has been done in the way of systematic assembly of information on the entire range of practices which have been described by businessmen and others as trade barriers. Some of the practices so characterized are intended specifically to limit or direct trade flows, while others, such as measures taken to protect the environment, are imposed for reasons totally unrelated to trade but unavoidably affect trade.

It is hoped that this report will be helpful to the Committee in its deliberations.

Sincerely,

Catherine Bedell  
Chairman

THE CHAIRMAN

UNITED STATES TARIFF COMMISSION

WASHINGTON, D. C. 20436

April 9, 1974

Honorable Abraham A. Ribicoff  
Chairman, Subcommittee on International  
Trade of the Committee on Finance  
United States Senate  
Washington, D.C. 20510

Dear Mr. Chairman:

The Tariff Commission has concluded the study of tariff and nontariff trade barriers made pursuant to a request from you and Senator Russell B. Long, Chairman, Senate Finance Committee, dated April 21, 1971. Copies of the Commission's report on its investigation are being sent to you and to Senator Long.

You will see from the Commission's report that world traders must cope with an almost endless variety of practices by both government and private organizations which they have reported to the Commission as trade barriers.

The Commission's study of trade barriers has been conducted with considerable difficulty stemming from two sources. First, the subject is virtually boundless. Secondly, although much work has been done in particular areas, such as tariffs and some of the more important quantitative restrictions, relatively little has been done in the way of systematic assembly of information on the entire range of practices which have been described by businessmen and others as trade barriers. Some of the practices so characterized are intended specifically to limit or direct trade flows, while others, such as measures taken to protect the environment, are imposed for reasons totally unrelated to trade but unavoidably affect trade.

It is hoped that this report will be helpful to the Committee in its deliberations.

Sincerely,

Catherine Bedell  
Chairman

COMMITTEE ON FINANCE  
WASHINGTON, D.C. 20510

April 8, 1974

The Honorable  
Catherine Bedell  
Chairman  
United States Tariff Commission  
Washington, D. C.

Dear Madam Chairman:

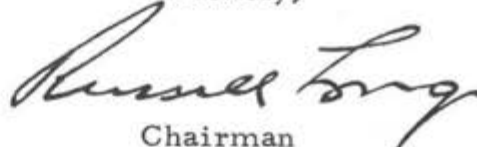

The Committee on Finance requested several major studies from the Tariff Commission on foreign trade and investment matters. The Commission has done a magnificent job in studying these issues in tremendous depth. The latest study on nontariff barriers appears to be the most detailed study ever done on the subject by any institution.

I would like to take this opportunity to congratulate the staff on the Commission who have labored long and hard on these studies. In connection with the multinational corporation study, Mr. Robert Cornell should be singled out for his diligence. A thorough job was done by Mr. Dana Law in the customs valuation study with important contributions by the General Counsel, Russell Shewmaker, who many consider the "father" of the Tariff Schedules of the United States. Finally, Mr. William Hart should be singled out for his patience and perseverance in completing this latest study on tariff and non-tariff barriers.

We hope the Commission will continue to work together toward the common objective of providing the Congress with facts on the many complex trade and related issues with which we deal.

With every good wish, I am

Sincerely,

Chairman

## Chapter I

### SUMMARY

Trade is normally the most important peacetime relationship among nations. During the past 25 years, world trade has grown at double the pace of the beginning quarter of this century, which in turn was roughly double the pace of the last quarter of the 19th century. World exports were valued at \$56.7 billion in 1950, \$280.7 billion in 1970, and \$372.4 billion in 1972. U.S. exports amounted to \$10.3 billion in 1950, \$42.6 billion in 1970, and \$70.2 billion in 1973, while U.S. imports were valued at \$8.7 billion in 1950, \$39.8 billion in 1970, and \$68.7 billion in 1973.

#### The Major Determinants of Trade

The principal determinants of trade have been gross national product (GNP) performance, the international monetary system, the diffusion of technology, and the general trading climate created by commercial policies of the principal trading nations. Trade barriers generally are reflections of various aspects of commercial policies of nations as they attempt to control foreign trade, investment and shipping to their particular advantage, but trade barriers may also result from measures taken for purposes not related to commercial policy.

For developed market economies, GNP performance is the engine of trade growth and, by far, the dominant factor affecting trade performance. Commercial policies may be conducive to trade growth (which has been generally the case for the past 25 years), or they may be antagonistic to the extent that they severely damage economies and may even provoke hostilities.

#### The Volume and Direction of Trade Flows

World trade is overwhelmingly concentrated among the major market

economies, all of which are highly industrialized with fairly comparable technology, and all of which have manufactured goods as their leading exports and imports, except Japan where only 30 percent of imports are manufactures. For the industrialized countries as a whole, about 12 percent of trade is in agricultural products, 88 percent is in the industrial area. The European Community (as composed of six nations before enlargement), <sup>1/</sup> the United States, the United Kingdom, Japan, and Canada together account for about 57 percent of total world trade.

The volume and direction of the major world trade flows can be seen in the following table.

Table 1-A.--Volume and direction of major trade flows in 1970

Country	United States	Canada	Japan	European Community <sup>1/</sup>	United Kingdom	Other OECD countries
<b>Exports</b>						
<u>Destination</u>						
World total (billions)-----	\$42.6	\$16.6	\$19.3	\$45.2	\$19.3	\$28.5
United States-----	-	65.4%	31.1%	14.7%	11.1%	7.6%
Canada-----	20.6%	-	2.9%	1.6%	3.4%	1.2%
Japan-----	10.7%	4.7%	-	2.2%	1.8%	1.3%
European Community-----	19.2%	7.1%	6.7%	-	21.3%	30.2%
United Kingdom-----	5.7%	8.9%	2.3%	8.1%	-	14.1%
Other OECD countries-----	7.2%	2.6%	5.7%	33.0%	23.1%	24.7%
Non-OECD developed countries-----	4.6%	3.8%	10.7%	11.2%	13.3%	8.1%
Less developed countries-----	28.7%	7.5%	40.0%	28.3%	22.1%	12.7%
<b>Imports</b>						
<u>Suppliers</u>						
World total (billions)-----	\$40.0	\$13.3	\$18.9	\$45.6	\$21.7	\$38.6
United States-----	-	71.0%	29.5%	19.8%	12.7%	8.9%
Canada-----	27.8%	-	4.9%	2.8%	7.3%	1.2%
Japan-----	14.7%	4.2%	-	2.7%	1.5%	2.8%
European Community-----	16.5%	5.8%	5.9%	-	19.7%	38.0%
United Kingdom-----	5.5%	5.3%	2.1%	8.8%	-	12.4%
Other OECD countries-----	5.7%	2.3%	2.4%	19.7%	20.3%	19.0%
Non-OECD developed countries-----	3.4%	2.3%	15.5%	9.5%	10.3%	5.6%
Less developed countries-----	26.3%	8.4%	39.7%	36.6%	22.6%	11.9%

<sup>1/</sup> Data for the European Community are for external trade only. Intra-EC exports were valued at \$43.3 billion, intra-EC imports at \$42.8 billion.

Source: Compiled from OECD Statistics of Foreign Trade, Series C, 1970.

<sup>1/</sup> Throughout this report, unless otherwise indicated references to the European Community (EC) deal with that organization as constituted before enlargement on January 1, 1973.

The ten leading markets for U.S. exports and suppliers of U.S. imports in 1972 were as follows:

Exports		Imports	
(Millions of dollars)			
1. Canada	12,415.2	1. Canada	14,872.5
2. European Community	8,815.0	2. Japan	9,036.2
3. Japan	4,941.2	3. European Community	8,937.4
4. United Kingdom	2,658.2	4. United Kingdom	2,975.3
5. Mexico	1,982.2	5. Mexico	1,616.5
6. Brazil	1,242.9	6. Venezuela	1,312.1
7. Spain	930.2	7. Taiwan	1,285.6
8. Venezuela	923.7	8. Hong Kong	1,237.1
9. Australia	843.0	9. Brazil	932.1
10. Korea	735.4	10. Australia	799.5

#### Tariffs

Averages of rates of duty, weighted in various ways, are used to summarize a nation's customs tariff, although there is no really satisfactory method for averaging tariff rates to meaningfully reflect the significance of the various duties and their actual impact on the flow of trade. 1/  
Average most-favored-nation (MFN) tariff levels

Average MFN tariffs in effect in 1972 for the United States, Canada, Japan, the European Community and the United Kingdom are shown in table 1-B for industrial products and table 1-C for agricultural products. Tariff averages for most other industrialized nations fall generally in the same range as those shown for the countries in the tables. The averages indicate that the bulk of world trade today faces tariffs of 10 percent or less for industrial products and somewhat higher rates for agricultural products. The averages, however, mask the extremes in tariffs. Every 1/ Tariffs of the major trading nations are discussed in detail in chapter IV and in the product sectors in Part III (chapters XIII, XIV, and XV).

Table 1-B.--Industrial products: Average MFN tariffs for selected countries

Country	Simple arithmetic average 1/	Averages weighted by--		
		World trade	Country's own trade	Country's own and world trade
All products				
United States-----	11.1	7.3	6.8	6.3
Canada 2/-----	9.3	6.8	6.6	7.3
Japan 2/-----	10.1	10.1	6.3	10.1
European Community-----	6.9	6.4	4.5	6.5
United Kingdom-----	9.2	7.8	6.2	7.3
Average for 18 industrialized countries-----	9.0	7.3	5.9	7.1
Dutiable products				
United States-----	12.1	8.1	8.8	7.1
Canada 2/-----	15.2	11.5	14.1	11.0
Japan 2/-----	11.2	10.8	11.6	10.7
European Community-----	7.5	6.7	8.1	6.9
United Kingdom-----	10.5	8.5	10.2	8.1
Average for 18 industrialized countries-----	10.7	8.4	9.8	8.1

<sup>1/</sup> The implicit weight contained in a simple average is the number of tariff lines in the schedule; thus, the average is in fact weighted by the degree of detail within the tariff schedules.

<sup>2/</sup> Since these averages were calculated, Japan and Canada have made significant temporary reductions in their tariffs. For Japan, about 80 percent of the rates were reduced by 20 percent, about 2 percent were made duty-free, and about 6 percent were cut by amounts ranging from 10 to 95 percent. Canada has made reductions on a wide range of products, particularly consumer goods, by an average of 5 percentage points.

Source: Basic documentation for the Tariff Study, GATT.

industrialized country enters a significant portion of its imports duty-free, but most also have some very high rates of duty. Several industrialized countries still have rates of duty on individual products ranging well above 50 percent ad valorem. Consequently, contrary to some popular beliefs, tariffs continue to be an important consideration in international trade.

Over 500 complaints, or 10 percent of the total submitted to the Tariff Commission in the present study of trade barriers, concerned tariffs. The eight countries formerly making up the European Free Trade Association (EFTA)

Table 1-C.--Agricultural products: Average MFN tariffs for selected countries

Country	Simple arithmetic average	Own-trade- weighted average
	All products	
United States-----	15.1	4.8
Canada-----	9.6	5.7
Japan 1/-----	40.6	27.4
European Community 2/-----	16.5	8.4
United Kingdom 3/-----	10.8	5.0
	Dutiable products	
United States-----	16.8	8.5
Canada-----	13.1	9.9
Japan 1/-----	44.2	39.7
European Community 2/-----	17.9	13.9
United Kingdom 3/-----	12.7	9.9

1/ Since these averages were calculated, Japan has made significant further temporary reductions in about one-fourth of its rates which were used in the calculations. More than half of the reductions were by 20 percent, and most of the remainder were by amounts ranging from 33 percent to complete removal of the duty.

2/ Rates shown for the European Community reflect fixed tariffs only and do not include variable levies applicable to a wide range of agricultural products. If data were available to reflect the variable levy charges, the rates would be very substantially higher than indicated here.

3/ The rates shown for the United Kingdom reflect fixed tariffs only and do not reflect variable levies applicable to a limited number of products in the year for which the averages were calculated.

Source: Compiled from national tariffs and trade statistics.

were the object of about 13 percent of these complaints; the European Community received about 9 percent; Canada and Australia, each about 5 percent; and the United States and Japan, each about 4 percent. Less developed countries (a large number were named) were the object of 53 percent of the complaints against tariffs.

#### Discriminatory tariff treatment

Customs unions and other regional trade groups and preferential trading arrangements have proliferated throughout the world in the past 15

years and created significant discrimination against products of countries outside such arrangements. Even a modest duty can foreclose participation in a market if other competing foreign suppliers are permitted free entry.

In 1955, almost 90 percent of imports by contracting parties of the General Agreement on Tariffs and Trade (GATT) paid MFN rates of duty; by 1970, this figure had declined to only 75 percent. With the recent enlargement of the European Community, the extension of duty-free treatment on industrial products to the remaining EFTA neutrals in the EC association agreements with these countries, and generalized tariff preferences for all less developed countries, the United States, Canada and Japan have become the only important trading countries whose products will be dutiable in Europe. Tariff discrimination obviously has become one of the major concerns for U.S. trade.

#### Tariff disparities

A common complaint received by governments from domestic producers seeking to export their products is that higher tariff rates are encountered in foreign countries than are charged on imports into the producer's own domestic market. U.S. producers have made such complaints most frequently against tariff rates of Canada and Japan, and exporters in the European Community have frequently leveled the same charge against the United States.

Significant tariff disparities are most likely to be found when a country has a wide range of rates applicable to a category of products. This situation occurs more commonly in the U.S. tariff than in the schedules of most other nations. For leading items of exports from the United States

to Canada and Japan and leading items of imports from these countries into the United States, the United States characteristically has the greater range of duty rates and the greater likelihood of having the disparate high tariff. For these leading products, U.S. and Canadian rates divide fairly evenly between higher and lower; but in the case of Japan, there are more situations where U.S. rates are higher than Japan's than vice versa.

At a more disaggregated product level, Canada has markedly more disparities vis-a-vis the United States than the United States vis-a-vis Canada, but the United States has more disparities vis-a-vis Japan and the European Community than vice versa.

#### Tariff reductions in trade agreements 1/

In 1934 the United States launched a program for the reciprocal reduction of national tariffs through the negotiation of international trade agreements. By 1947, as a result of bilateral agreements negotiated with 29 countries, the average level of the U.S. tariff had been reduced by one-third. Under the General Agreement on Tariffs and Trade, negotiated in 1947, there have been six major rounds of multilateral negotiations for tariff concessions, as well as various lesser negotiations, which have extended the reduction in the U.S. tariff to 72 percent below the pre-trade-agreement level.

---

<sup>1/</sup> The nature and extent of tariff concessions granted in trade agreements to which the United States is a party by the principal trading nations are discussed in detail in chapter V, together with the important qualifications attached to an interpretation of the data shown in table 1-D of this section.

The change in a country's average tariff level over time is a function of three factors: Changes in the individual nominal rates of duty in the tariff schedule; changes in the prices of products subject to specific rates of duty; and changes in the composition of imports. All of these changes have been of major proportions for the United States and other countries since 1934. The practical and theoretical difficulties in averaging tariffs are doubly compounded if a comparison is to be made between average tariff levels at different points in time, and especially if the purpose of the comparison is to determine the amount of change due to a single factor, such as modification in the nominal rates of duty.

The Tariff Commission has attempted to determine the percent of reduction which has taken place in average duty levels of the United States, Canada, Japan, the European Community and the United Kingdom as a result of tariff concessions in trade agreements to which the United States has been a party. The results of the calculations are shown in table 1-D. The major part of the provisions in the tariff schedules of the industrialized countries are covered by concessions under the GATT.

#### Nontariff Barriers to Trade

Innumerable practices, other than tariffs, by governments and private organizations interfere with or distort the flow of trade. The most obvious and easily identifiable of these are quantitative restrictions, such as quotas and embargoes. However, nontariff trade barriers appear in a

Table 1-D.--Percent of reduction in average tariff levels by trade agreements

Country	: Base : year 1/	: Industrial : products 2/	: Agricultural : products 3/
United States-----	: 1933	: 72.1	: 61.9
Canada-----	: 1935	: 58.2	: 66.2
Japan-----	: 1954	: 25.0	: 15.2
European Community <sup>4/</sup> -----	: 1960	: 44.3	: 29.9
United Kingdom-----	: 1938	: 59.6	: 37.6

1/ The base year for the United States is the year preceding inauguration of the trade agreements program. For other countries shown, it is the year preceding the first trade agreement negotiated with the United States under the program.

2/ Percents of reduction for industrial products have been calculated using own-trade-weighted average tariffs for all countries except Canada, for which a simple arithmetic ("unweighted") average tariff was used.

3/ Percents of reduction for agricultural products have been calculated using simple arithmetic ("unweighted") average tariffs for all countries.

4/ For the European Community, the percent of reduction is that which has taken place in the EC's Common External Tariff since it was initially established by taking a simple average of the rates contained in the four antecedent national tariff schedules on January 1, 1957. The initial EC tariff rates already reflected some tariff reductions made in trade agreements negotiated prior to formation of the Community, but it was not feasible to determine a preagreement rate based on tariffs in effect in 1934, which was just prior to the first reciprocal trade agreement between the United States and an EC member country.

host of less conspicuous but equally effective practices, such as "buy-national" policies in government procurement, government subsidies which stimulate exports and substitute domestic products for imports, a variety of nontariff charges on imports, numerous standards which imported products must meet, and administrative devices which escalate the cost and inconvenience of importing goods.

Outside of some of the more common protective devices, such as quotas and a few other practices, nontariff trade barriers elude any general fixed definition. A very large part are generated simply because of differences

among countries in their regulatory or tax systems. Illustrations of this are found in having to conform to standards based on a system of measurement, such as the metric system, which differs from that used in the producer's country, or having to use metric measures in labeling products, or having to conform to different automobile safety requirements and different health or sanitary requirements and regulations

Many of the nontariff trade barriers are intimately interwoven into the economic and social structures of nations, and consequently are extremely difficult to remove, or change, or even to alleviate in any manner. President Franklin D. Roosevelt is reported to have said that trying to get rid of nontariff barriers is like trying to dynamite a fog.

Nontariff trade barriers will not be easily removed because a very large part of them are linked to such domestic economic and social objectives as the promotion of employment in high unemployment areas, or the development of priority sections in national economies, or preservation of government control of certain products, or maintaining a minimum production base for national security reasons, or for balance of payments reasons, or simply for the protection of consumers. Also, nontariff trade barriers are frequently a side effect of measures imposed entirely for non-trade-related reasons.

Categories of Nontariff Trade Barriers 1/

Nontariff trade barriers have usually been classified into five or six loosely defined categories in work done in this area in recent years. For the present study, the Tariff Commission has used the following six categories:

1. Quantitative restrictions and similar specific limitations on trade
2. Nontariff charges on imports
3. Government participation in trade
4. Standards as technical barriers to trade
5. Customs procedures and administrative practices
6. Discriminatory ocean freight rates.

These six major categories are described briefly in the following pages.

Quantitative restrictions and similar specific limitations on trade 2/

Quantitative import and export restrictions appear in three basic forms: Embargoes (trade is prohibited), absolute quotas (a specified maximum amount of trade is permitted in a given period), and licensing systems (administrative officials have discretionary authority to permit trade). Other indirect and more subtle quantitative restrictions include: Exchange controls, local content and mixing regulations, restrictive business practices, and discriminatory bilateral agreements.

About one-third of the complaints against all trade barriers submitted in the Commission's investigation dealt with the various types of specific limitations on trade, and over 60 percent of the complaints were against developing nations. Conclusions reached from an analysis of quantitative

---

1/ A resume' of the major nontariff barriers is given in chapter VI, and each of the major categories is discussed in detail in chapters VII through XII.

2/ See chapter VIII for a detailed discussion of the various specific limitations on trade.

restrictions in 16 major developed trading countries indicate that France has exhibited the heaviest use of such measures, followed by Italy, the United States, West Germany, the United Kingdom, and Japan.

"Voluntary" export restraints have become increasingly important as a barrier to trade in recent years. Restraints on textiles and steel have received the most publicity recently, but a wide variety of exports have been restricted from time to time. Exports are also sometimes controlled for military or strategic reasons, to conserve domestic supplies, or for political purposes. Several countries have restricted exports of products in short supply.

A widely-used type of trade barrier is a system of restrictions on the payments and/or financial cycle of a trade flow (e.g., multiple exchange rates, prior import deposits, allocation of exchange only to holders of import licenses, and various other types of restrictions to conserve foreign exchange). Some countries have tended to exert stronger financial restrictions than are needed, given their financial situation.

International restrictive business practices, another specific limitation on trade, are usually of two types: Those engaged in by the collective restraint of competition by independent organizations (cartels) and restrictions resulting from concentration of economic power or control in one organization (multinational corporations). Single firms may restrict international trade if they have a dominating position as suppliers or purchasers of the product involved.

Bilateral trade agreements which grant special exclusive advantages to the two parties are implicitly discriminatory against third countries. Discriminatory sourcing results from some bilateral agreements which favor specific countries as sources for certain imports.

Nontariff charges on imports 1/

Generally, imports pay a variety of charges beyond a customs duty. These charges may be protective devices to restrict imports, or they may be collected to equalize the tax treatment of imported goods with that of domestic products, or they may be payment for services. Some of the greatest barriers to world trade are found among these charges.

Variable levies are charges on imports in lieu of, or in addition to, normal customs duties. The levies vary far more frequently than normal customs duties (sometimes daily) and are used to raise the cost of imports to stipulated minimum prices, often in conjunction with domestic agricultural support programs. The European Community has made the variable levy an essential part of its Common Agricultural Policy (CAP), and such levies are also found in Austria, Finland, Greece, Portugal, Spain, Sweden, and Switzerland. The variable levy greatly affects world trade and is probably the most important single measure adversely affecting U.S. exports. Variable levies keep imports from price competition with domestic products, and reduce imports to the position of a residual supply.

A border tax adjustment, another nontariff charge on imports, is any fiscal measure which enables imported products to be charged with a tax charged in the importing country on similar domestic products, and which

---

1/ See chapter VII for a detailed discussion of nontariff charges on imports.

enables exported products to be relieved of a tax charged in the exporting country on domestic products sold to consumers in the home market. Thus, border tax adjustments include taxes on imports at importation and at any subsequent point in the distribution channel. Nearly all countries make some border tax adjustments.

Under the GATT, indirect taxes are considered eligible for border tax adjustments, while direct taxes are not. The major foreign indirect (or consumption) taxes are collected when the goods enter the country, but exported goods are not subject to the consumption tax. Since the United States relies much less than foreign countries on indirect taxes for government revenue, very few U.S. imports are subject to a border tax adjustment at the time of entry.

U.S. businessmen complain that they are greatly disadvantaged both in foreign markets and in the U.S. market because when selling abroad they bear the burden of both U.S. direct taxes and the indirect taxes of the foreign country, and when selling in the United States, the imported product of their foreign competitors has been relieved of part of its national tax burden and bears none of the U.S. direct taxes. Economists tend to dispute this view.

A special situation in the application of border taxes is found in the manner in which the U.S. excise tax on distilled spirits is assessed. If distilled spirits are below 100 proof when the tax is assessed, they are still taxed as 100 proof; above 100 proof a proportional incremental amount of the basic 100 proof rate is applied. U.S. producers as well as foreign producers who ship their product in bulk to the United States, can have the

tax assessed before the beverage has been cut to normal bottling strength. If it is bottled abroad, it will bear the additional revenue burden resulting from tax assessment after the proof is cut to bottling strength. Thus, imported bottled spirits pay a higher tax than domestic products and imported bulk products.

There are numerous other nontariff charges on imports. Among these are port charges (fees on vessels and/or cargo using the port), prior import deposit systems (requiring importers to deposit a percentage of the value of an import), consular fees (charges usually made in relation to the issuance of a consular invoice or other documentation), stamp taxes (excise taxes paid through the purchase of stamps which must be affixed to articles or documents before they can be lawfully sold), and import surcharges (taxes or levies in addition to the normal duty, and sometimes collected as a percentage of the normal duty).

#### Government participation in trade <sup>1/</sup>

Governments participate directly or indirectly in trade in various ways, such as through government monopolies, government procurement, nationalization of basic industries, and governmental assistance to domestic industries. Complaints submitted to the Tariff Commission listed subsidies and other aids as the major concern in this area, followed by governmental monopolies and state trading, and government procurement. Seventy percent of the complaints in this area were against practices of developed countries.

International trade can be distorted by government aids designed explicitly to stimulate exports, but also by general government subsidies

---

<sup>1/</sup> See chapter IX for a detailed discussion of trade barriers associated with government participation in trade.

given to domestic producers. A wide range of government activity may constitute a subsidy. The principal forms are cash subsidies, tax subsidies, credit subsidies (loans at preferential rates of interest), benefit-in-kind subsidies (provisions of goods and services at prices or fees below market value), and purchase subsidies (government purchases of goods and services above market price).

Export subsidies are designed exclusively with the intent to stimulate exports. Credit subsidies have constituted a fast growing area of export subsidization in recent years, principally in the form of direct loans, guarantees of loans made by commercial banks to foreign buyers of the country's exports, and insurance and guarantee of credits extended by exporters.

In order to sustain indigenous energy resources, governments often subsidize the domestic coal and petroleum industries. The electronics industry receives government aids in a number of industrial countries. The film industry enjoys government aids to production, distribution, exhibition and export in various combinations in different countries, though not in the United States. Shipping and shipbuilding are widely subsidized owing especially to the relationship of these industries to foreign trade and the fact that these industries relate to national defense. The aircraft industry is a well subsidized growth industry. In some countries, the steel, paper and pulp, and textile industries are subsidized. Establishments in almost any industry can obtain government aids in some countries if they are located in so-called development areas (e.g., the aluminum industry of the United Kingdom). In most advanced countries several industries receive government aids for purposes of research and development.

The governments of most industrial countries aid their domestic agriculture materially, simultaneously protecting it from import competition principally by various other nontariff barriers.

Governments are the largest purchasers of goods, and the preferences they grant to domestic producers constitute a significant impediment to international trade.

Most governments in market economy countries maintain monopolies of the manufacture or sale of certain goods. In addition, governments frequently engage in buying or selling goods for nongovernment use in situations which do not involve any elements of monopoly. In market economy countries state monopolies in selected products traditionally were instituted to raise revenue or regulate the supply or price of staple commodities which are important to the nation's welfare. State monopolies have also been used for social control.

In recent years, state trading in market economies has been given impetus by two factors: The increase in national economic planning and the persistent foreign exchange shortage. The volume and direction of state trade may be determined chiefly in terms of political or social goals and differ greatly from the situation which would prevail if ruled by purely commercial considerations. The importance and implications of state trading can be easily overlooked. The high degree of government ownership of steel production capability in market economy countries has been regarded by the U.S. steel industry as the major nontariff barrier distorting the flow of steel trade throughout the world.

Standards as technical barriers to trade <sup>1/</sup>

Standards are laws, regulations, specifications or other requirements with respect to the properties of products or the manner, conditions or circumstances under which products are produced or marketed. Standards usually concern: Quality, purity, component materials, dimensions, level of performance, etc.; or the health, sanitary, safety, technical or other conditions under which a product is produced or marketed; or a product's packaging or labeling.

Standards are usually constructive and necessary, but sometimes they impede international trade and can be used as protective devices against import competition. Obstacles to trade arise because of differences among national standards and their requirements. Regulations can particularly hinder trade if they are expensive to comply with, based on characteristics peculiar to national production, foster uncertainty as to the acceptability of merchandise, are administered in a discriminatory fashion, or cause extra delay.

Types of standards which have given rise to complaints are: Industrial and product standards, labeling and marking requirements, health and sanitary standards, and pharmaceutical and veterinary standards.

Industrial and product standards relate principally to weights, measures, container sizes, nomenclature, quality, product content, production processes, safety, ecology and environment. Electrical and electronic equipment and automotive products are two closely regulated sectors in this area.

---

<sup>1/</sup> See chapter X for a detailed discussion of trade barriers arising from standards requirements.

Concern for consumer protection is bringing a growing number of products under labeling requirements and expanding information required on labels, occasionally making the cost of compliance a significant factor.

All countries have laws protecting the health of humans, animals, and plants. Complainants commonly reported that trade was hampered by the diversity of regulations among nations and that inspection requirements were costly, repetitive, or impossible to meet.

Trade problems concerning pharmaceutical, phytosanitary and veterinary standards principally involve requirements for testing, plant inspection, special documentation, and the use of a specific pharmacopoeia. Testing requirements may cause unreasonable delay and expense and are sometimes repetitive (e.g., some countries do not accept the validity of tests and approval by the U.S. Food and Drug Administration; French regulations on testing virtually exclude pharmaceutical imports).

#### Customs procedures and administrative practices 1/

Administrative procedures and customs matters other than rates of duty can impinge upon the free flow of trade. Obstacles are found in customs valuation, tariff classification systems, documentation requirements, consular formalities, antidumping practices and other procedures.

The most numerous complaint against customs valuation received in the Tariff Commission's survey came from U.S. exporters objecting to the use of c.i.f. values as the basis for assessing duty in most other countries.

(U.S. import duties are chiefly on an f.o.b. basis, which is lower than

---

1/ See chapter XI for a detailed discussion of trade barriers associated with customs procedures and administrative practices.

the c.i.f. value because it does not include freight and insurance charges.) Objections were made against several countries for assessing duties on the "domestic value" of merchandise in the country of origin if it is higher than the invoice value for the imports being considered; and against a large number of developing countries for using "official values" set by the government, rather than some form of commercial value.

A problem in virtually all valuation systems is establishing a correct customs value for imports not shipped as arms-length transactions between independent unrelated parties. Most countries adjust upward the invoice values of such imports to establish the customs value (commonly referred to as "uplift"), and many complaints were concerned with these uplift procedures

The American selling price valuation method used by the United States for benzenoid chemicals, rubber footwear, low-priced wool knit gloves, and canned clams has long been a target of criticism, as has the complexity of the U.S. valuation system which operates with nine different standards.

Documentation requirements can be excessive in terms of quantity, complexity, formality and time consuming procedures associated with obtaining or clearing the documents.

The complexity of the customs classification systems of the major trading nations has been seen as a trade barrier and has led to a worldwide movement to standardize customs nomenclature. The majority of nations today classify their imports according to the Brussels Tariff Nomenclature, although Canada and the United States do not use this system.

Another practice criticized as a trade barrier concerns the manner

in which nations respond to the unfair competition of foreign dumping in their domestic markets. Laws to discourage this practice exist in most nations. The frequency of antidumping actions (especially by Canada and the United States) is sometimes labeled a deterrent to trade.

Discriminatory ocean freight rates <sup>1/</sup>

Many U.S. producers reported to the Tariff Commission that discriminatory treatment in ocean freight rates outbound from the United States greatly weakens their ability to compete abroad and enhances the competitive strength of foreign industries in the U.S. market. Moreover, since most foreign tariffs are applied on a c.i.f. basis, and most consumption taxes (e.g., the value-added taxes in Europe and the commodity taxes in Japan) are applied on a landed-cost, duty-paid basis, the effects of the discriminatory rate treatment are compounded.

Assessing the Significance of Nontariff Trade Barriers

Very few nontariff trade barriers are susceptible to a quantitative measurement of their impact upon trade, and consequently, assessments of their significance must be based largely on subjective judgments. Assessment is also made difficult by the fact that frequently there may be several barriers impinging upon trade in a particular product at the same time.

The constellation of trade distorting measures which make up part of the European Community's Common Agricultural Policy--domestic subsidies which displace imports, variable levies which exclude imports, and export

---

<sup>1/</sup> See chapter XII for a more detailed discussion of discriminatory ocean freight rates.

subsidies for uneconomic domestic production--probably can be considered the most significant trade barrier which U.S. exports currently encounter among the major nations.

The "voluntary" export restraints, such as those on textiles and steel, would perhaps be ranked by many foreign countries as the most significant barrier to their exports to the United States. Quotas or other forms of quantitative controls imposed by the importing country also rank high in any scale of trade barriers. These would include such products as data processing equipment in Japan and Europe, and some agricultural products in the United States.

The discriminatory government procurement practices which are found in all of the major countries are raised into the ranks of major trade barriers simply by the fact that governments have become the largest purchasers of goods and take as much as one-fifth of the gross national product in some countries.

A variety of products in U.S. trade, both in exports and in imports, have felt an impact from the imposition of product, health or safety standards or labeling requirements. There has been a proliferation of product standards by both governments and private bodies in practically all countries. Because of this, and the increase in governmental concern with the environment and with consumer welfare in general, product standards and labeling requirements have the potential of becoming one of the most prevalent and significant trade barriers.

Governments in all of the major countries aid selected domestic industries in ways ranging from market research to long-term loans, tax

rebates or writeoffs, and outright cash grants. Such practices have produced important distortions of normal trade through the displacement of imports and the introduction on the world market of artificially stimulated exports. For several years the U.S. Government has considered excessive subsidies and other aids in foreign countries one of the major problems confronting U.S. trade abroad and a contributing factor to excessively intense competition in the U.S. market.

Several countries regard U.S. antidumping practices and U.S. methods of customs valuation as major problem for the conduct of their trade with the United States.

U.S. producers and exporters, on the other hand, rank high on their list of trade deterrents the numerous border tax adjustments made on imports in the majority of foreign countries. Although the United States has very few border taxes, the manner in which the excise tax on distilled spirits is applied is regarded by some countries as a major trade barrier.

#### Country Summary

Complaints against trade barriers in the European Community and the nine other countries most frequently mentioned in the Tariff Commission's survey of trade barriers are summarized in the following pages, in the order of the number of complaints against each country. The European Community drew 14 percent of the complaints submitted to the Commission; countries formerly making up the EFTA drew 12 percent; the United States 8 percent, Japan about 5 percent, and Canada about 2 percent. Less developed countries in Latin America drew 23 percent of the complaints; in Asia, 9 percent; in Europe, 10 percent; and in Africa, about 9 percent.

European Community and member states

Objections to the various forms of border tax adjustments and other taxes and fees encountered by imports entering member states of the European Community made up one-fifth of the complaints filed against the Community. The second largest area involved subsidies under the EC's Common Agricultural Policy as well as subsidies and other governmental aids by member states to domestic production and exports, particularly in certain electronic products and computers, coal, coke, steel, aircraft, heavy electrical equipment, motion pictures and ships. The requirement of a license for the importation of a substantial number of products ranked as the third most frequently mentioned barrier in the Community. Health and safety standards and industrial standards on a broad spectrum of industrial products were notified as impeding trade. Products as diverse as live chickens, automobiles, refrigeration equipment, electronic components, and many food items were reported to be affected. A number of complaints were received concerning quotas, particularly on agricultural products.

Objections to the EC tariff system were among the top 10 categories of complaints against the Community, and these involved the height of the duty on numerous products, the tariff discrimination which is the essence of any common market arrangement, and the preferential treatment extended to several countries through association arrangements. Discriminatory government procurement practices, pharmaceutical standards and variable levies ranked 8th, 9th and 10th, respectively in complaints against member states and the Community as a whole.

The member countries most frequently named were, in order, Italy, France and West Germany.

#### United States

The categories of practices most often cited in complaints against the United States were (in descending order, by number of complaints): Customs valuation, health and safety standards, quotas, export restraints, embargoes, documentation requirements, licensing requirements, government procurement practices, the customs classification of merchandise, and import duties. Under customs valuation, complaints were made about the American selling price system for certain products, the "final list" valuation system, and the fact that the United States does not use the Brussels Definition of Value. Health and safety standards were perceived as barriers to a broad spectrum of both agricultural and industrial goods, and some U.S. producers felt that high domestic environmental standards hindered their exports by raising costs of production in the United States. Quantitative restrictions were often mentioned for the following products: Petroleum, textiles, watch movements, brooms, sugar, confectionery products and a number of agricultural products including meat and dairy products. Complaints were registered against various export restraints ranging from participation in the Long Term Arrangement Regarding International Trade in Cotton Textiles to programs which limit the export of U.S. goods for strategic or other purposes.

The principal complaint in government procurement sprang from the published preferences which are to be given to domestic products.

Complaints against U.S. customs classification concerned the general complexity of the U.S. tariff nomenclature and the fact that the United States does not use the international Brussels nomenclature used by most of the rest of the world. The level of U.S. duties was said to be a significant barrier for several products.

#### Japan

The most frequently mentioned barriers in complaints against Japan were subsidies and other aids, quotas, high tariffs, exchange and other monetary or financial controls, export restraints, licensing practices, state trading and government monopolies, health and safety standards, restrictive business practices, and miscellaneous taxes. A wide range of direct subsidies and tax incentives were reported to be used for a variety of reasons, especially export promotion. The Japanese system of quantitative restrictions was often the subject of complaints. Though the Japanese have been liberalizing this system, restrictions still persist in certain sensitive sectors such as electronic computers, and even where quantitative restrictions have been liberalized, import licensing requirements frequently have remained. Some U.S. interests indicated that the licensing procedure in Japan is used by the government to identify end users of imported goods with a view to dissuading them from the purchase of foreign merchandise. Complaints about high duties for specific products, including jewelry, appliances, computers and alcoholic beverages, were received. Export curbs for certain products are in force in Japan. Respondents criticized Japan's "voluntary export restraints" imposed on certain

products destined for the United States and Western Europe. Steel and textiles were the items most frequently noted as subject to restraint.

#### Mexico

The most frequent complaints against Mexico concerned embargoes, licensing requirements, high import duties, miscellaneous taxes and fees, quotas, minimum or maximum price regulations, labeling requirements, restrictive business practices, and arbitrary customs valuation. The most serious barrier would appear to be the Mexican policy of embargoing imports through the denial of import licenses in cases where similar products are produced in Mexico.

#### United Kingdom

The ten leading areas of complaints against the United Kingdom involved subsidies and other governmental aids, quotas, high import duties, health and safety standards, restrictive business practices, government procurement policies, customs valuation practices, product content requirements, border tax adjustments, and the discriminatory tariff treatment resulting from the Commonwealth system of preferences.

Subsidies to the computer, shipbuilding, aircraft, heavy electrical equipment and film industries were mentioned, as was concessionary export financing for capital goods. Health and safety standards were said to impede trade in aircraft, electrical goods, motor vehicles, agricultural equipment and certain food products. Of particular concern was the CENEL scheme to harmonize United Kingdom and European standards for electronic products. Quantitative restrictions on certain electronic products and

many food items were reported. Certain U.S. producers of heavy electrical equipment complained of dumping and membership in international cartels on the part of United Kingdom producers.

#### Brazil

The principal areas of complaint against Brazil were: Miscellaneous special taxes and fees, licensing requirements, high import duties, restrictive business practices, emergency action against imports, exchange and other monetary or financial controls, customs administration problems, labeling requirements, and local content and mixing requirements.

As is often the case in less developed countries, imports into Brazil must pay a large number of special taxes, fees, and surcharges. Respondents felt that the license and documentation requirements for shipments to Brazil were too stringent, and reported that licenses usually were not granted if similar products were produced in Brazil. High duties were mentioned on a broad range of industrial products.

#### Spain

Specific limitations on imports, which include quotas, embargoes and licensing practices, were indicated as important barriers to trade with Spain. Motion picture films, textiles, chemicals, leather products, poultry, certain pharmaceuticals, and jewelry were named as particularly affected by these restrictions. The other leading areas of complaints were border tax adjustments, high import duties, state trading and government monopolies, subsidies and other aids, documentation requirements, and local content and mixing requirements.

Argentina

High Argentine tariffs were reported by many U.S. producers to inhibit their exports to Argentina. Embargoes or measures with the effect of an embargo apply to certain alcoholic beverages, some chemical products and numerous manufactured articles. Imports are also subject to a large number of special taxes and surcharges. The other major areas of complaints against Argentina were the requirement of prior import deposits, consular formalities, licensing practices, exchange and other monetary or financial controls, local content and mixing requirements, and excessive documentation requirements.

Canada

Canadian tariff rates were the subject of the greatest number of complaints against that country. Industrial products were most often mentioned as being affected by the level of the Canadian duties, and a number of the respondents were especially concerned when the U.S. duty on a given product was lower than the Canadian duty. The manufacturers sales tax of 12 percent, which is imposed on imports at the border, was said to impede trade in a variety of products. Several U.S. producers felt that the use of "fair market value" as a basis for assessment of duty did not take volume discounts or realistic wholesale prices into account and consequently overvalued goods for duty purposes. Provincial monopolies on the distribution of most alcoholic beverages were notified, as were embargoes on used aircraft and automobiles and the manner in which Canada enforces its antidumping statutes. Labeling requirements in Canada, especially for dual

French-English labels, were often mentioned in complaints, and the discriminatory tariff treatment from the Commonwealth preference system drew several objections.

### Australia

The barrier most often mentioned in complaints against Australia was high import duties. Products noted in these complaints varied from beer to computers, but most were industrial items. Health and other standards were reported to present a barrier to trade in agricultural products, such as seeds, tomatoes, poultry, and meat. Antidumping practices of Australia drew several complaints, and subsidies or other aids were said to impede trade in automobiles, paper and a number of other industrial products. Other major areas of complaints were the Australian sales tax and numerous special taxes and fees, customs valuation practices, tariff discrimination under the Commonwealth preference system, documentation requirements, certain practices in the classification of goods for duty purposes, and labeling requirements.

### Sector Review

About 80 percent of the complaints submitted in the Commission's survey of trade barriers were concerned with practices affecting industrial products, and 20 percent with agricultural products--a division that roughly corresponds to the distribution of U.S. trade.

The ten product sectors most frequently mentioned in the trade barrier complaints were:

1. Transport equipment
2. Chemicals
3. Nonelectrical machinery
4. Electrical machines and apparatus
5. Ores, metals and metal manufactures
6. Beverages and spirits
7. Foodstuffs
8. Textiles
9. Coal, petroleum, natural gas
10. Photographic and cinematographic supplies

The principal categories of complaints under each sector are briefly summarized in the following pages.

#### Transport equipment

In virtually every country of the world automobiles are subject to a number of taxes and special fees, many of which are frequently substantial, and in some developing countries even exceed the purchase price of the vehicle. Using the number of complaints as an index, it appears that trade in transport equipment is most hindered by these taxes, fees and other special charges, which are frequently levied at the border upon importation. The other major areas of complaint were licensing, quotas, embargoes, and tariffs. Notifications were received concerning barriers in force in almost every country. Approximately two-thirds of the complaints dealt with barriers in developing countries, with the following countries mentioned most often: Argentina, Brazil, Chile, Iran, Mexico, Spain, and Turkey. Japan, the United States, France, the United Kingdom, Canada, Sweden and Switzerland were the developed countries most often cited as imposing barriers to trade in the transport equipment sector.

### Chemicals

The major obstacles to trade in chemicals were reported as licensing practices, discriminatory tariff treatment, high tariffs, embargoes, and quotas. Both developed and less developed countries were the subject of complaints, with Colombia, Brazil, Mexico, Spain, Greece and Argentina heading the list of less developed countries; and the United States, Japan, the United Kingdom, France, Italy and Australia being the most frequently mentioned developed countries.

### Nonelectrical machinery

Subsidies and other aids to domestic production or exports, licensing practices, tariffs, embargoes, and government procurement practices were the barriers most often mentioned in notifications concerning products in the nonelectrical machinery sector. Approximately 55 percent of the notifications discussed barriers imposed by the industrialized countries and the remainder dealt with difficulties in developing nations. Among developed countries, Japan, the United States, France, West Germany, the United Kingdom, and Australia were the most frequently mentioned. Many complaints were made against practices in Argentina, Brazil, Colombia, Mexico and India.

### Electrical machines and apparatus

The principal practices reported as interfering with trade in the electrical machinery sector were subsidies and other aids to domestic production and exports, licensing, quotas, industrial and product standards, tariff, and border tax adjustments. Almost 70 percent of the notifications concerned barriers in developed countries, especially Japan, the United

Kingdom, the United States, France, and West Germany. A large number of developing countries were also the subject of complaint, including Brazil, Mexico, Spain, Colombia, and Greece.

#### Ores, metals and metal manufactures

The principal categories of complaint in the ores and metals sector were licensing practices, embargoes, tariffs, quotas, special taxes and fees, subsidies and other aids to domestic industries, and government procurement practices. Heading the list of developed countries named in complaints were the United States, the European Community (especially Italy and France), Canada, and Japan. Among the less developed countries, Mexico, Spain, Argentina, the Dominican Republic and Brazil received the most complaints.

#### Beverages and spirits

Government monopolies, tariffs, labeling and container regulations, taxes and fees, licensing, quotas, and embargoes were the practices most frequently reported as interfering with international trade in beverages and spirits. The complaints were about evenly divided between developed and developing countries. Japan, France, West Germany, the United States, the United Kingdom, Canada and Denmark were the developed countries with the greatest number of notifications, while among developing nations, Mexico, Brazil, Spain and Venezuela were most often mentioned.

#### Foodstuffs

International commerce in foodstuffs was reported to be hindered by quotas, health standards, licensing practices, labeling and container regulations, variable levies, and tariffs. Two-thirds of the complaints received for this sector mentioned barriers in developed countries,

especially the United States, Japan, the European Community and the United Kingdom. Mexico and Venezuela were the most frequently mentioned developing countries imposing barriers to trade in foodstuffs.

#### Textiles

Over half of the complaints against trade barriers in the textile sector dealt with some form of specific limitation on trade: Quotas, licensing requirements, export restraints, and embargoes. The remaining complaints were scattered throughout most of the other categories of trade barriers, with customs valuation and state trading practices being the only area with any degree of concentration. Slightly more than half of the notifications dealt with barriers in less developed countries. Japan, the United States, France, West Germany, the European Community (especially France and West Germany), the United Kingdom and Australia were the most frequently mentioned developed countries. Several complaints were lodged against Argentina, Brazil, Colombia, Mexico and India.

#### Coal, petroleum, natural gas

Quotas, licensing requirements, subsidies and other aids, embargoes, and state trading practices were the areas of principal complaint in the mineral fuels sector. The complaints were almost evenly divided between developed and developing nations. The European Community (particularly West Germany, Belgium, and France), the United States, Japan, and the United Kingdom were the developed nations drawing the largest number of complaints. Over 30 less developed countries were named, with practices in Greece, Spain, Turkey, India, Pakistan and Egypt most frequently referred to.

Photographic and cinematographic supplies

Subsidies and other aids to local motion picture production, numerous taxes and fees, licensing requirements, screen-time quotas, and other quantitative restrictions were most frequently reported as barriers to trade in photographic and cinematographic supplies. Two-thirds of the complaints were raised against practices in less developed countries, with Spain, Argentina, Brazil, the Philippines, and India most frequently named. Practically all of the developed countries except the United States were named, each being mentioned almost an equal number of times, but with some emphasis on practices in Italy, Australia, and France.

## Chapter II

## INTRODUCTION

## Forward

"What would be the consequence of the abolition of all restrictive, exclusive, and monopolizing laws, if adopted by all the nations of the earth, I pretend not to say. But while all the nations with whom we have intercourse persevere in cherishing such laws I do not know how we can do ourselves justice without introducing, with great prudence and discretion, however, some portions of the same system."

John Adams,  
President of the  
United States, 1707-1801

---

This report is in response to requests, dated April 21, 1971, by the Committee on Finance, United States Senate, and its Subcommittee on International Trade for studies and a report to the full Committee on the following:

- (1) The tariff and nontariff barriers among principal trading nations in the industrialized countries, including an analysis of the disparities in tariff treatment of similar articles of commerce by different countries and the reasons for the disparities;
- (2) The nature and extent of the tariff concessions granted in trade agreements and other international agreements to which the United States is a party by the principal trading nations in the industrialized countries.

The Tariff Commission instituted the requested studies on April 30, 1971. Notice of the studies, conducted as Investigation No. 332-66 and Investigation No. 332-67 under section 332(g) of the Tariff Act of 1930, as amended, was published in the Federal Register of May 5, 1971 (36 F.R. 8419).

Artificial barriers to trade are not new; from earliest times, they have been an important preoccupation of mankind, and examples of efforts to erect and to avoid obstructions to trade abound throughout history. In 416 B.C., Athens attempted to control all Aegean commerce in flax, pitch, wax, rope, copper and iron in order to keep this trade from reaching Macedonia. In about 407 B.C., Carthage imposed an agreement on the infant Roman state limiting Rome's trade to the Western Mediterranean, thus keeping the rich Eastern trade for the Carthaginians. The Punic Wars between Rome and Carthage beginning about 250 years later were largely over trade problems.

In medieval Europe, at virtually every highway, bridge and ford, a toll was exacted by the lord whose domain the merchant traveling to market must cross. A monastery between Paris and the sea, for example, required those journeying to town with fresh fish through its territory to allow the monks to choose what they judged to be 3 pence worth. An agent of the lord of Poissy stopped all boats loaded with wine traveling up the Seine to Paris, tasted a sample of each cask, chose any three for his lord, and took from his favorite a measure for his own use.

With hazards to trade rife, organizations such as the Hanseatic League were created to protect and promote member's trade, but like later groups of nations concerting for similar purposes, erected large trade barriers themselves.

In the 16th century, Francis Drake provided history with a colorful chapter on trade distortion. In "diverting" a fortune from Spain to England, Sir Francis drew curses from the King of Spain as the greatest obstruction

to Spain's trade with its new colonies in the Western World, but for this was knighted by the Queen of England. Early in the 19th century, the United States, as well as the major countries of Europe, paid substantial annual "gifts" to the dey of Algiers and the pasha of Tripoli for the privilege of conducting unhampered shipping and commerce in the Mediterranean.

Styles of trade barriers, as well as the justifications for them, change. The simple toll charged by the feudal lord when goods entered his territory continues to exist, albeit in a far more complex form and possibly for different reasons, as national tariffs; and the other simple devices such as port taxes, documentation taxes, consular fees, and the myriad charges found in early commerce seem to be still around today in some form; but Sir Francis Drake's style of direct confiscation, for the most part, has passed into disuse, in favor of more subtle and sophisticated, but nevertheless equally effective techniques. This report is an effort to describe the methods currently in vogue and to give some indication, where possible of their significance for U.S. trade.

### What is a Trade Barrier?

The term is so commonly used that it may seem unnecessary to ask what is a trade barrier, but the Tariff Commission's study has revealed that the concept of trade barriers varies widely among individuals and among countries.

Trade barriers elude any general fixed definition, and a definition suitable for all occasions probably cannot be devised. One that has been put forward is any measure (public or private) that causes internationally traded goods and services, or resources devoted to the production of these goods and services, to be allocated in such a way as to reduce potential real world income. <sup>1/</sup> This seems to be a theoretically perfect economic definition, but it leaves extremely indefinite boundaries for practical application. A somewhat similar and equally broad definition--"Any measure or attitude which distorts the natural course of world trade by favoring one nation over another"-- has been offered by a large organization representing U.S. manufacturers. <sup>2/</sup>

When specific trade barriers are to be identified and dealt with, it becomes necessary to add limitations or qualifications to such very broad definitions, and the type of qualification has usually depended on the particular occasion or circumstance. A frequently used qualification has

---

<sup>1/</sup> Potential real world income is that level attainable if resources and outputs are allocated in an economically efficient manner. Productive resources and goods and services are efficiently allocated if they cannot be redistributed in such a way that some individuals will be better off and none will suffer. See Robert E. Baldwin, "Nontariff Distortions of International Trade," the Brookings Institution, Washington, D.C.

<sup>2/</sup> National Association of Manufacturers, "The Many Faces of Nontariff Barriers," New York, N.Y.

been to limit the definition to government laws, regulations, policies, or practices that are intended to protect domestic producers from foreign competition or artificially stimulate exports of particular domestic products, and to exclude restrictive private business practices (even though they may have the same effect). An aspect of this qualification has sometimes been put in terms of equal market access for foreign and domestic products; and if discrimination is absent a trade barrier is not recognized to exist. 1/

Another frequent qualification has been to set aside measures imposed by governments to protect public health, morals, national security, and for other reasons unrelated to foreign competition, unless such measures are misused.

It is noteworthy that a few years ago when the contracting parties to the General Agreement on Tariffs and Trade began to compile an inventory of "nontariff" trade barriers, they took an empirical and pragmatic approach of simply identifying situations alleged to impede trade. Each country submitted a list of complaints concerning practices and policies of other countries which the complaining country felt impeded trade. There was no group attempt to define or specify the practices which would be appropriately considered barriers, and most of the lists submitted did not contain a definition. 2/

---

1/ Under this view, for example, an extremely burdensome or punitive tax would not be classified as a trade barrier if it applied indiscriminately to both domestic and imported goods.

2/ Some aspects of definition were implied by the practices included or omitted from the lists, but there are several good reasons why a definition built on the practices included in the GATT lists would be largely inadequate.

The United States set forth a definition in its submission, but at the same time an important de facto qualification to the definition was made by reporting only certain types of barriers. The following is from the introductory statement of the initial U.S. submission in the GATT nontariff barrier exercise:

By definition, a "nontariff barrier" is any action other than a tariff which restricts a flow of international trade. However, the United States submission is confined to those "nontariff barriers" which act directly on imports. It does not list measures such as subsidies and rebates, export controls, domestic price controls, marketing controls, investment restrictions, patent laws and regulations, differential shipping costs or regulations controlling remittance of earnings such as on motion picture films. Nor does it attempt to identify nongovernmental restrictive business practices. However, these measures may have a significant influence in retarding growth of international trade, equal to or exceeding the nontariff barriers applied directly to imports.

Some common principles were found in the submissions of the various countries. For example; almost all alleged barriers which were reported dealt with government practices, only a very few with practices of nongovernmental or private business organizations; most claimed intentional or de facto discrimination against the imported product; and the practices reported were largely confined to the area of GATT "competence" (matters chiefly dealt with in other international organizations, such as monetary problems or discriminatory shipping rates, were given little attention).

The Commission's experience in the present investigation in identifying trade barriers leads to the conclusion that in practical usage a trade barrier is simply some undesirable or unacceptable constraint upon the international exchange of goods, and that the constraints which are considered

not "acceptable"--and consequently likely to be regarded as posing an objectionable trade barrier--and the constraints which are "acceptable" depend very largely upon the point of view of the individual involved, as well as the political, economic, and social context in which the question is being considered, and the particular time at which the question is raised. 1/

In soliciting information from U.S. traders on their encounters with trade barriers, the Tariff Commission cited for illustrative purposes a number of practices commonly viewed as such. The export manager of a large and successful producer of refrigeration equipment responded to the Commission's inquiry as follows: "Most of what the Tariff Commission classifies as restrictions, we would consider as necessary matters to do business abroad. However, as you have asked and have classified them so, herewith is a list of countries where we encounter such practices." In contrast to this attitude was the not uncommon complaint received from several producers and exporters that a requirement that products be labeled in a language used in the country in which the products are to be sold constitutes a barrier to trade.

---

1/ A trade official in a centrally-planned socialist economy, for example, would give an entirely different definition of trade barriers than a businessman in the United States. A businessman in Western Europe would find acceptable and "normal" constraints which his counterpart in the United States would not, and vice versa; and the viewpoint of the businessman in Japan would probably differ from both his American and European counterparts. Moreover, the views of all are likely to change over time. For example, U.S. producers today accept almost without question numerous governmental regulations and controls upon the quality, design, or content of their products which only thirty years ago would have been looked upon as gross and unnecessary governmental interference; but while the American producer accepts these controls, the producer in a foreign country whose government has not yet imposed such regulations in all likelihood will regard them as a trade barrier.

The kinds of practices which may place a constraint upon a firm's trading operations are almost numberless. A large aircraft manufacturer, for example, found its exports of certain sizes of airplanes depended upon such factors as the number of daily landings the Japanese Government would permit a German airline to make at Tokyo. Many U.S. firms reported dock strikes as the most damaging trade barrier which they encounter. The requirement in certain Middle East countries that imported poultry be certified as having been slaughtered in accordance with the Moslem law was reported to interfere with U.S. trade; and a U.S. importer found the government publication of wholesale prices of fish in an important U.S. market to be a barrier to his importation of fish on the grounds that it prompted his foreign suppliers to demand higher prices.

It is clear from the public submissions in the Commission's investigation that businessmen and traders generally regard as "barriers" to their own trade virtually any policy, action or arrangement--whether governmental or nongovernmental and regardless of purpose--which increases the cost of delivering their product in a market, or lowers their competitor's cost, or otherwise in any manner lessens their ability to compete and sell. In these submissions, there was little or no concern with whether the practice was one by the government or by a nongovernmental body (e.g., cartel arrangements among foreign producers), and numerous complaints did not involve any element of actual discrimination or even implied discrimination against the imported product (e.g., Canada's 12 percent manufacturers sales tax which, for imports, is collected at the border).

### The classification of trade barriers

Over the past decade as public attention has been given increasingly to the innumerable practices which may affect or impinge upon the free flow of trade, various people and groups dealing with trade barriers have usually set up rather loosely defined categories into which the numerous practices could be classified.

Given the basic definitional problem already discussed in the foregoing pages, it is obvious that any classification system would have to be more or less arbitrary, rather imprecise, and have a number of deficiencies. The differentiation between *tariff* and *nontariff* barriers which is now commonly used is a good illustration. There are three principal elements in every country's tariff system, all of which are important in determining the amount of duty collected on a product. These are the rate of duty, the system by which imports are valued for the assessment of ad valorem rates, and the tariff nomenclature, or classification system of differentiating products for duty purposes. In addition to these three basic elements which are intimately related to the amount of duty collected, other aspects of a country's customs system bear upon the cost of importing goods. Examples include the documentation required for customs clearance, the complexity of the administrative system, and simply the time required for customs clearance.

It would seem, therefore, that *tariff barriers* should be defined as the customs duty, the valuation system, the nomenclature, and possibly some other related practices. However, in complaints which were submitted by the GATT contracting parties when they were compiling their initial

inventory of *nontariff* trade barriers, almost the only aspect of tariffs not reported as a *nontariff* trade barrier was the rate of duty itself.

In GATT discussions many years ago there was some puzzlement as to how to characterize or label the various tariff related measures that lie between the rate of duty itself and the outermost peripheral administrative requirements related to the collection of duties. Ten or fifteen years ago Europeans generally referred to such practices as *para-tariff* measures, meaning they were tariff related but *beyond* tariffs. More out of convenience for discussion than by intent, this distinction was gradually dropped, and by the time the Kennedy round of trade negotiations was in its later stages, everything other than the actual rate of duty itself was being characterized as a *nontariff* measure, including practices so intimately related to the amount of duty collected as the American selling price valuation system. However lamentable, in theory, this might have been, it was probably a natural development, as it followed the only definite line of demarcation that might be located in the wide gray area between *tariff* and *nontariff* barriers.

The Commission fully recognizes the inaccuracies of the distinction as it is presently made between *tariff* and *nontariff* trade barriers, but simply to facilitate the general use of the material of this report and more easily relate it to the other work which has been done, the material is arranged to conform with this popular definition, and such matters as the American selling price system of customs valuation and several other tariff related issues are discussed in the section of the report dealing with *nontariff* trade barriers.

Within the area of nontariff barriers, the material has been classified into the following major categories:

1. Nontariff charges on imports,
2. Quantitative restrictions and similar specific limitations on trade,
3. Government participation in trade,
4. Standards as technical barriers to trade,
5. Customs procedures and administrative practices, and
6. Discriminatory ocean freight rates.

### The Nature of This Report

When the present study was begun, the Commission's goal was to prepare a comprehensive report which would identify trade barriers maintained by the principal trading nations which impede U.S. exports or imports, and to assess their impact on U.S. trade.

The number of widely diverse topics which must be dealt with to cover the field of trade barriers presents several dilemmas if they are to be encompassed in a single report in some comprehensible and intelligible manner and without excessive repetition of many facts and circumstances which relate to their operation or significance. For some purposes, and for many users, a report on trade barriers would be most useful if the barriers were discussed on a product basis. On the other hand, the fact that many barriers may apply to almost all products argued for structuring the report in terms of fairly broad categories of practices, with only secondary reference to the products affected. Either way, a major problem was faced in condensing the material to digestible proportions without losing its substance and rendering it into simply an expanded version of the numerous lists of "illustrative" trade barriers which have been published on several occasions.

In an effort to strike a viable compromise, the present report has been prepared in three parts. Part I presents an overview of trade barriers and is intended to provide the reader not interested in details of the numerous practices with summary information which is still sufficiently substantial to permit some assessment of the relative importance of the

major barriers affecting trade. In Part I, this introductory statement is followed by chapter III, entitled "The Principal Determinants of Trade and the Volume and Direction of Trade Flows," which is intended to provide a general background of relevant economic information on the value and direction of trade flows in recent years in order to aid the reader in placing trade barriers in perspective with other factors affecting trade. This is followed by chapter IV discussing average tariff levels of the major trading countries in terms of fairly large aggregations of products. Chapter V discusses the extent to which average duty levels have been reduced in trade agreements, and chapter VI presents a resumé of the major nontariff trade barriers.

Parts II and III are intended to provide greater detail for the tariff and nontariff barriers treated in rather summary fashion in Part I. Part II is exclusively concerned with nontariff trade barriers, which have been grouped for discussion purposes into categories which conform roughly to those used in the work which has been done by the parties to General Agreement on Tariffs and Trade and by others who have worked in the field in recent years. Part III discusses tariffs and other trade barriers in terms of product sectors. Tariffs and trade of the major countries are compared in some detail at fairly low levels of product aggregations, and complaints received in the Commission's survey against trade barriers affecting the products are very briefly summarized.

#### Coverage of the report

An effort has been made to cover all of the significant practices which have been brought to the Commission's attention as tariff or nontariff

trade barriers. Practices or policies which have not usually been placed under the rubric of tariff and nontariff barriers, such as international monetary arrangements or national fiscal policies for the control of inflation, are not treated in the report, even though they have exerted a far greater influence on trade than many of the so-called tariff and nontariff trade barriers. <sup>1/</sup> The data for the report was assembled principally during 1972 and consequently reflects barriers in existence at that time and in the late 1960's.

The field of trade barriers can be extremely volatile at times. Some types of restrictions are rather quickly imposed or removed in an ever changing pattern as governments attempt to cope with domestic or international economic or political problems. It is inevitable that many of the barriers described in this report will have been removed or modified when the report is published, and new barriers not cataloged will have been instituted.

The period during which this report has been in preparation has been one of rapid and radical change in international trade and upheaval in the monetary world. Since the beginning of 1971, Japan has dismantled or relaxed a large number of import and other restrictions which had been a source of aggravation in U.S. trade relations with that country. The United States found itself placing a temporary surcharge on virtually all dutiable imports, and later, quotas on exports of products which it had vigorously

---

<sup>1/</sup> The inappropriate exchange rate for the dollar vis-a-vis some of the other major currencies prior to the recent series of revaluations was probably a much stronger deterrent to U.S. exports than a large part of the tariff and nontariff trade barriers discussed in this report.

promoted in foreign markets for many years. Important agreements controlling world trade in textiles were negotiated. The United States removed long-standing limitations on its imports of petroleum. In a research task of the magnitude necessary for this report it simply was not practical to continuously update the assembled information in order to reflect all of the numerous changes which have occurred in the trade barriers being cataloged. It has only been possible, through footnotes and other brief references, to draw attention to some of the major changes.

It should be noted that the changes which seem to be underway in the world economy carry some far-reaching implications for any treatment of trade barriers. The major concern in this area in the past has been, for the most part, with tariffs, import quotas and other restrictions which are intended to protect domestic industries by excluding foreign products from a market. Recent world shortages in important commodities and the turmoil which has accompanied the recent Middle East embargo on petroleum exports, as well as the U.S. limitation on exports of soybeans in 1973, have suggested that the whole nature of the problem with trade barriers may be changing, and that the major concern of the future may be access to supplies rather than access to markets.

The Commission has concentrated its attention on trade barriers in the European Community (as it was constituted prior to enlargement in 1973) <sup>1/</sup>, Japan, Canada, the United Kingdom, and the United States, and throughout

---

<sup>1/</sup> The original Community consisted of Belgium, France, Italy, Netherlands, Luxembourg, and West Germany. On January 1, 1973, the Community was enlarged to include Denmark, Ireland, and the United Kingdom.

the report these countries are frequently referred to collectively as the "five major countries." In 1973, Canada, Japan, the six nations of the original European Community, and the United Kingdom all together took 55 percent of U.S. exports and supplied 59 percent of U.S. imports. Although the Finance Committee's request was limited to tariff and nontariff barriers among principal trading nations in the industrialized countries, a great deal of information is provided on barriers found in the smaller industrialized nations and in developing countries, where the trade barriers tend to be both more numerous and intractable. Half of the complaints on trade barriers submitted to the Commission concerned practices in developing countries, and about 17 percent were against industrialized countries other than those making up the "five major countries."

Mention of the European Community and the European Free Trade Association throughout the report, unless specifically indicated otherwise, refers to those organizations as they were constituted prior to January 1, 1973, when the United Kingdom and Denmark withdrew from the EFTA and, together with Ireland, joined the European Community. Most of the statistical and other data for the report was assembled prior to this event and it was not practical to rearrange it to reflect the new situation.

#### Data sources

Data for this report were gathered from several sources. When the Tariff Commission initially announced that it was instituting a study of trade barriers imposed by principal trading countries, interested parties were urged to submit written statements relevant to the study. The

Commission several months later, on January 21, 1972, issued a second announcement stating that it was seeking to identify all procedures, regulations, or practices by governments or private organizations which had significantly distorted the normal flow of U.S. exports and imports in recent years, and to assess the impact on U.S. trade of such measures. To assist the Commission in identifying such barriers and in determining their impact on U.S. trade, the Commission solicited from all interested parties relevant information in the form of briefs, written statements, or data, including copies of relevant depositions filed with other Government agencies or with industry or trade groups acting in the field of foreign trade. <sup>1/</sup> The Commission stated in its announcement that barriers currently encountered were of principal interest for the study, but information on barriers which had been removed in the past few years, or otherwise became inoperative, was also sought. It was indicated with respect to import duties that the Commission already had extensive data on rates levied by the United States and foreign countries, but sought information on the impact of individual rates on trade in particular products.

During February and March of 1972, approximately 1,300 questionnaires were sent to selected domestic producers, importers and trade associations to specifically request identification and assessment of trade barriers encountered in their operations. Approximately half of the questionnaires went to domestic producers, one-fourth to importers and importer associations, and one-fourth to trade associations representing domestic interests. Several of the trade associations in turn distributed copies of the Commission's request and questionnaire to all of their members.

---

<sup>1/</sup> The request for briefs was published in the Federal Register (37 F.R. 1276).

As a result of these solicitations, almost 500 responses were received from the public. Domestic interests (producers, trade associations and exporters) accounted for approximately 85 percent of the responses, while the remaining 15 percent came from importers and importers trade associations.

In addition to the information received from the public, similar information was also collected from industry analysts and commodity experts on the Commission's staff and in the Departments of Commerce, Agriculture and Interior. The documentation prepared by the GATT Secretariat in connection with the GATT program for identification and discussion of non-tariff barriers was an extremely useful source of information for additional background and details on the operation of many of the practices reported to the Commission in the public submissions.

The data received from all of these sources was, of course, supplemented by additional research from numerous publications, laws, and regulations, by information from the Commission's files, and by discussions with individuals knowledgeable in particular fields.

The complaints against trade barriers which were submitted to the Commission have been counted and tabulated by class of barrier, by country, and by product sector as one possible indication or measure of the relative importance attached to the various barriers by U.S. producers and traders. In tabulating the complaints, each barrier reported by a respondent in the Commission's survey has been counted one time for each country in which the respondent reported encountering the barrier. Thus, for example, if a manufacturer stated that his shipments to countries X, Y, and Z are subject to import licenses, this was counted as three complaints. Most of the

individual submissions to the Commission concerned more than one practice and more than one country, and consequently involved several complaints. The total number of complaints against a particular practice or trade barrier may generally be taken as one indicator of the significance of the barrier, although it is recognized that there are several deficiencies in such a measure. For example, there are a few instances where trade is very large but is concentrated in relatively few firms, and consequently few complaints were submitted against barriers which are very important in the trade.

## Chapter III

THE PRINCIPAL DETERMINANTS OF TRADE AND THE  
VOLUME AND DIRECTION OF TRADE FLOWS

## Trade Barriers in Perspective

Historical growth of trade

World trade since the mid-1950's has grown at double the pace of the beginning quarter of this century, which in turn was roughly double the pace of the last quarter of the 19th century. The following figures show this marked change in the annual growth rate of world trade: 1/

<u>Years</u>	<u>Average annual growth rate</u>
1876-1896-----	1.8 percent
1896-1926-----	4.3 percent
1956-1970-----	8.2 percent

U.S. trade in this century has exhibited a comparably dramatic change in growth rates, but with noticeable differences between imports and exports. Annual average growth rates for both imports and exports have doubled but the base from which they have doubled is different. 2/

<u>Years</u>	<u>Average annual growth rate</u>	
	<u>Imports</u>	<u>Exports</u>
1900-30-----	4.4	3.4
1956-70-----	8.7	6.2

---

1/ In world trade, imports definitionally equal exports, so it makes no difference which figures are quoted; here export figures are used. For 1956-70, data are computed from United Nations Commodity Trade Statistics; for the two earlier periods, data are from P. Lamartine Yates, Forty Years of Foreign Trade, London, 1959, which in turn has been taken from League of Nations, Industrialization and Foreign Trade, 1945.

2/ Data for 1956-70 are computed from United Nations, Commodity Trade Statistics, data for 1900-1930 are computed from Bureau of the Census, Historical Statistics of the United States.

Determinants of trade

An important reason for a comprehensive examination of trade barriers is to gain some understanding of their impact and their significance in the picture of world trade. For perspective and background, a very few general observations are in order on the principal economic determinants of the volume and direction of trade flows among nations.

In summary, there are both general and particular factors in the economic determinants of trade: general - having to do with those elements which broadly affect overall trade; and particular - those elements which are individual to a country. For market economy countries, <sup>1/</sup> the principal general factors are the performance of world gross national product (GNP), the international monetary system, the diffusion of technology and the general trading climate created by commercial policies of the principal trading nations. Particular factors are to be seen in a country's own tariff schedules, and such things as its treatment of capital exports and imports. Trade barriers generally are reflections of various aspects of commercial policies of nations as they attempt to control foreign trade, investment and shipping to their particular advantage.

A country's trade performance involves important elements still not clearly understood by economists. Large market economies dominate international trade even though in relative terms foreign trade may be equal

---

<sup>1/</sup> The general comments in this chapter on determinants of trade do not apply to centrally planned economies, where trade is controlled and directed as part of an overall economic plan of the state. In centrally planned economies trade does not play the same role as in market economies.

to only a small proportion of their GNP. Conversely, small economies may have only a small role in international trade but high foreign trade/GNP ratios. Beyond saying this, economists are not yet able to offer adequate explanations as to why foreign trade ratios of particular countries are where they are, or why they change.

Commercial policy actions tend to receive far more public attention and awareness than such factors as GNP, the monetary system or the diffusion of technology, and this at times seems to create the unfortunate impression in the public mind that the volume and direction of trade flows are solely a function of commercial policy. GNP performance exerts a vital influence. Monetary exchange rates and convertibility likewise exert a profound influence on developments in international trade, and the same can be said of the manner in which governments manage internal monetary and fiscal policies and competition policy.

A country's performance in price stability relative to its trading partners vitally affects its trade performance. Prices rising domestically faster than abroad stimulate imports and dampen exports. Where domestic prices are higher than those abroad because of differences in policy on competition, there is also an impact on the country's trading performance. A country's competition policy may also affect the rate of investment which, in turn, affects GNP.

Commercial policy actions are of great importance to how trade develops, but such issues do not exhaust the factors affecting trade.

This is illustrated by the fact that notwithstanding high tariffs and an array of nontariff barriers in Japan, U.S. exports to Japan, in the 1956-70 time period, grew at double the rate of U.S. exports to the world, 12.5 percent per annum, in contrast to 5.2 percent per annum; in the 1964-70 time period, U.S. exports to Japan grew at 16 percent per annum in contrast to 8.3 percent per annum to the world.

In addition to the public policy aspects of the determinants of trade, private business arrangements--cartels, geographic division of markets through patent arrangements and other similar schemes--also affect international trade, as was recognized in the stillborn International Trade Organization intended as a companion to the IMF and IBRD, but which came to life as the General Agreement on Tariffs and Trade, where the provisions dealing with private arrangements were not incorporated.

## General Factors Determining Trade

The dynamic effect of GNP performance

For the major industrial powers, GNP growth performance has been stronger since World War II than before the war. This is seen in table 3-A, which shows GNP growth rates for the United States, Canada, France, West Germany, Italy, the United Kingdom and Japan.

Table 3-A.--International comparison of growth rates of gross national product for selected periods, 1913-1968

Period	United States		Canada		France		West Germany		Italy		United Kingdom		Japan	
	Total	Per capita	Total	Per capita	Total	Per capita	Total	Per capita	Total	Per capita	Total	Per capita	Total	Per capita

Comparison between GNP growth and growth of imports and exports for a country shows a striking relationship. For developed market economies, GNP performance is the engine of trade growth and, by far, the dominant factor affecting trade performance. High GNP growth makes for high import and export growth; low GNP growth, the opposite. Charts 3-A through 3-E graph the relationship between GNP and trade for the United States, Canada, Japan, West Germany, and the United Kingdom for 1955-70. To the extent that the growth of trade matches the growth of GNP, successive year positions fall on the 45 degree line in these charts. To the extent

that the trade data are above the line, trade is more buoyant; to the extent it is below, it is under GNP performance. While the charts show variation from country to country and between imports and exports for a single country, they clearly reveal the very strong relationship between the patterns of growth of GNP and trade. <sup>1/</sup>

United States.--For the United States (chart 3-A), the growth of imports and GNP were closely tied until 1965, when the onset of inflation in the United States began to be sharper than in trading partners, and imports began to increase at a faster rate than GNP, producing a situation which became extreme in 1968-70. United States exports, on the other hand, performed fairly closely to GNP, although somewhat below, for most years.

Canada.---Canada's imports have followed the increase in GNP fairly closely (chart 3-B), but her exports have risen markedly faster since 1965, which undoubtedly is in part a reflection of the effect of the U.S./Canadian Automotive Products Agreement signed in that year. With Canada's growing trade balance, its dollar was floated in May, 1971.

---

<sup>1/</sup> The same close relationship can be well illustrated in another manner. For comparison, reproduced as appendix chart 3-A is a chart taken from the 1971-72 Annual Report of the Bank for International Settlements showing the relationship of United States imports and GNP. The appendix chart and the charts in the text both rest on the hypothesis that the most important determinant of trade is GNP performance, but the methodology of testing that hypothesis is contrasting. The text charts compare the growth performance of trade with the growth performance of GNP by casting the absolute figures into index form. The 45 degree line is employed to show where the lines would be if the growth performance were identical. In the appendix chart showing the relationship of U.S. imports to GNP, actual dollar positions are plotted, with imports on the vertical scale and GNP on the horizontal scale. By least squares, two regression lines have then been fitted to these positions. In using one line to characterize a time period, the appendix chart de-emphasizes differences in the year-to-year relationship between imports and GNP, whereas in the methodology of the text charts, attention is called to such differences.

Japan.--For Japan (chart 3-C), imports are seen to perform noticeably below GNP between 1965-67, and still more conspicuously below in 1968-70. This pattern parallels Japan's bilateral trade balance with the United States; in 1965-67, the imbalance in Japan's favor is of the order of magnitude of earlier U.S. surpluses, but the imbalance in 1968-70 is of a much more serious nature. Japan's exports show a growth pattern strikingly similar to GNP until 1969 and 1970, when exports grew noticeably more rapidly. Part of the explanation for the contrasting deviations between GNP and trade performance for the United States and Japan is to be found in the monetary system and the relationship between U.S. and Japanese currencies. Analysts were beginning to observe as early as 1969 that Japan's trade situation might represent a basic new pattern, 1/ and the need for United States monetary realignment was clearly evident by 1971. An undervalued currency dampens imports and stimulates exports; conversely, an overvalued currency stimulates imports and handicaps exports. An additional factor in the Japan case in explaining an import growth pattern below GNP performance has undoubtedly been the

---

1/ Cf. OECD, Economic Surveys, Japan, 1969, for example, wherein it is observed (p. 39):

The main concern of the present Survey has been to examine to what extent the recent atypical behavior of the current balance of payments may mark a lasting departure from the previous pattern of developments - a question of basic importance for the future course of policy and for Japan's international economic relations. Naturally, great caution is required in any assessment of balance of payments prospects; and it is only 1-1/2 years ago that Japan was in an apparently serious external balance situation. Nevertheless, the evidence seems rather strong that the improvement of the external position is largely of a more permanent character.

number of controls on imports, a large number of which have now been removed.

West Germany.--Chart 3-D on West Germany indicates a strikingly close relationship between the pattern of GNP growth and the pattern of import and export growth until 1965, when imports and exports simultaneously become more buoyant, with exports the stronger of the two. The markedly greater buoyancy of the trade pattern led, in October 1969 to a currency realignment. (In May 1971, the mark was permitted to float.)

United Kingdom.--Chart 3-E for the United Kingdom indicates the widest deviation of trade from GNP performance of the five countries considered. Both imports and exports are characteristically below GNP.

While charts 3-A through 3-E focus on the GNP/trade relationships within each of five countries, charts 3-F and 3-G provide a comparison of GNP performance of the five countries. Chart 3-F shows GNP in current prices for 1955-70; chart 3-G is in constant prices for the 9 years, 1960-69.

Although the growth rate of GNP is the dominant factor influencing the performance of trade, it must be immediately added that trade also shapes GNP performance. Most of the time, however, the predominant influence for most countries is from GNP to trade.

#### The effect of the absolute size of GNP

Relationship of GNP size and the level of trade.--While it is the growth of GNP which dominantly shapes the growth of trade, an additional

Chart 3-F. -- Index of GNP growth (current prices) of the United States, Canada, Japan, West Germany and the United Kingdom, 1955-1970

(1955-56=100)

Computed from the following sources: For the United States, Economic Report of the President, 1971; for Canada, West Germany, and the United Kingdom, IMF, *International Financial Statistics* (for 1955-60, Jan. 1963; for 1960-65, Jan., 1967; for 1965-70, February, 1971); for Japan, Bank of Japan, *Economic Statistics Annual*, 1970 and 1971.

Chart 3-G. -- Index of GDP <sup>1/</sup> growth (constant prices) <sup>2/</sup> of the United States, Canada, Japan, West Germany and the United Kingdom, 1960-69

1960=100

<sup>1/</sup> Gross Domestic Product is a measure virtually identical with Gross National Product. GDP is defined as "the total of production attributable to factor services rendered to resident producers of a given country; GNP as the total "supplied by residents of the given country." (United Nations, *A System of National Accounts and Supporting Tables*, Studies in Methods, Series F, no. 2 rev. 2, 1964, p. 7). The two methods typically yield results which are from but a fraction of a percent to one and a fraction of a percent different.

<sup>2/</sup> The base year for the constant price calculation for each country is shown in parenthesis following the country name.

Source: Computed from UN, *Yearbook of National Accounts Statistics*, 1970.

dimension to the trade effect of GNP is its absolute size. <sup>1/</sup> Thus, it is the countries of the Organization for Economic Cooperation and Development (OECD), <sup>2/</sup> with their large GNP, which dominate the trade of the world; the United States with the largest GNP of all, is the world's largest trader.

OECD countries account for two-thirds of the world's trade; within the OECD, the United States, Canada, Japan, the European Community and the United Kingdom account for six-sevenths of this trade. For the four countries and the European Community, two-thirds of their trade is with OECD countries. Thus, it becomes apparent that world trade is not spread evenly among countries, but rather is concentrated among the large GNP nations. Further, this concentration of world trade among the wealthy of the world is increasing. The data in table 3-B clearly illustrates the more rapid growth of trade among the high GNP market economies.

---

<sup>1/</sup> The already mentioned qualification that these observations apply only to market economy countries bears repeating here. For example, the Soviet Union, with the second largest GNP in the world, has trade with the world at a fraction of what might be expected judging by market economies. In 1959, Soviet trade was at the level of France, which by 1960 had exceeded it; in 1965, Soviet trade was at the level of Japan, which by 1966 had exceeded it; in 1969, Soviet trade was at the level of Italy, which by 1970 had exceeded it.

<sup>2/</sup> OECD member countries in the years for which the basic trade data in this report are based (1969 and 1970) were as follows:

Austria	Iceland	Spain
Belgium	Ireland	Sweden
Canada	Italy	Switzerland
Denmark	Japan	Turkey
Finland	Luxembourg	United Kingdom
France	Netherlands	United States
West Germany	Norway	
Greece	Portugal	

In 1971, Australia became a member and New Zealand joined in 1973, but trade of these countries is not included in OECD trade data discussed in this report.

Table 3-B.--Proportion of world exports accounted for by developed market economies, developing market economies, and centrally planned economies, 1953, 1959, 1965, and 1969

Country groups	(Percent)

Table 3-C compares absolute levels of GNP and absolute levels of trade for selected industrial countries. It will be observed that while the United States with the highest GNP has by far the largest volume of trade, and while for the market economy countries there is a relationship between size of GNP and size of foreign trade, the relationship is far from precise and consistent.

GNP/trade ratios.--The trade of the world is largely accounted for by the high GNP countries, but there is a great diversity in the role which trade plays as a proportion of GNP in the high GNP countries. For some, trade is very high in proportion to GNP; for others, it is small. Obviously, geographically small countries are likely to have a higher GNP/trade ratio simply because transactions over only small distances are more likely to be international transactions (rather than domestic, as in the case of larger countries). Beyond saying this, however, economists do not really have a good understanding of the factors which influence these ratios at a point in time or over a period of time.

Table 3-C.--Trade of selected countries in 1959, 1965 and 1969, ranked by 1970 GNP

Source: With the exception of the U.S.S.R., GNP data are from OECD, National Accounts of OECD Countries, 1960-70, p. 10; U.S.S.R. data are from file information of the Joint Economic Committee. Trade data are from United Nations, Yearbook of International Trade Statistics, 1969, table A.

Simon Kuznets, who intensively studied changes in foreign trade ratios of some 10 countries over time, observed <sup>1/</sup> that, by "judicious combination" of numerous factors, an "explanation" could be constructed for the rising trends of foreign trade ratios for some countries and periods, the constant trends for other countries and periods, and the declining trends for still others. The difficulties and uncertainties, however, are revealed in his comments which follow:

The forces that determine trends in the foreign trade ratio...are complex and varied. To begin with, technological changes in transportation and communication, as well as new economic and institutional devices, must continuously facilitate movements across boundaries.... However, this does not necessarily mean rises in the foreign trade ratio, since the same changes also facilitate internal trade....

...Some phases in the development of the industrial structures of countries may further foreign trade more than others....Thus, when the M/manufacturing/ sector is developing more rapidly...than the S/service/ sector the foreign trade ratio may rise, other conditions being equal....

...The constellation of diverse structures of national economies, which are the units in the network of international commodity trade, changes over time....The very change in the number of independent states that become "foreign" to each other would presumably affect the volume and weight of international...trade relative to domestic....

\* \* \*

...foreign trade-flows...are affected by many complex factors, in which technological changes, social inventions, economic advantages, political revolutions, and diversities in the structures and endowment of nations all play their part; it may be that economic advantages do not play a truly dominant role (underscoring added). Consequently, there is a wide gap between the trends in

---

<sup>1/</sup> Simon Kuznets, Six Lectures on Economic Growth, Glencoe, 1959, pp. 100-106.

foreign trade observed in reality and static international trade theory.

...the second conclusion stresses the variability over time of the foreign trade ratios...the export ratio for the United Kingdom doubled in thirty years, from the mid-1850's to the mid-1880's (from 0.13 to 0.26) and then declined in a decade to about six-tenths of its peak value. These ratios are close approximations to the income propensities to import and export, widely used in model-building analysis and in projections; it is clear that these propensities which vary sensitively in the short run are also far from stable secularly.

Table 3-D provides foreign trade ratios for the 10 industrial countries listed in table 3-C. (Kuznets' historical trade ratios for selected industrial countries are reproduced in appendix table 3-A).

#### The monetary system

The world came keenly to realize during the monetary confusion of the 1930's the important role that the international monetary system plays as either an aid or handicap to trade. The convertibility of currencies and certainty or high predictability of exchange rates significantly facilitate trade; inconvertibility and uncertainty on exchange rates produce disarray and represent a serious handicap. The post World War II period has had the benefit of convertibility and a high degree of predictability of exchange rates. It is possible to say confidently that this has significantly facilitated trade, but it is difficult to specify by how much or to assign a quantitative measure.

The rigidly fixed exchange rates of the postwar period up to the recent realignments were the product of the very exceptional situation attaching to the dollar after World War II. Among the major economies of the world, the United States emerged from World War II not only

Source: With the exception of the U.S.S.R., GNP data are from OECD, National Accounts of OECD Countries, 1960-1970 (gross national product at market prices in U.S. dollars). U.S.S.R. GNP data are from file information of the Joint Economic Committee. Import and export data for 1960-61, are from United Nations Yearbook of International Trade Statistics, 1966; for 1962-69, Yearbook of International Trade Statistics, 1969; for 1970, Monthly Bulletin of Statistics, September 1971.

Note.--Imports of the countries presented are valued c.i.f. with the exception of the United States, Canada, and the U.S.S.R., whose imports are valued f.o.b. and whose ratios consequently are not fully comparable with the others.

undamaged, but greatly strengthened. Given the resultant disparity between other economies and the United States, a system of fixed exchange rates to the dollar proved viable for some two decades, but as competitive differences have narrowed over time and the dollar has weakened, it is increasingly clear that a monetary system must be devised which will compel both surplus and deficit nations to adjust exchange rates. Today a system with greater flexibility yet with predictability is being sought among the Group of Twenty. 1/

### Technology

A recent study comments: 2/

The advance in industrial techniques since the second world war has been spectacular....Activity has been channelled into 'research and development' on a scale unique in history, and many authorities believe that the advance in the application of scientific progress is tantamount with all its social and other consequences, to a second industrial revolution.

The explosion of technological output and its diffusion is credited with being a large stimulant to trade.

In some countries the new technology has quickened the pace of investment, and the increased investment has stimulated GNP. In turn, the quickened growth of GNP has increased the growth of trade. In other circumstances there has been both an investment/GNP consequence, with its indirect effect upon trade, as well as a direct effect where multinational firms have taken technology to LDC's primarily to manufacture

---

1/ Efforts since World War II to maintain a system of exchange rates which can be changed when disequilibrium occurs is discussed in Chapter VIII under "Exchange Controls and Other Monetary Barriers to Trade."

2/ "The Diffusion of New Technology, A Study of Ten Processes in Nine Countries," National Economic Review, May 1969, p. 40.

for export. The new investment in LDC's has stimulated GNP, and increased GNP has expanded trade, while at the same time the export program has directly increased trade.

#### National commercial policies

In seeking to distinguish factors responsible for the higher growth of trade in the postwar period, and thus to gain an understanding of the determinants of trade, national commercial policies obviously require study. The "beggar thy neighbor" policies pursued by most countries in the 1930's greatly exacerbated the trade effect of the depression that opened that decade. The high tariff walls and other trade barriers erected at that time were an important additional force depressing trade below the level to which it would have dropped from the universal decline in GNP alone.

Immediately after World War II, under the leadership of the United States, the General Agreement on Tariffs and Trade was created to provide a forum for negotiating tariff reductions and a resource toward rule observance in matters of commercial policy. Since 1947, there have been six "rounds" of multilateral tariff negotiations under the GATT, which have produced substantial reductions in tariffs of the major trading countries, <sup>1/</sup> and the GATT mechanism has provided the means for significant success in dismantling the war-period heritage of quantitative and other trade restrictions.

---

<sup>1/</sup> See Chapter V on the nature and extent of tariff concessions granted in trade agreements.

Customs tariffs: One indicator of commercial policy.--A country's

customs tariff is one of the more visible aspects of its commercial policy, and a good illustration of changes which occur in this area of commercial policy is found in changes in the average level of U.S. duty collections. Chart 3-H summarizes average U.S. duty levels over the past 80 years. The average levels of U.S. duty collections <sup>1/</sup> under the six earlier tariff laws (beginning with the McKinley Law of 1890 and ending with the Fordney-McCumber Law of 1922) are plotted, as are the average duty collections for every fifth year under the current Tariff Act of 1930 (Smoot-Hawley Law).

The points plotted for the McKinley Law, the Wilson Law, the Dingley Law, the Payne-Aldrich Law, the Underwood Law, and the Fordney-McCumber Law represent the average calculated for the full period for which the law was in effect. The points plotted for the Smoot-Hawley Law represent the average level of duty collections of each fifth year. Thus, differences in the average levels of the first 6 laws (most of which were in effect only a few years) and the beginning point of Smoot-Hawley (the Tariff Act of 1930) represent chiefly conscious changes in commercial policy. The decline in the average level from the beginning point of the Tariff Act of 1930 reflects a combination of commercial policy (the negotiated reduction of tariffs) and inflation, which

---

<sup>1/</sup> The average level is calculated from the ratios of total duties collected on imports to the total value of the imports. Two ratios are shown in the chart, one based on dutiable imports only, and the other using total imports.

Chart 3-H.--Average U.S. Import Duty Collections, <sup>1/</sup>1890-1970

<sup>1/</sup> Calculated as the ratio of total duties collected on imports to the value of (a) all dutiable imports and (b) total imports.

Source: U.S. Tariff Commission: "Value of U.S. Imports for Consumption, Duties Collected, and Ratio of Duties to Values, Under Specified Tariff Acts, 1888-1971."

automatically lowers the ad valorem equivalents of the very large number of specific duties found in the U.S. tariff schedule. <sup>1/</sup>

Popular wisdom suggests that since low duty rates facilitate trade they also should produce a higher proportion of imports to national income or GNP, yet a comparison of historical U.S. import ratios with historical U.S. duty levels reveals that the United States had higher import ratios when duty rate levels were higher! This is seen in table 3-E, which portrays the seemingly anomolous situation of the import ratio declining with the decline in duty rate levels and vividly points up the fact that other factors besides duty rates

Table 3-E.--Comparison of historical U.S. import ratios with average U.S. duty levels for selected periods, 1879-1953

<sup>1/</sup> The ratio of imports to national income, plus imports.

<sup>2/</sup> The average ratio is for the 1884-1890 period.

Source: Import ratios are from Kuznets, Six Lectures on Economic Growth, Glencoe, 1959. Duty ratios are calculated from data compiled by the Tariff Commission.

<sup>1/</sup> Difficulties in measuring tariffs in terms of averages and comparing changes in the average over time are discussed in Chapter IV. At first glance, the picture presented by chart 3-H seems to deny what one would expect--that duty rates have been substantially lowered since 1950. However, this expectation is confirmed by the convergence of the line showing the duty rate for dutiable goods and the line showing the rate for all imports. As duty rates have been lowered, the "mix" of dutiable and free imports has changed significantly. In 1945, two-thirds of U.S. imports were free; one-third dutiable. In 1971, the proportion was exactly reversed; one-third free and two-thirds dutiable.

significantly influence trade. The earliest period in table 3-E represents the beginning years of industrialization in the United States, when the country was importing much of what later it manufactured. That the import ratio for the next 3 time periods remains unchanged with declining duty rates underscores the presence of other elements in the picture.

In table 3-F the period since 1950 is presented in greater detail. <sup>1/</sup> It will be observed in table 3-F that the U.S. import ratio remained

Table 3-F.--United States imports for consumption as a percentage of GNP and as a percentage of the goods output component of GNP, selected periods 1950-59, and selected years, 1960-71 <sup>1/</sup>

Period	(In percent) <sup>2/</sup>			
	Ratio of imports to--		Ratio of duties collected to value of--	
	GNP	Goods component of GNP	Dutiable imports	All imports
1950-54-----	3.04	5.40	12.6	5.6
1955-59-----	2.94	5.56	11.7	6.3
1960-----	2.92	5.66	12.2	7.3

1968-----	3.83	7.68	11.3	7.1
1970-----	4.07	8.43	10.0	6.5
1971-----	4.34	9.19	9.2	6.1

<sup>1/</sup> Beginning in 1960, data include Alaska and Hawaii.

<sup>2/</sup> Ratios computed in current dollars.

Source: Import ratios computed from data in Statistical Abstract of the United States; duty ratios are from data compiled by the Tariff Commission.

remarkably unchanged for 10 years (1955-64). The increase in the import ratio beginning in 1966 is probably attributable more to inflation in the United States than to reductions in duty rates.

Individual items in commercial policy.--While the overall effect of a nation's commercial policy is a general factor among the determinants

---

<sup>1/</sup> The import ratios in table 3-F are calculated as proportion of GNP, and hence are not consonant with those of table 3-E.

of trade, public attention frequently focuses to such individual items as constitute the stuff of which most trade barriers are made. Examples abound, a few of which are listed below:

Concerned with competition principally from the United States, Japan and the major nations of Europe until quite recently maintained high protective duties on automobiles (ranging up to 40 percent) in order to foster an industry considered essential to the national economy.

Recently legislated U.S. duties on wool textiles range up to 106 percent ad valorem (or equivalent).

Today several major countries are encouraging national computer industries with the aid of trade barriers.

All major countries have an impressive array of restrictions on imports of agricultural products.

Fearful of competition in cotton textiles from Japan, the United States led the major consuming nations to an agreement to limit international trade in cotton textiles (and thereby unintentionally produced a surge in trade in manmade-fiber textiles, largely from unexpected sources).

The United States uses an unusual method of customs valuation for certain chemicals and rubber-soled canvas footwear which greatly increases the protection otherwise bestowed by the tariff.

## The Volume and Direction of Trade Flows

The concentration of trade

Leading trading nations.--World trade is overwhelmingly concentrated among the major market economies--all of which are located in the temperate zone, all of which are highly industrialized with fairly comparable technology, and all of which (except Japan) have manufactured goods as their leading exports and imports. <sup>1/</sup>

As observed above, two-thirds of the trade of the world is accounted for by OECD countries; within the OECD some six-sevenths is accounted for by Canada, the United States, Japan, the European Community, <sup>2/</sup> and the United Kingdom. Chart 3-I, which portrays the distribution of world trade between OECD and non-OECD countries, and among the leading OECD members, clearly illustrates the uneven distribution of world trade among countries and the pattern of concentration.

This concentration among the major (market) industrial powers is further demonstrated in chart 3-J, which shows the percentage of trade by Canada, the United States, Japan, the European Community, and the United Kingdom with developed market economies, developing countries, and centrally planned economies. The major portion of each country's

---

<sup>1/</sup> Japan is the most resource poor of the major economies. On the import side, in 1968, only 27 percent of Japan's imports were manufactures; in 1970, 30 percent. As would be expected, manufactures are the overwhelming part of Japan's exports (95 percent in 1970).

<sup>2/</sup> Throughout this report, references to the European Community, unless otherwise specified, are to the Community as constituted of six countries prior to January 1, 1973, (at which time the United Kingdom, Denmark and Ireland became members).

Chart 3-1. --OECD trade as a proportion of world trade; leading OECD member trade as a proportion of OECD trade, 1969

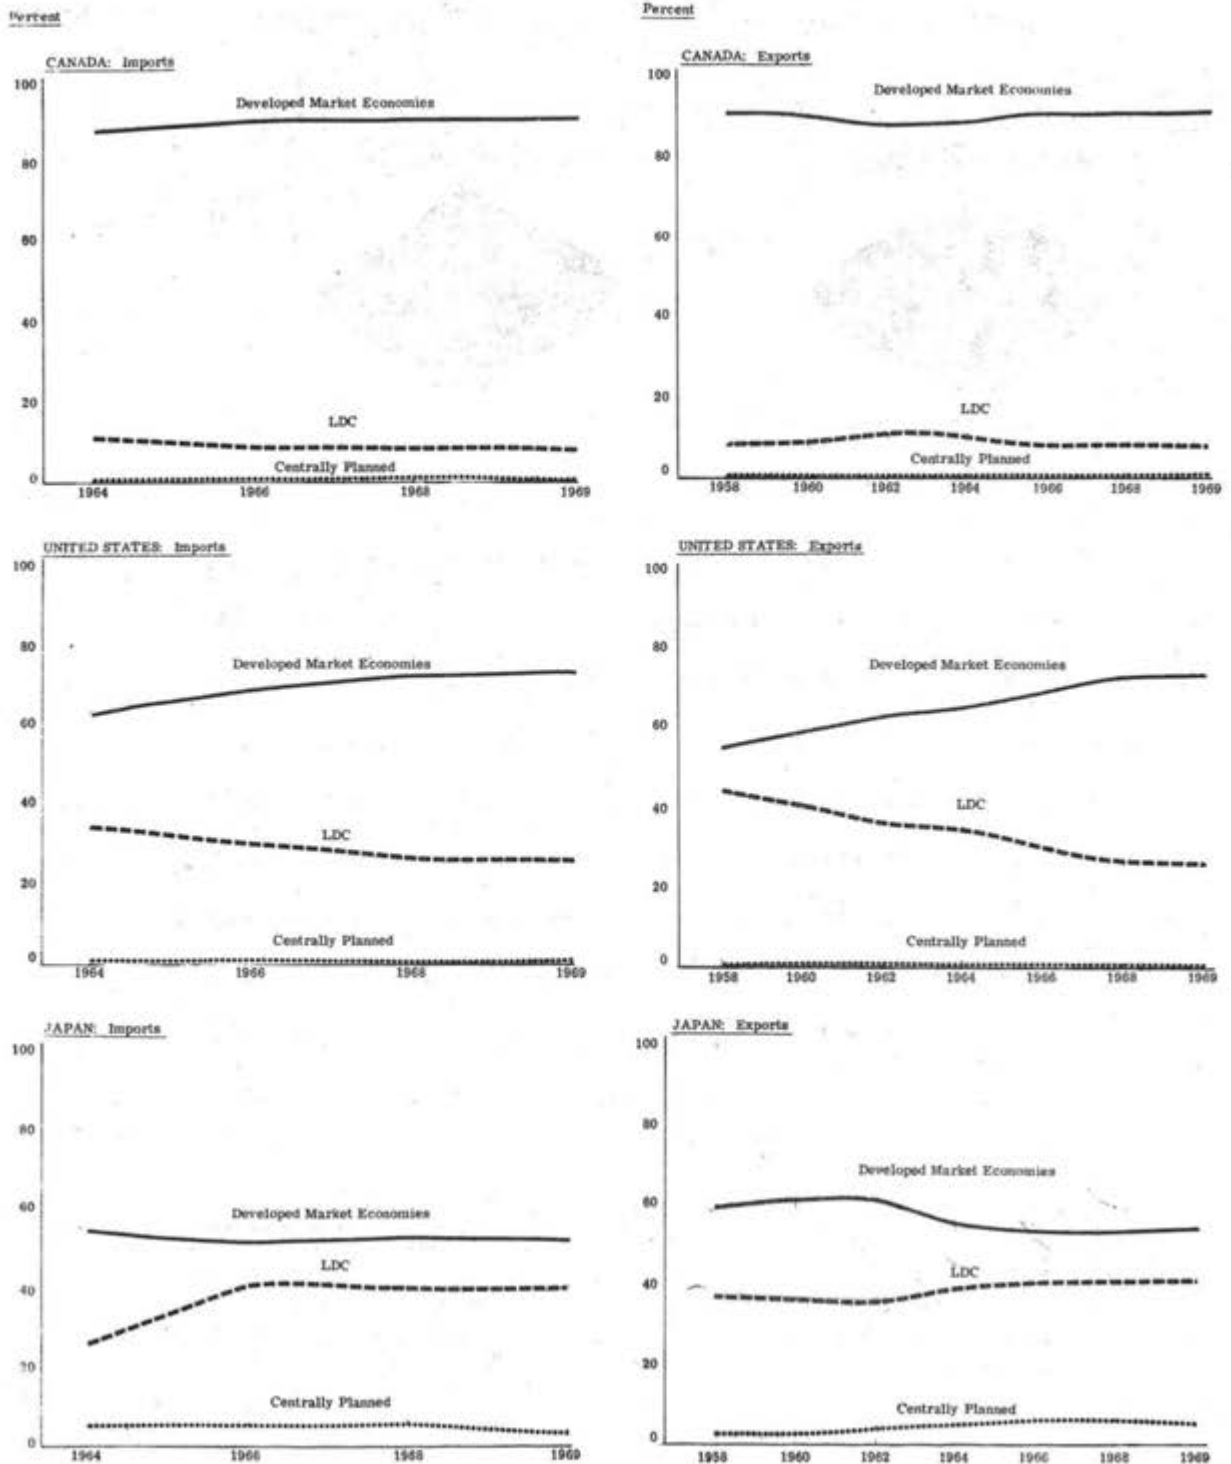

Source: OECD, *Statistics of Foreign Trade*, Series C, 1969.

trade is seen to be with the developed countries. Canadian trade is seen from the chart to be most exceptionally oriented to developed market economies; the United States trade with developed market economies is increasing; Japanese trade, although principally with developed countries, shows far greater imports and exports to LDC's than in the case of the other four countries; the European Community, notwithstanding special trading arrangements with LDC's, shows only a small proportion of trade with these countries. <sup>1/</sup> The United Kingdom's trading role with the LDC's is seen to be greater than the EC's role with these countries. For all five countries, <sup>2/</sup> trade with centrally

<sup>1/</sup> The proportion, however, is significantly greater in relation to EC external trade alone, net of intra-EC shipments.

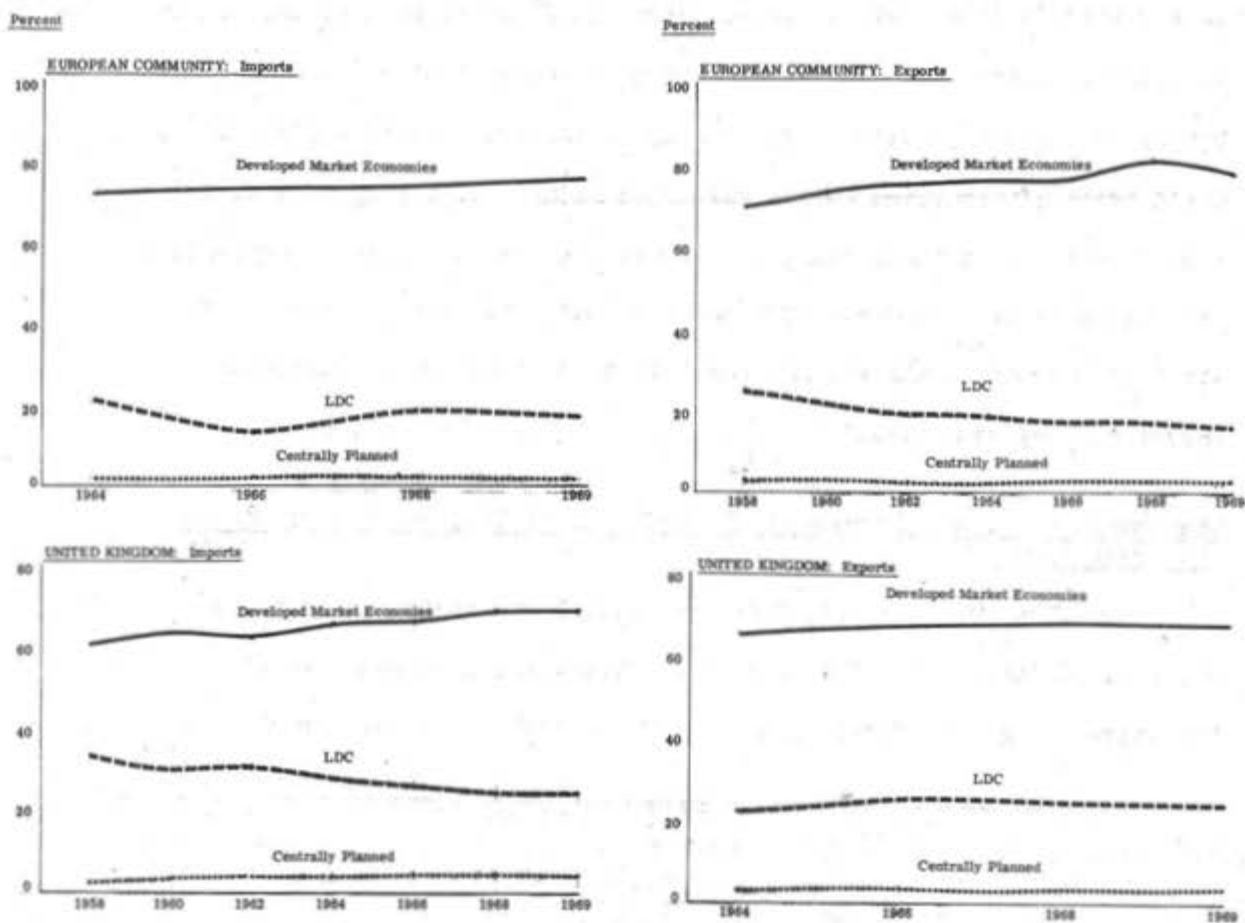

<sup>2/</sup> In this report, for brevity, the European Community, which consisted of six nations at the time most of the data on which this report is based were assembled, is frequently referred to as a "country."

Chart 3-J.--Distribution of trade of Canada, United States, Japan, the European Community and the United Kingdom among developed market economies, developing countries, and centrally planned economies, in selected years

(Continued on the following page)

Chart 3-J.--Distribution of trade of Canada, United States, Japan, the European Community and the United Kingdom among developed market economies, developing countries, and centrally planned economies, in selected years--Continued

Source: Imports are from OECD, *Statistics of Foreign Trade*, 1964, 1966, 1968, 1969; exports are from UN, *Yearbook of International Trade Statistics*, 1968.

planned economies is a very small portion of the total. 1/

Because one might assume that population size may have some bearing on a country's importance in world trade, it is worthwhile at this point to note the contrast between the pattern of world trade and the distribution of world population. As already indicated, over two-thirds of world trade is accounted for by developed market economy countries, and some 85 percent of their trade is concentrated in the European Community, the United States, Canada, Japan and the United Kingdom. However, only about 18 percent of the world's population is found in the developed market economy countries. 2/

The absolute volume of trade of the major countries, and the direction of trade flows

Throughout this report, attention will be concentrated on trade barriers of Canada, the United States, Japan, the European Community and the United Kingdom. Total trade of each of these countries in 1970 is

---

1/ The low proportion of United States trade with centrally planned economies might at first be ascribed to the fact that imports from those countries must surmount the high statutory rates of the Tariff Act of 1930; however, the European Community (as well as a large number of other countries) accords centrally planned economies MFN treatment, and even so, trade with those countries remains very low.

2/ The 1970 world population of 3.6 billion was distributed as follows:

	<u>Millions</u>		<u>Millions</u>
<u>Developing market economies, total-----</u>	<u>1,714</u>	<u>Developed market economies, total-----</u>	<u>648</u>
Asia-----	1,125	Europe-----	283

shown in chart 3-K, where it will be seen that external trade of the European Community is only slightly larger than U.S. trade, but that intra-EC shipments are virtually as great as the six member countries' total trade with the outside world. Japan's trade is slightly less than half that of the United States, a little larger than Canada's and about the same as the United Kingdom's. <sup>1/</sup>

Chart 3-L.--Geographic distribution of trade of Canada, the United States, Japan, the European Community and the United Kingdom in 1969

(Continued on next page)

Chart 3-L.--Geographic distribution of trade of Canada, the United States, Japan, the European Community and the United Kingdom in 1969--Continued

Chart 3-L.--Geographic distribution of trade of Canada, the United States, Japan, the European Community and the United Kingdom in 1969--Continued

Canada.--From these tables and the chart, one sees the extraordinary position of the U.S. economy for Canada, both in imports and exports. Canada's imports from the United States are some 20 times greater than imports from Japan. Canada's trade with the United Kingdom is but a fraction of its trade with the United States, underscoring that trade patterns are more than the product of duty rates. 1/

United States.--The chart for the United States makes clear the concentration of American trade with Canada, Japan, the European Community and the United Kingdom. U.S. trade with the whole continent of "LDC-Americas" is less than with the European Community, but it should be noted that LDC's as a group account for almost one-third of U.S. imports and receive two-fifths of U.S. exports.

Japan.--The data for Japan underscore the heavy dependence of Japan on trade with the United States and make clear the number of problems which Japan has out of imbalances with individual countries or country groups. In economic terms, a country's balance of trade and balance of payments with the world is most important, but where trade is quite imbalanced with individual countries, complicating political factors frequently arise. The proportion of Japan's trade with centrally planned

---

1/ Under the Ottawa Conference of 1932, Canada has applied--and continues to apply--Commonwealth preferential tariff rates to products of the United Kingdom.

economies is somewhat higher than is that of the United Kingdom and considerably higher than that of Canada and the United States which is particularly low.

European Community.--In the EC data, one notes the overwhelming importance of intra-EC trade and that trade with other countries and groups is small by comparison. However, of all other countries and groups shown, the United States is overwhelmingly the most important single external trading partner of the Community (but nevertheless much less important than LDC's as a group).

United Kingdom.--The United Kingdom chart shows the great importance of its trade with the European Community which, as of 1973, it has joined. The chart also makes clear the strong economic ties which have underlain the special relationship between the United Kingdom and the United States. As in the Japan chart, trade with centrally planned economies is seen to be considerably greater than for Canada, the United States or the Community.

#### The composition of trade

In the subsequent chapters of this report much of the data are presented in terms of "industrial" products or "agricultural" products, 1/

---

1/ For convenience in making international comparisons, and because much of the data available for this report had been so assembled, the differentiation between industrial and agricultural products used in this report conforms to that which has become common in international tariff and trade discussions in recent years. Agricultural products are those described in chapters 1-24 of the Brussels Tariff Nomenclature, industrial products in chapters 25-99. This division differs in some noteworthy respects from other classifications with which the reader may be more familiar. For example, fishery and forestry products are included under the general rubric of the agricultural sector, mining products in the industrial sector; alcoholic beverages are an agricultural product (not, as sometimes classified, an industrial item); raw cotton, wool and other natural fibers are industrial raw materials, not in the agricultural sector.

and within each of these areas to "product sectors" which typically consist of several 4-digit BTN headings. 1/ Industrial products (I) have been grouped into 23 sectors in descending order of importance of OECD 1969 exports and agricultural products (A) into 9 sectors, in descending order of OECD 1969 exports. Thus, sector I-1, nonelectrical machinery, had the largest value of OECD exports in the industrial area in 1969, sector A-1, foodstuffs, the largest in the agricultural area.

#### Industrial Sectors

- I-1. Nonelectrical machinery
- I-2. Transport equipment
- I-3. Ores, metals and metal manufactures
- I-4. Chemicals
- I-5. Textiles
- I-6. Electrical machines and apparatus
- I-7. Pulp, paper and paperboard, and manufactures
- I-8. Coal, petroleum, natural gas
- I-9. Mineral products and fertilizers, ceramic products and glass
- I-10. Professional, scientific and controlling instruments, photographic apparatus, clocks and watches
- I-11. Wood and cork and manufactures
- I-12. Precious stones, precious metals and manufactures
- I-13. Rubber and rubber manufactures

---

1/ For specific coverage of each sector in terms of Brussels Tariff Nomenclature headings and Standard International Trade Classification categories, see Chapter XIII, Product Sectors: Some General Observations, which appears in this report as volume 7.

Industrial Sectors (cont.)

- I-14. Raw hides and skins, leather and furskins and manufactures
- I-15. Footwear and travel goods
- I-16. Musical instruments, sound recording or reproduction apparatus
- I-17. Firearms, ammunition, tanks and other armored fighting vehicles
- I-18. Furniture
- I-19. Toys and sporting goods
- I-20. Photographic and cinematographic supplies
- I-21. Works of art and collectors' pieces
- I-22. Office and stationery supplies
- I-23. Manufactured articles not elsewhere specified

Agricultural Sectors

- A-1. Foodstuffs 1/
- A-2. Grains
- A-3. Animals and products thereof
- A-4. Oil seeds, fats and oils, and their products
- A-5. Beverages and spirits
- A-6. Dairy products
- A-7. Fish, shellfish and products
- A-8. Tobacco
- A-9. Miscellaneous agricultural and forestry products

Economic factors in trade in industrial products are significantly different from those in the agricultural sector. Among OECD countries in 1970, trade in industrial products was six times (5.97) the value of trade in agricultural products. In the flow of manufactured goods it is product variation--or as Raymond Vernon would express it, "differences in product cycle"--quite as much if not more than price differences

---

1/ "Foodstuffs" includes principally fruits and vegetables, coffee, tea, cocoa, spices, sugar, products of the milling industry and cereal preparations.

which account for the large volume of movement. <sup>1/</sup> Although trade in agricultural products is layered in restrictions, even if these were lifted, the potential for overall growth is far less than with industrial products.

Trade potential can be analyzed in two ways: One, in terms of price elasticity; and the other, in terms of income elasticity. Price elasticity refers to the increase in demand in response to lowered prices; income elasticity refers to the increase in demand in consequence of increased income. By either measure the overall growth potential for agricultural products is less than for industrial products, because, among other reasons, satiety is reached sooner in food products than with industrial products. In addition, trade in industrial products is promoted by their susceptibility to "product differentiation" (superficial distinguishing marks) which, as Edward Chamberlin and Joan Robinson pointed out many years ago, introduces a monopolistic element and thus reduces trade. <sup>2/</sup> It is much more difficult to introduce product differentiation into agricultural products and gain a similar advantage.

Total 1970 trade in industrial products by the 5 major countries is shown in chart 3-M, and in agricultural products in chart 3-N. <sup>3/</sup>

<sup>3/</sup> Note that the two charts are on a different scale, and hence a visual comparison of the length of bars cannot be made between the two. Comparable data for 1969 are found in appendix charts 3-C and 3-D for this chapter.

Chart 3-M.-- OECD trade in industrial products, 1970

Source: Compiled from OECD Statistics of Foreign Trade, Series C, 1970.

The geographic distribution pattern of industrial trade among the five major countries is quite similar to that of total trade; the pattern for agricultural products is strikingly different in two respects--the relative size of imports compared with exports of a country, and the relationship between countries. In the industrial area, the value of a country's imports and exports are fairly close together; in agriculture, Canada and the United States follow this pattern; but there are very substantial differences between imports and exports by the European Community, the United Kingdom and Japan, all of which are large net importers. Also in agriculture, intra-EC shipments are roughly equivalent to U.S. trade in value; EC external exports are only slightly greater

than those of Canada; but imports from external sources are almost as great as combined imports of the United States, Canada, and Japan.

Chart 3-N. --OECD trade in agricultural products, 1970  
(Billions of dollars)

Source: Compiled from OECD Statistics of Foreign Trade, Series C, 1970.

The pattern of 1970 imports and exports of industrial products among the 5 major countries can be seen in tables 3-I and 3-J; the matrices for agricultural trade are shown in tables 3-K and 3-L. <sup>1/</sup>

Noting largest suppliers of industrial and agricultural products, one finds the following pattern among the five major countries. For Canada,

<sup>1/</sup> Comparable data for 1969 are found in appendix tables 3-E, 3-F, 3-G and 3-H.

Source: Compiled from OECD Statistics of Foreign Trade, Series C, 1970.

the United States is seen to be the most important supplier in both industrial and agricultural products. For the United States, Canada is the largest supplier of U.S. industrial imports, but in the agricultural area LDC's as a group provide over half of U.S. imports. For Japan, LDC's as a group (supplying principally industrial raw materials) are the chief supplier in the industrial area, and are barely surpassed by the United States in agricultural products. In the European Community, member states are the principal suppliers of each other's imports; entries from outside sources in both industry and agriculture come principally from LDC's as a group, but the United States is the largest single country outside supplier.

In exports, the largest proportion of Canada's shipments in both industry and agriculture go to the United States. For the United States,

Canada and the Community are the principal customers for U.S. industrial products, the Community and Japan for agricultural products, but in both industry and agriculture, LDC's as a group take a larger amount of U.S. exports than any one of these principal single country customers. Almost half of the European Community's industrial exports, and almost two-thirds of agricultural exports are intra-EC shipments among the member states. Other European members of OECD as a group are the largest outside market for EC industrial exports, followed by the LDC's as a group. In the agricultural area, LDC's take a slightly larger amount of EC exports than the EC's European trading partners. The United Kingdom sends 22 percent of its industrial exports to the Community and slightly more to LDC's. The United States is the United Kingdom's principal customer in the agricultural area. 1/

1/ This due largely to the inclusion of alcoholic beverages in the agricultural sector.

The differences in geographic distribution of industrial and agricultural trade (both with the relative scale of the two kinds of trade) are easily seen in table 3-M, which is in percent rather than absolute figures.

Twelve industrial sectors account for over 90 percent of OECD trade in industrial goods; in the agricultural area, five sectors account for about four-fifths of OECD imports and about three-fourths of exports. 1/ Chart 3-0 illustrates the composition of trade of each of the five countries in terms of the major sectors. 2/ Included in the chart are each country's 12 leading industrial trade items and five leading agricultural items. The chart indicates both similarities and dissimilarities in the patterns of trade. The four leading industrial items of trade are ores, metals, and metal manufactures; transport equipment; nonelectrical machinery; and coal, petroleum, and natural gas. All five countries show these among their top items of trade. Among agricultural items of trade, foodstuffs are the most important sector with grains next. The chart brings out the fact that in industrial products a

---

1/ Total OECD trade in industrial goods in 1970 amounted to \$368.6 billion; trade in 12 industrial sectors amounted to \$342.5 billion.

Total OECD imports of agricultural products in 1970 amounted to \$36.7 billion; five agricultural sectors amounted to \$29.5 billion. Total exports amounted to \$25.2 billion with five agricultural sectors amounting to \$19.0 billion.

2/ Statistical data from which chart 3-0 is constructed are found in appendix table 3-I.

1/ Data for the European Community are calculated on two bases: (1) including intra-community imports and exports, and (2) excluding such shipments. The figure in parentheses exclude intra-EC trade.

Source: Compiled from OECD Statistics of Foreign Trade, Series C, 1970.

Note.--Complete country of destination data are not available for all products covered by this table; country of destination figures therefore do not add to world totals.

country is frequently both an importer and exporter in the same sector whereas in agricultural trade, the pattern is typically "either, or." The one apparent exception to this observation is the European Community, but when intra-EC trade is disregarded, the observation largely holds here.

UNITED STATES TARIFF COMMISSION

# TRADE BARRIERS

Report to the

COMMITTEE ON FINANCE  
of the  
United States Senate

and its

SUBCOMMITTEE ON INTERNATIONAL TRADE

on Investigations 332-66 and 332-67  
Under Section 332 of the Tariff Act of 1930

VOLUME 2 OF 11

PART I. TRADE BARRIERS: AN OVERVIEW

CHAPTER IV. TARIFFS

TC Publication 665  
Washington, D. C.  
April, 1974

## SUMMARY TABLE OF CONTENTS

<u>Chapter</u>	<u>Volume</u>
I    Summary-----	1
PART I. TRADE BARRIERS: AN OVERVIEW	
II    Introduction-----	1
III    The principal determinants of trade and the volume and direction of trade flows-----	1
IV    Tariffs-----	2
V    The nature and extent of tariff concessions granted in trade agreements-----	3
VI    Nontariff trade barriers: a resumé-----	4
PART II. NONTARIFF TRADE BARRIERS	
VII    Nontariff charges on imports-----	5
VIII    Quantitative restrictions and similar specific limitations on trade-----	5
IX    Government participation in trade-----	6
X    Standards as technical barriers to trade-----	6
XI    Customs procedures and administrative practices-----	6
XII    Discriminatory ocean freight rates-----	6
PART III. PRODUCT SECTORS: TARIFFS AND OTHER TRADE BARRIERS	
XIII    Product sectors: some general observations----	7
XIV    Industrial product sectors-----	8-10
XV    Agricultural product sectors-----	11

# C O N T E N T S

## Volume 2

### CHAPTER IV. TARIFFS

	<u>Page</u>
Introduction-----	1
Problems in Comparing Tariffs-----	3
The three elements of national tariff systems-----	3
The nominal rates of duty-----	4
Ad valorem equivalents-----	5
Customs valuation-----	6
Tariff nomenclature-----	8
The deficiency of average tariff rates-----	10
Difficulties in comparing tariff schedules-----	11
Four methods of calculating tariff averages-----	12
Comparison of four tariff averages-industrial products-----	14
Degree of tariff protection-----	17
"Effective" vs. nominal tariff rates-----	18
Considerations on effective tariffs-----	20
Average Tariff Levels of Canada, the United States, Japan, the European Community and the United Kingdom-----	24
Post-Kennedy Round tariff averages-----	24
Industrial products: Overall average MFN tariff levels----	26
Average MFN industrial tariff levels by stage of manufacture-----	33
Tariff and trade profiles by stage of manufacture-----	39
Average MFN tariff levels for industrial product sectors----	46
Inter-country rank correlations for industrial product sectors-----	68
Variable levies on agricultural products-----	79
Agricultural products: Overall average MFN tariff levels-----	81
Agricultural product sectors-----	87
Average MFN tariff levels for agricultural product sectors-----	88
The effect of differences in customs valuation on average duty levels-----	101
Average Tariff Level of Other Developed Countries-----	105
Average tariffs of eight market economy countries-----	105
Average tariffs of the Soviet Union-----	106
Discriminatory Tariff Treatment-----	110
Preferential tariff agreements-----	110
The GATT statistical study of preferential trade-----	111
Influence on trade of preferential arrangements-----	113
The proliferation of preferential trading blocs-----	115

C O N T E N T S--Continued

	<u>Page</u>
Historical background of preferential agreements-----	116
United States MFN policy-----	117
Tariff Rate Disparities Among Nations-----	119
Reasons for rate differences among nations-----	119
Historical evolution of tariff schedules-----	120
The disparity question-----	123
Identifying disparities-----	124
Industrial tariff comparisons: United States and four major trading partners-----	136
Agricultural tariff comparisons: United States and four major trading partners-----	139
Possible disparities at the 4-digit BTN level-----	145
Trade Complaints Against Import Duties-----	152
Tariff complaints, by country-----	153
Tariff complaints, by product-----	154

TABLES

	<u>Page</u>
4-A.--Comparison of the relative height of industrial tariff averages calculated by four methods for five major tariffs and the "world tariff"-----	14
4-B.--Comparison of the relative height of tariff averages calculated by four methods for 119 industrial product categories for the United States and European Community tariff schedules-----	16
4-C.--Hypothetical examples of "effective" duty rates under different cost structures-----	20
4-D.--Nominal and effective tariff rates for selected U.S. industries-----	22
4-E.--MFN imports of industrial raw materials, semi-finished products and finished products by Canada, the United States, Japan, the European Community and the United Kingdom in 1970-----	34
4-F.--Industrial sectors: Average MFN rates of duty and 1970 imports of Canada, the United States, Japan the European Community and the United Kingdom-----	47
4-G.--Spearman rank correlation coefficients for four types of average duties on 23 industrial sectors of United States, Canada, the European Community, Japan, and the United Kingdom-----	70
4-H.--Spearman rank correlation coefficients for four types of average duties on 119 industrial sub-sectors of United States, Canada, the European Community, Japan, and the United Kingdom-----	71
4-I.--Ranks of country pairs of rank correlation coefficients for 10 calculations of average tariffs on industrial products-----	73
4-J.--Industrial product subsectors with the five highest arithmetic and own-trade-weighted average duties for Canada, United States, Japan, the European Community and the United Kingdom-----	77
4-K.--Industrial product subsectors with the five lowest arithmetic and own-trade-weighted average duties for Canada, United States, Japan, the European Community and the United Kingdom-----	78
4-L.--Agricultural sectors: Average MFN rates of duty and imports of Canada, the United States, Japan, the European Community and the United Kingdom-----	89
4-M.--Agricultural product subsectors with the three highest arithmetic and own-trade-weighted average duties for Canada, United States, Japan, the European Community and the United Kingdom-----	100
4-N.--Agricultural product subsectors with the three lowest arithmetic and own-trade-weighted average duties for Canada, United States, Japan, the European Community and the United Kingdom-----	102

## TABLES--Continued

	<u>Page</u>
4-O.--Average rates of duty on industrial products for selected developed countries-----	105
4-P.--Average rates of duty for agricultural product sectors for selected developed countries-----	107
4-Q.--U.S.S.R. tariff schedules: Arithmetic average rates, range of rates and number of rate lines-----	109
4-R.--Percent of imports of GATT contracting parties entered at most-favored-nation and at other rates of duty, selected years 1955-70-----	112
4-S.--Value of imports of GATT contracting parties entered at most-favored-nation and at other rates of duty, selected years 1955-70-----	112
4-T.--BTN headings where possible rate disparities may exist among <u>industrial</u> product tariffs of Canada, United States, Japan and the European Community-----	146
4-U.--BTN headings where possible rate disparities may exist among <u>agricultural</u> product tariffs of Canada, United States, Japan and the European Community-----	147
4-V.--Number of complaints made against import duties, by country-----	153
4-W.--Number of complaints made against import duties, by product sector-----	155

APPENDIX TABLES

4-A.--All industrial products: Distribution, by duty level, of MFN tariff provisions and imports-----	159
4-B.--Industrial raw materials: Distribution, by duty level, of MFN tariff provisions and imports-----	159
4-C.--Semifinished manufactures: Distribution, by duty level, of MFN tariff provisions and imports-----	160
4-D.--Finished manufactures: Distribution, by duty level, of MFN tariff provisions and imports-----	160
4-E.--All agricultural products: Distribution, by duty level, of MFN tariff provisions and imports-----	161
4-F.--Industrial sector BTN headings where possible rate disparities may exist in the Canadian tariff compared with tariffs of the European Community, United States, and Japan-----	162
4-G.--Industrial sector BTN headings where possible rate disparities may exist in the United States tariff compared with tariffs of Canada, Japan, and the European Community-----	171

APPENDIX TABLES--Continued

	<u>Page</u>
4-H.--Industrial sector BTN headings where possible rate disparities may exist in the Japanese tariff com- pared with tariffs of the European Community, United States, and Canada-----	176

## Chapter IV

### TARIFFS

#### Introduction

Customs tariffs are used for two purposes: to raise revenue for the government and/or to shield domestic industry from foreign competition. For most countries a dual role is served. Some countries actually designate certain duties in their tariff schedules as "protective" duties, others as "revenue" duties. In developing countries, customs duties usually are expected to provide a major part of government revenues; thus, extremely high tariff charges are encountered on products not produced in the country (and not likely to be produced - e.g., automobiles). In developed countries, although a large total sum of money may be collected by import duties, it nevertheless is only a small part of the government's income. To the extent there is a conscious policy in a country's tariff (and it frequently is difficult to discern that there is), the major developed countries' interest in maintaining a tariff tends to be protection of domestic industry; in developing countries, the provision of government revenue tends to be the more important of the two roles. 1/

---

1/ In 1971, the United States collected \$2.7 billion in import duties, but this was only 1.4 percent of national revenue in that year. In 1891, the \$216 million collected was 55 percent of national revenue. Customs duties provide as much as 60 percent of the national revenue of some developing countries; for the majority of LDC's the range is from approximately 20 to 50 percent.

Regardless of the purpose for which the tariff may be maintained, the effect on trade is the same, namely a misuse of the economic factors and distortion of the situation which would prevail in the absence of the tariff. The degree depends, of course, upon the amount of the duty and its relationship to the numerous other economic factors pertinent to trade in a particular product. The effect may range from one so negligible that it cannot be detected to one so great that it completely stops trade in the product.

Because one underlying reason for any comparison of national tariffs usually is to determine or measure the extent to which each country protects its domestic industry and/or impedes or distorts the "normal" flow of trade, it is necessary to strongly stress some highly important caveats which must be attached to the validity of interpretations which may be made, or conclusions which may be drawn, from the kind of tariff comparisons which are to be made in this report. These caveats, together with some basic principles to be born in mind when comparing tariffs, are set out in the following section.

## Problems in Comparing Tariffs

The three elements of national tariff systems

There are three basic elements in any country's tariff system. All are important in determining the amount of duty collected on a particular imported product, and consequently all three are important considerations when making an international comparison of tariffs for a product. They are:

(1) The nominal rates of duty, which may be stated as a percentage of the value of the product ("ad valorem" rates) or as an amount charged per unit of measure 1/ ("specific" rates) or a combination of these two ("compound" rates) ;

(2) The system of customs valuation for determining the value of imported goods against which ad valorem rates are applied; and

(3) The tariff "nomenclature", which is the classification system used to describe and differentiate products for duty purposes.

The tariff schedules of most countries have more than one set of rates. Typically each set is spoken of as a "column." In addition to a "most-favored-nation" column, countries usually have a "general" column, which is applicable to imports from sources not eligible to receive MFN or more favorable (preferential) treatment, and many countries have a "preferential" column. 2/

---

1/ Usually quantity, but other units are also used, such as size, gauge, etc.

2/ See discussion of most-favored-nation treatment in chapter III.

In comparing tariffs, once the classification of a product in the nomenclature is determined, the tendency is to look only at the nominal rate. However, the form of the rate itself and the manner in which goods are valued can be of equal or greater importance.

#### The nominal rates of duty

In comparing national tariffs, the form of the duty should also be examined. When an ad valorem rate is applied, the ratio of the amount of duty collected to the value of the goods is constant regardless of the unit price of the product. Consequently, ad valorem duties afford the least protection to domestic industries when foreign goods are cheap and the greatest protection when foreign values are high.

When a specific rate is applied, the ratio of the amount of duty collected to the value of the goods depends upon the price of the product. For any given specific rate, the ratio rises as the price of the product falls, and conversely the protective effect of a specific duty becomes constantly less as the price of the commodity on which it is levied advances. Historically, prices in all countries show a long term tendency to rise.

Over a period of time, an ad valorem rate will collect the same amount of duty in proportion to the value of the product, regardless of changes in the general level of prices, whereas a specific rate will collect a constant absolute amount of duty but the percentage of the value of the product varies as the price level changes.

A compound rate combines the effect of the ad valorem and specific forms. Theoretically, a compound rate is used (1) when it is desired to minimize the "disadvantages" of both the specific and ad valorem rates or (2) in connection with a "compensatory" duty. In the first case, the opinion that compound duties unite the "advantages" of the specific and ad valorem forms is based largely on the idea that low-valued goods will be most affected by the specific part of the rate, while the ad valorem part will equally exclude imports of high-priced goods. The use of compound rates in connection with so-called compensatory duties is illustrated in the U.S. tariff rates on wool fabrics. 1/

#### Ad valorem equivalents

Because the relationship of specific and compound rates to the value of the imported product varies with changes in the unit price, it becomes necessary for comparison purposes to convert such rates to an "ad valorem equivalent". This is an average figure, expressed as an ad valorem percentage, usually based upon the average unit value of actual imports which succeeded in entering over the duty. This step, though necessary to provide some means for comparison, is an important departure from accuracy in representing the level or significance of the tariff rate.

---

1/ The United States levies a specific rate of duty on apparel-type raw wool. In recognition of the fact that this taxation of the raw material was a burden to the domestic cloth manufacturer in competing with foreign manufacturers who had access to free wool, a "compensatory" duty was established for wool cloth which supposedly imposed an equivalent tax on the raw wool used by the foreign manufacturer. In addition to this specific duty on cloth designed to "compensate" the American manufacturer, an ad valorem rate was also charged to "protect" the manufacturer.

As an average, the ad valorem equivalent is truly representative of the specific duty only to the extent that imports in the category under consideration all had the same unit price, a situation rarely encountered. Indeed, a wide range of unit prices frequently occurs in imports in any given tariff category. 1/

#### Customs valuation

For assessing ad valorem duties, the customs valuation systems of most countries use chiefly a type of value in which the value of the product is determined at the port of entry and the value includes the cost of freight, insurance and all other charges attached to the goods up to the time of their importation (a c.i.f. system). The United States, Canada, Australia and a few other countries use a type of value in which the value of the product is determined at the point of shipment in the foreign country. It does not include freight and other charges incurred in transporting the goods to their destination (an f.o.b.--free on board--system). Obviously, for products bearing high freight costs (particularly in relation to the value of the goods themselves), the inclusion or exclusion of these charges in

---

1/ An illustration of the shortcomings inherent in the use of ad valorem equivalents of specific and compound duties (or, for that matter, any average of tariff rates) is found in the instance in which the United States in one of the multilateral GATT negotiations agreed to a duty reduction on a particular product of interest to a Caribbean country. The United States at that time applied a specific rate of duty to the product, but working on the basis of average ad valorem equivalents derived from trade data, the negotiators agreed that the new concession rate would be an ad valorem duty. When the new "concession" rate was placed in effect, strong protests immediately arose from the Caribbean producer whom it was intended to benefit. Conversion of the rate to an ad valorem duty, although based on a significant reduction in the average ad valorem equivalent of the specific rate, actually increased significantly the amount of duty which would have to be collected on U.S. imports of his product. A corrective Presidential proclamation was issued reinstating the specific form of the rate.

dutiable value significantly affects the amount of duty collected. 1/ Further, most countries use estimated values for assessing duties on non-arm's-length transactions. 2/ Many countries (particularly among the developing nations) set minimum or maximum values to be used in assessing duties on certain products, regardless of the actual price that may have been paid. Also, other valuation methods are sometimes encountered, such as the so-called American selling price system, applied by the United States to a very few products, in which the duty

1/ Later in the chapter it is pointed out that, when large aggregates of products are considered, the significance becomes relatively minor. Obviously the difference in the valuation base is a function of the distance involved. The irregular effect of shipping costs in U.S.-Japan bilateral trade is seen in the following data taken from the Bank of Japan, Economic Statistics Annual, 1969. Imports are in millions of dollars, the f.o.b.-c.i.f. relationships in percent.

	Imports from the United States		Ratios	
	f.o.b.	c.i.f.	f.o.b./c.i.f.	c.i.f./f.o.b.
1962	1,408	1,908	77.8	128.4
1964	1,894	2,337	81.0	123.4
1966	2,312	2,658	86.9	115.0
1968	2,924	3,529	82.9	120.7
1969	3,462	4,094	84.6	118.3

2/ For purposes of customs valuation, countries overwhelmingly require open-market prices. Intracompany-transfer prices are not open market and such prices frequently are adjusted for customs purposes. Such adjustments typically raise the invoice price, since the customs officers are concerned to ensure that intracorporate prices are up to the level of open-market. There is little concern if such prices are above the open-market, hence, the expression "uplift." With the growth of multinationals and increasing intracorporate trade, "uplift" is likely to become far more common than at present. Uplift explains certain significant discrepancies in bilateral trade. Since countries usually do not review export prices, the values reflected in export statistics may be a combination of open-market and intracorporate prices. Since countries usually review import prices inasmuch as they are the basis for ad valorem custom duties, the values in import statistics are more likely to reflect open-market prices since intracorporate prices among imports are adjusted to open-market.

is assessed not on the value of the imported articles but rather upon the value of a U.S.-produced competitive counterpart. 1/

#### Tariff nomenclature

Since many products may be defined in more than one way and since the duty rates and the product categories are likely to be different, the classification employed in customs tariffs may make a material difference in the duty collected. Evidence of this is the fact that U.S. importers in a recent typical year lodged some 53,000 protests in the Customs Court against the classification assigned their goods.

The international differences in product definitions and the manner in which groups of products are subdivided in the various national tariff schedules give rise to one of the principal problems in making an international comparison of tariff rates. Definitional problems arise, beginning with the individual product and continuing up through various levels of aggregation of products. 2/ Desirable

---

1/ Customs valuation is a highly complex and technical subject. The loose description provided here is only to illustrate the very important role the valuation system plays in determining the amount of duties collected. For an accurate and detailed discussion of valuation systems, see Customs Valuation, Report of the U.S. Tariff Commission to the Committee on Finance, March 1973.

2/ The divergence in definitions among national tariffs is illustrated in the handling of steel plates and sheets in the Tariff Schedules of the U.S. (TSUS) and in the European Community's Common External Tariff (CET). In the TSUS, 14 individual items are used to describe steel plates and sheets (as defined by the United States). One of these is TSUS item 608.84: Plates and sheets of iron or steel, not cut, not pressed, and not stamped to nonrectangular shapes (except as provided in item 609.17); not coated or plated with metal and not clad; not black plate; not pickled and not cold-rolled; other than alloy iron or steel. If a comparison of the 7.5 percent rate applicable to this TSUS item is to be made with the tariff of the European Community, it is revealed that the products included in TSUS item 608.84 are described in 15 line items of the EC's Common External Tariff and are subject to a variety of rates of duty.

statistical data required for certain comparisons frequently are not available since most nations tend to collect statistics on their imports in terms of product categories in their tariff schedules. The compromise out of these statistical and definitional difficulties is to compare average rate levels for product groups in aggregations of products that will be (1) as nearly comparable as possible, and (2) at as low a level of aggregation as possible.

Since all major trading nations except the United States and Canada use the Brussels Tariff Nomenclature, international comparability in product groups for most of the national tariffs exists at the level of the BTN "4-digit" heading. 1/ This level of aggregation has been used as the basic unit for constructing tariff averages which are compared in the present report. 2/ There are 1,097 BTN headings, 178 of which are in the agricultural area and 919 in the industrial area.

Using the BTN headings as "building blocks," the GATT contracting parties assembled data on tariffs on industrial products in terms of 23 major sectors and 119 subsectors. The Tariff Commission has constructed similar information in the same manner for agricultural products, creating 9 sectors and 28 subsectors.

---

1/ Below the BTN heading level comparability is only occasionally found because countries adhering to the Nomenclature Convention are free to make their own breakouts under the heading.

2/ It has, of course, been necessary to allocate U.S. and Canadian rate provisions and trade into the BTN structure.

The deficiency of average tariff rates

If the purpose of examining a tariff schedule is to gain some knowledge of the degree of protection the schedule affords domestic industries and the impact of the tariff on trade, this must be done item by item. However, because of the complexity of national tariffs, it is customary that products be grouped for purposes of comparison, though it is almost universally conceded that there is no satisfactory method for averaging rates of duty.

A simple example will underline the dilemma. For illustrative purposes, suppose an international comparison is to be made of rate levels for metallic ores, and that country X within its borders has no deposits of certain ores required for its metal industries and therefore admits these ores duty free; all other ores are subject to protective duties sufficiently high to exclude all imports. To further simplify the example, assume the country has two rate provisions for metallic ores:

Ores with no domestic production--free;  
Ores with domestic production--100 percent ad valorem

The arithmetic average of these rates--50 percent ad valorem--is truly meaningless in terms of both categories. An average weighted by import trade of the country (a common practice) eliminates the 100 percent duty which excludes all imports of the ores to which it applies (by assigning zero weight) and shows the country's "average" duty on metallic ores as free--again substantially incorrect. In an effort to get around this distortion, "world" trade is sometimes resorted to for weighting, with the hope that it is more indicative of what the relative trade importance of individual products for a country might be in the absence of tariffs.

In spite of these very major shortcomings in using averages as indicative of a country's tariffs, the use of averages is the only practical approach in making any far reaching international comparisons of tariff levels.

#### Difficulties in comparing tariff schedules

Tariff schedules are so complex that even for small groups of products they are generally compared by averaging, and when it is desirable to compare an entire tariff schedule of one country with that of another, severe difficulties present themselves in efforts to summarize their diversity. As an example, the Tariff Schedules of the United States, as of January 1, 1972, contained 6,760 tariff line rate provisions. As in any country's tariff schedule, there is a great difference in the value of goods entering the United States under different duty rate lines of the TSUS. In fact, in 1971, 90 percent of the value of U.S. imports entered under slightly fewer than 500 or less than one-tenth of the available TSUS lines. A sense of the contrast in trade importance of different rate lines is gained in noting TSUS item 308.90 (silk thread) imports of which in 1971 were valued at \$1,506, and TSUS item 608.84 (steel sheets and plates) imports of which were valued at \$399,692,383, or a difference in scale of some 265,000 to 1. TSUS item 308.90 carries a duty rate of 10 percent; item 608.84, a rate of 7.5 percent.

In describing the height of the U.S. tariff, each line might be treated equally, thus equating silk thread and steel sheets and plates, or extra weight might be given to the rates on important items of trade.

To treat each line equally is to produce an "arithmetic" average, popularly referred to as an "unweighted" average. <sup>1/</sup> On the other hand, when duty rates are weighted by the value of trade entering under them ("own-trade weights"), fresh problems emerge. "Own-trade weights" are biased in three important ways. They (1) exclude from the average duty those rates which are so high as to be prohibitive of trade, (2) they underweight high deterring duty rates, and (3) they overweight low facilitating rates. As mentioned above, this difficulty is met in part by using "world" trade weights (or, as proxy for the world, OECD trade weights). However, if a country's trade has strong individualistic features, distortions are introduced by this route.

#### Four methods of calculating tariff averages

When the GATT contracting parties set out to assemble data on the post Kennedy Round tariff levels of the larger members, they fully recognized the foregoing assortment of problems and realized that agreement among the contracting parties could never be achieved on a single type of average as the "fairest" indicator of a country's tariff level. Thus, four averages--a simple arithmetic average and three averages weighted in different ways--were calculated on MFN rates, <sup>2/</sup>

---

<sup>1/</sup> This is a misnomer in the sense that the implicit weight contained in a simple average is the number of tariff lines in the schedule; thus the average is in fact weighted by the degree of detail within the tariff schedules.

<sup>2/</sup> MFN rates occupy varying positions of importance in the tariffs of different countries. See the discussion later in this paragraph on the GATT Statistical Study of Preferential Trade.

thereby enabling each country to select an average which it presumed to best serve the purpose at hand. The four averages were:

1. A simple arithmetic average;
2. An average weighted by "world" imports; 1/
3. An average weighted by each country's own imports; and
4. Average number 3 weighted a second time by "world" imports. 1/

It is generally presumed that the simple arithmetic average (average number 1) has the strongest bias upward, since it gives equal weight to each line provision and national nomenclatures usually are more detailed in competitive product areas where higher rates are found and less detailed in noncompetitive products which frequently are duty free. The average weighted by a country's own imports (average number 3) is assumed to have the strongest bias downward because it minimizes the importance of high rates which deter trade and emphasizes the importance of large trade items which are likely to be products with lower rates of duty. The purpose of weighting is to moderate the bias of the two extremes; so presumably, averages 2 and 4 could be expected to fall between the levels of the arithmetic and own-trade-weighted averages.

---

1/ "World" imports in this instance were total imports of the 18 developed countries for which tariff data were being assembled.

# Comparison of four tariff averages--industrial products

With these generally held assumptions in mind, it is useful to examine the relative height of the four averages which have actually resulted from the GATT Tariff Study calculations. The ranks of the four averages are compared in table 4-A for all industrial products and for industrial raw materials, semifinished products and finished manufactures, with each category divided into "all products" and "dutiable products."

Table 4-A.--Comparison of the relative height of industrial tariff averages calculated by four methods for five major tariffs and the "world tariff" <sup>1/</sup>

Rank (1 = lowest average; 4, highest)	All products				Dutiable products			
	Aver-	Aver-	Aver-	Aver-	Aver-	Aver-	Aver-	Aver-
	age	age	age	age	age	age	age	age
	No. 1	No. 2	No. 3	No. 4	No. 1	No. 2	No. 3	No. 4
	All items							
1-----	-	-	5	1	-	1	-	5
2-----	-	2	1	2	-	5	-	1
3-----	-	4	-	3	2	-	4	-
4-----	6	-	-	-	4	-	2	-
	Raw materials

3-----	-	4	2	-	-	4	1	1
4-----	4	-	-	2	4	-	1	1

<sup>1/</sup> The five major tariffs compared are those of Canada, United States, Japan, the European Community, and the United Kingdom. With the addition of the "world" tariff to this group, there are six "sets" of averages (each set consisting of the 4 types of averages) at each stage of processing. Each set has been examined and the averages in each set ranked from lowest to highest. The figures in the table indicate the number of times in the six sets each average received the rank shown.

Source: Compiled from Basic Documentation for the Tariff Study, GATT

When the field is "all industrial products," the pattern of averages generally conforms with the assumption. Average No. 1 (simple arithmetic) was highest in four of the five major tariffs which are to be examined in detail in this report (Canada, United States, Japan, the European Community and the United Kingdom), and also the "world tariff," and tied for highest in the fifth major tariff. Average No. 3 (own-trade-weighted) was lowest in five observations and second lowest in one.

When the field is only "all dutiable products," however, the assumption is seen to be less valid. Average No. 1 was highest in four of the six observations, second highest in the other two. Average No. 3 held low rank for none of the tariffs, was highest for two, and second highest for the other four observations.

Additional qualifications to the general assumption are necessary as the level of aggregation moves downward. In the case of "all industrial raw materials," in four cases average No. 1 was highest, and in four cases average No. 3 was lowest; for dutiable raw materials the configuration of the two averages was identical, highest in three observations, second highest in two, and third highest in one.

Moving through semimanufactures and finished manufactures, the configuration continues to change. When the field is "all semimanufactures" and "all finished manufactures" average No. 1 continues as the highest in most instances, and No. 3 is the lowest in at least half of the cases. For dutiable semifinished products, however, averages Nos. 1 and 3 are both highest in three

instances. For dutiable finished manufactures, average No. 1 is highest in four cases, lowest in two; average No. 3 is lowest in two cases, highest in one.

Moving to lower levels of product aggregation, the assumption is seen to be even less valid. Comparisons of the relative heights of the four averages for 119 industrial product categories in the U.S. and EC tariffs are made in table 4-B. There it is seen that when

Table 4-B.--Comparison of the relative height of tariff averages calculated by four methods for 119 industrial product categories for the United States and European Community tariff schedules

(percent of 119 product sectors)									
Rank	All products				Dutiable products

4-----	26.1	21.0	13.4	39.5	17.6	20.2	16.0	46.2	
Total--	100.0	100.0	100.0	100.0	100.0	100.0	100.0	100.0	

Source: Compiled from Basic Documentation for the Tariff Study, GATT.

Note: Due to rounding, percents may not add to 100.

the field is all products for the U.S. tariff, average No. 1 ranked highest for only 40 percent of the 119 product groups, and was actually the lowest average in about 20 percent of the cases. Average No. 3 for the U.S. tariff was somewhat truer to the assumption in that for slightly more than half of the product groups it was the lowest average, but was the highest average in 15

percent of the groups. The tariff of the European Community for all products illustrates an even greater departure from the assumed situation, however, as in about half of the product categories, average No. 1 is the lowest, rather than the highest average; and in about 40 percent of the categories average No. 4 appears as the highest of the 4 averages. The situation deviates even further from the assumed pattern when only dutiable products are concerned in the EC tariff as it is seen that for 55 percent of the product groups, average No. 1 is the lowest.

#### Degree of tariff protection

The widespread tendency to regard the absolute level of a tariff as indicative of the degree it restricts imports is a common trap when drawing conclusions from tariff comparisons. The degree of restriction actually depends upon a large number of factors. Many of these are "summed up" in the price at which the domestic industry can turn out a product, compared with the price of the foreign product.

The general notion is that the degree of tariff protection can be "read" from the height of the duty rate. Thus it would seem proper to assume that a duty rate of 10 percent in one country offers twice the degree of tariff protection of a duty rate of 5 percent applied by another country. This rests largely on the assumption that prices of domestic and foreign products are the

same. If, however, as frequently occurs, the products in question differ markedly in price, the amount of protection offered by the duty rates is not at all in proportion to these rates.

As an illustration, assume that country A produces a product at a price of \$100 per unit and country B the same product identical in every respect at a price of \$80 (and that transportation costs are disregarded). Country B can list the item duty free in its tariff schedule with fair assurance that there will be no competition to its domestic industry from imports from country A; and a minimal duty of 2 or 3 percent will almost positively insure this. Country A, on the other hand, to gain the same "degree" of protection for its industry against imports from country B, must levy a duty of 25 percent. A rate of 5 or even 10 percent would be only a slight deterrent, if any, to imports from country B, as its product would continue to undersell the country A product substantially.

#### "Effective" vs. nominal tariff rates

The hazard of falling into erroneous conclusions from a comparison of absolute tariff levels alone is further illustrated by the research of the past few years into the concept of the "effective" (as contrasted with the nominal) tariff rate.

In analyzing and comparing tariff rates, attention centered until the mid-sixties exclusively on the "nominal" rates, those listed in a country's schedules. As it frequently is the purpose of the tariff to protect domestic industry, it becomes essential

to trace through the price consequences of duty rates in detail to determine the degree of actual protection. This was first attempted in the mid-1960's, when researchers sought to define and determine "effective" rates of protection. <sup>1/</sup>

Professor Robert Baldwin has described the comparison between "nominal" and "effective" rates thusly:

"In recent years, commercial policy theory has been expanded to include a concept of protection that recognizes the effects of trade-distorting measures on intermediate inputs as well as final outputs. This "effective" rate of protection--in contrast to the familiar "nominal" rate of protection--is the maximum percentage increase in the value added by primary resources during production that is made possible by trade-distorting policies. It focuses on the protection provided primary factors--labor, land and capital--utilized in producing goods. A product's final value is the sum of these primary production costs plus the cost of intermediate inputs.

The rate of nominal protection is simply the ratio of duties collected to that final value. Effective protection on the other hand, takes into account the costs of intermediate as well as final products; the difference between the change in costs of intermediate products induced by trade-distorting measures and the change in the final value of a product caused by trade-distorting measures indicates the amount of protection afforded to the primary factors." <sup>2/</sup>

Two items of information are necessary to link tariff protection to an industry's welfare in the "effective" rate analysis.

The first is the usual assessment of the impact of duties on domestic prices. Among other things, this impact will depend upon

<sup>1/</sup> Among the pioneering studies are Giorgio Basevi, "The United States Tariff Structure: Estimates of Effective Rates of Protection of United States Industries and Industrial Labor," Review of Economics and Statistics, May 1966, pp. 147-160. (For a fuller treatment cf. writer's doctoral dissertation, International Trade Restrictions and Resource Allocation in the United States, University of Chicago, 1965); and Bela Balassa, "Tariff Protection in Industrial Countries: An Evaluation", Journal of Political Economy, December 1965, pp 573-594.

<sup>2/</sup> Baldwin, Robert E., Nontariff Distortions of International Trade, The Brookings Institution, Washington, D.C., 1970.

the degree of competitiveness in the various domestic industries. Secondly, even if the effect of the duty rates on the domestic price structure is known, it also is necessary to know the production cost structure of the industry. This is so because while duty rates may protect an industry's output price structure, duties elsewhere in the tariff schedules, or other import restrictions, may raise the industry's input cost. The effective tariff rate concept is concerned not only with the effects of tariffs on output prices but also with their effects on input costs.

#### Considerations on effective tariffs

Table 4-C shows two hypothetical industries, X and Y, with different cost structures of production. In part A of the table,

Table 4-C.--Hypothetical examples of "effective" duty rates under different cost structures

Industry	Output price	Purchased input costs	Value added = (1) - (2)	"Effective" tariff rate
	(1)	(2)	(3)	(4)
A. With no tariff protection:				
X-----	\$100	\$90	\$10	-
Y-----	100	50	50	-
B. With a 10 percent nominal tariff inducing a 10 percent output price increase:				
X-----	\$110	\$90	\$20	100% [= (20-10)/10]
Y-----	110	50	60	20% [= (60-50)/50]
C. With 10 percent nominal tariffs inducing 10 percent price increase for firm output and for input cost:				
X-----	\$110	\$99	\$11	10% [= (11-10)/10]
Y-----	110	55	55	10% [= (55-50)/50]

each product sells for \$100 in the absence of tariffs. Industry X is more of a final assembly industry than is Y; this is reflected in an input cost bill of \$90 for industry X as opposed to \$50 for industry Y. Value added, the difference between output price and input costs, is therefore \$10 in industry X and \$50 in industry Y. This value added is crucial in determining whether or not a production process is carried out, since it is the source from which profits and wages must come.

Part B of table 4-C shows how value added increases in both industries when the assumption is made that domestic output prices will increase by the full amount of the duty, in this case 10 percent. Under this assumption the products now sell for \$110, boosting value added to \$20 in industry X and \$60 in industry Y. The percentage increase in value added, or the "effective" tariff rate as the concept is normally defined, is 100 percent for industry X and only 20 percent for Y. Clearly industry X's resources (capital and labor) have benefited much more from the 10 percent ad valorem tariff than have the resources in industry Y.

Part C of table 4-C shows the situation where, in addition to the 10 percent output price increase, tariff induced price increases raise input costs by 10 percent for value added and thus both industries benefit equally.

The three main considerations that make up the picture of tariff effects, namely the "effective" tariff rate, can now be summarized. First, the effective rate tends to be higher when the nominal rate is higher. Second, the effective rate tends to be

higher than the nominal rate as the share of value added in total value becomes smaller. (This is illustrated in parts A and B of table 4-C). Finally, the tariff-induced input cost increases may offset the tariff-induced output price increase for an industry. (This is illustrated by the difference between the effective rate for industries in parts B and C of table 4-C). In some cases it may even be possible for the tariff-induced increase in input costs to more than offset output price increases so that the resulting "effective" tariff rate may be negative (i.e. conducive to imports).

Table 4-D gives some examples of various nominal and effective tariff rates for U.S. industries presented in a study by Professor Robert Baldwin. A wide range of possible relationships

Table 4-D.--Nominal and effective tariff rates for selected U.S. industries

Industry	: Nominal : Effective	
	: tariff rate: rate 1/	
	Percent	Percent
"Miscellaneous" electrical machinery, equipment and supplies-----	8	17
Primary nonferrous metal manufacturing-----	2	2
Livestock and livestock products-----	6	2
"Miscellaneous" textile goods and floor coverings---	4	-12

1/ Reflects the net effect of all trade-distorting measures (tariff and nontariff).

Source: R.E. Baldwin, Nontariff Distortions of International Trade, Brookings Institution, Washington, D.C., 1970, pp. 163-64.

is shown between the nominal and effective rates. The electrical machinery example shows the most prevalent type of case observed, where, because of the industry cost structure and the greater protection to output than to inputs, the effective rate is much larger than the nominal rate. The primary metal sector illustrates the case where protection for outputs and inputs combines to leave the nominal and effective rates equal.

The livestock sector shows a situation where some of the nominal protection is offset by increased input costs arising from protection elsewhere in the economy. In this situation the effective rate is less than the nominal rate. The miscellaneous textile sector shows this effect to an extreme degree. Here the effective rate is -12 percent while the nominal rate is a +4 percent. Thus, when all of the duty rates are considered, rather than being helped, as the 4 percent nominal rate would seem to indicate, this portion of the textile sector is actually harmed. Resources in this sector receive 12 percent less for their efforts per unit of output than they would receive were there no tariff protection.

In a study prepared for the Economic Council of Canada employing effective tariff rate type of analysis, it was found that Canadian protection in some instances had actually gone up rather than down in consequence of Kennedy Round cuts in nominal rates. 1/

---

1/ Prepared by Professors James R. Melvin and Bruce W. Wilkinson, the report Effective Protection in the Canadian Economy, is the first study in Canada to move beyond the concept of effective duty rates to actual calculations for a wide range of manufacturing industries.

Average Tariff Levels of Canada, the United States,  
Japan, the European Community and the United Kingdom

Post-Kennedy Round tariff averages

In the sixth multilateral tariff negotiations under the General Agreement on Tariffs and Trade (the Kennedy Round), the major trading nations, having initially sought to reduce duties by 50 percent, finally agreed on tariff reductions which would have meant a 35 percent lower average level of base year duty collections on industrial products. Much smaller reductions were made on agricultural products.

In the following pages, post-Kennedy Round average tariff levels for MFN imports of Canada, the United States, Japan, the European Community and the United Kingdom are compared. The rates of duty on which the comparison is based were scheduled to be in effect on January 1, 1972, the date on which the final stage of Kennedy Round rate reductions was to be made. 1/ The rates in large part represent the GATT "commitments" of the individual countries, i.e., the duties which they have contracted under the GATT not to exceed on imports from other parties to the agreement. 2/ Moreover, for Japan, and to a

---

1/ The United States was required by legislation to phase most Kennedy Round duty reductions in equal parts over 5 years, and this became the pattern for the Round. Subsequently, among the 5 major countries, Canada and Japan, both with strong trade surpluses with the United States, elected to complete their reductions ahead of schedule.

2/ In the industrial sector, the United States and the European Community have practically all tariff rates used in the present comparison bound under the GATT against increase. In the case of Japan and the United Kingdom, just over 90 percent of the industrial sector tariff lines are bound, but they cover only about 65 percent of MFN imports. Canada has only about three-fourths of its industrial tariff provisions bound, covering about 60 percent of MFN imports. An accurate tabulation of the GATT coverage in the agricultural sector has not been made. It is, however, somewhat less than in the industrial sector for the United States, and significantly less for the other countries.

lesser extent Canada, the January 1, 1972, rates are no longer descriptive of the levels of the tariffs actually being applied.

In efforts to cope with its growing trade surpluses, Japan in 1972 twice unilaterally cut tariffs and placed temporary rates in effect. The first such cut was on April 1, 1972, and affected, in whole or in part, some 318 of the 1,097 BTN headings. The second unilateral reduction came in November 1972, when a 20 percent cut was made in the rates then applied on 80 percent of all tariff items (most industrial items and several agricultural products). <sup>1/</sup>

Canada, in February 1973, temporarily reduced duties on a wide range of products, particularly consumer goods, by an average of 5 percentage points. The action was part of a package of economic and fiscal measures designed to stimulate the Canadian economy and to deal with the upward thrust in the cost of living; the tariff changes were not made primarily with commercial policy objectives in mind. The duty reductions covered Canadian imports valued at \$1.3 billion in 1972, roughly 10 percent of Canada's total imports and 20 percent of dutiable imports.

Moreover, beginning January 1, 1974, the United Kingdom will begin the staged alignment of its MFN tariff rates to conform to the European Community's Common External Tariff. The staged removal

---

<sup>1/</sup> This double cut has very substantially reduced rates on some products of particular interest to the United States, such as passenger automobiles. From earlier very high rates on automobiles, tariffs were reduced in May 1970, to 20 percent on small passenger cars and to 17.5 percent on large cars and for both to 10 percent in April 1971. The double unilateral cut Japan made reduced this 10 percent figure to 8 percent in April 1972 and to 6.4 percent in November 1972.

of United Kingdom duties on its trade with other members of the enlarged European Community, formerly subject to MFN treatment, began in April 1973. 1/ The entry of the United Kingdom, Denmark and Ireland into the European Community will have an undetermined effect on the EC tariff averages weighted by trade of the original six members, presented in the following pages; the EC arithmetic averages, of course, will not be affected.

The average tariff levels presented in this chapter are principally two types, a simple arithmetic average of tariff line rates and an average weighted by the country's own MFN imports. 2/ These have been selected for two reasons; first, their simplicity of concept, and second, as explained in the previous section of this chapter, they are widely presumed to represent the extremes of bias and can generally be considered indicative of the range in which the true average is found. In a few noted instances, averages additionally weighted by world trade are discussed. Unless otherwise specified, all weighted averages in this chapter are based on 1970 import data.

#### Industrial products: Overall average MFN tariff levels

Average MFN tariff rates on industrial products compositely are shown for Canada, the United States, Japan, the European

---

1/ The schedule of installments for alignment of the tariffs of the acceding countries to the Common External Tariff is as follows: 40 percent on January 1, 1974, and 20 percent each on January 1, 1975, January 1, 1976, and July 1, 1977. The schedule of installments for removing the tariffs on internal trade in the enlarged Community is as follows: 20 percent each on April 1, 1973; January 1, 1974; January 1, 1975; January 1, 1976; and July 1, 1977.

2/ Although import data for the United States and Canada are based on f.o.b. value, while the remaining countries' import data are based on c.i.f. value, it will be pointed out later in this chapter that the differences have an insignificant effect upon the weighted averages derived by using the data.

Community and the United Kingdom in chart 4-A. For each country,

Chart 4-A. --Average-MFN tariff rates on industrial products  
(Percent ad valorem)

\* Figures for Japan do not reflect unilateral reductions made in 1972 on about 94 percent of the rates of duty for industrial products. About 80 percent of the rates were reduced by 20 percent, about 2 percent were made duty-free, and about 6 percent were cut by amounts ranging from 10 to 95 percent.

Source: Compiled from Basic Documentation for the Tariff Study, GATT.

simple arithmetic and own-trade weighted MFN averages are given for all industrial products and for dutiable industrial products only. It will be seen that United States duty rates are slightly in excess of the other four countries when the universe is all industrial products; that Canada's rates are highest when only dutiable

products are considered. The European Community has the lowest average rates in both cases. 1/

Profiles of these overall averages are presented in chart 4-B which shows the distribution, by duty level, of each country's tariff lines and MFN imports. This chart provides the range of rates which make up the averages and shows the relative importance (in percent) of the various rate levels in each average. 2/ It also provides an easy comparison of the rate pattern of a country's tariff provisions with the rate pattern of its actual imports.

Canada, which from chart 4-A is seen to have the highest average tariffs on dutiable industrial products, is seen from chart 4-B also to have by far the largest proportion of duty-free tariff provisions and the largest proportion of duty-free MFN imports. The United States and the European Community have the lowest percentage of duty-free provisions for industrial products (each slightly more than 8 percent). However, 23 percent of U.S. MFN imports enter

1/ For the reader wishing to compare the relative height of national tariff schedules by the four different averages (calculated separately for "all products" and "dutiable only"), these are reproduced below from the GATT tariff study.

2/ The statistical data from which the chart is constructed are found in appendix table 4-A.

Chart 4-B. --All industrial products: Distribution, by duty level, of MFN tariff provisions and imports

<sup>1/</sup> "World" data represent the average of data for 12 developed countries plus the European Community. It is calculated on the basis of the individual country averages using as a weight the corresponding value of national MFN imports.

Source: Compiled from Basic Documentation for the Tariff Study, GATT.

Chart 4-B. --All industrial products: Distribution by duty level, of MFN tariff provisions and imports--Continued

Source: Compiled from Basic Documentation for the Tariff Study, GATT.

duty free, whereas 44 percent of the Community's MFN entries receive such treatment. In dutiable products, the rate levels with the highest concentrations when grouped in 5 percentage point categories (i.e., 0.1-5, 5.1-10) are as follows:

	<u>Rate category with--</u>	
	<u>Highest percent of tariff provisions</u>	<u>Highest percent of imports</u>
Canada	15.1-20	5.1-10
United States	5.1-10	0.1-5
Japan <sup>1/</sup>	5.1-10	10.1-15
European Community	5.1-10	5.1-10
United Kingdom	5.1-10	5.1-10

The difference in the industrial tariff patterns of the five countries can also be graphically illustrated by the cumulative distribution of each country's MFN imports by duty level. This is done in chart 4-C for the five major countries and, for comparison, for "world" imports. In this chart, a curve skewed to the left and rising sharply indicates a higher percentage of imports at low rates; to the extent the curve is skewed to the right and rises slowly, higher rates are applied to a greater proportion of imports. The "world average" performance indicates 40 percent of MFN imports entering at rates of less than 1 percent (virtually all duty free).

---

<sup>1/</sup> Does not reflect unilateral rate reductions made by Japan after the Kennedy Round.

Chart 4-C.--All industrial products: Cumulative distribution, by duty level, of MFN imports

1/ "World" data represent a cumulative distribution by duty level of imports by 12 developed countries plus the European Community.

Source: Compiled from Basic Documentation for the Tariff Study, GATT.

The curve rises from that point almost at a steady 45 degree angle, so that at the point a 15 percent duty is reached, 92 percent of total MFN imports have been accounted for. The U.S. curve starts at a much lower point (only 23 percent of United States MFN imports enter duty free) but it rises more rapidly than the world curve to the 15 percent duty level, at which point it falls slightly below world performance.

The European Community curve is quite close to the world curve up to the five percent duty level, then rises more sharply, and all EC industrial imports are accounted for by the time the 25 percent duty level is reached. The Canadian curve starts considerably higher than the world (53 percent of Canadian industrial MFN imports are duty free) but quickly--at the 5 percent rate level--drops below the world average and remains substantially below the world line for most of the curve. The same is true, but to a lesser degree, of the Japanese and the United Kingdom trade patterns. The actual percentages of MFN trade entering below selected rate levels are as follows:

<u>Duty rate</u>	<u>"World"</u>	<u>Canada</u>	<u>United States</u>	<u>Japan</u>	<u>European Community</u>	<u>United Kingdom</u>
FREE	38.4	53.4	23.0	46.1	44.2	39.6
Under 5%	57.1	55.4	58.9	53.0	58.2	44.7
Under 10%	80.7	72.2	83.0	71.4	86.5	76.6
Under 15%	92.1	83.2	89.3	94.2	96.9	94.2

Under 50%	99.9	100.0	99.9	100.0	100.0	100.0

#### Average MFN industrial tariff levels by stage of manufacture

Moving from the very general indicators represented by the overall averages for industrial tariffs, the first useful breakdown to examine is in terms of stages of manufacture. Before

discussing the tariff levels in these terms, however, the substantial differences in this respect in the composition of trade of the major countries should be noted. Table 4-E shows the relative importance of each country's MFN imports of industrial raw materials, semifinished products, and finished industrial products in 1970.

Table 4-E.--MFN imports of industrial raw materials, semifinished products and finished products by Canada, United States, Japan, the European Community, and the United Kingdom in 1970

(Value in millions of dollars)								
Country	Raw materials		Semifinished products		Finished products		Total	
	Value	Percent	Value	Percent	Value	Percent	Value	Percent
Canada, total-----	858	8.0	1,455	13.6	8,379	78.4	10,692	100.0

Source: Compiled from Basic Documentation for the Tariff Study, GATT.

Note: Figures do not add to totals shown because of rounding.

Canada exhibits the extreme case where 78 percent of industrial MFN imports are finished products; only 8 percent are raw materials. Japan is the opposite, with raw materials covering 58 percent of industrial imports, finished products only 25 percent. The United States and the United Kingdom import a smaller proportion of raw materials than the European Community and a larger proportion of finished products.

In Canada, the European Community and the United Kingdom almost all MFN imports of industrial raw materials are duty free. The United States levies a duty on products representing about half of the value of its MFN imports of raw materials and Japan, on about one-fourth. In semifinished products, a larger proportion of each country's MFN imports is dutiable than is duty free, but the percentages of individual countries vary widely. In finished products, all countries except Canada have only negligible or small portions of their MFN imports duty free. Forty-two percent of Canada's finished product MFN imports are admitted free. 1/

A general practice in national tariffs is to levy low or no duties on raw materials not produced in the country, higher duties on semifinished manufactures, and still higher duties on finished products. 2/ Average MFN tariff levels for industrial raw materials, semimanufactured industrial products, and finished industrial products are presented in charts 4-D, 4-E and 4-F, respectively. These charts indicate a fairly consistent pattern of duty rates rising with the stage of fabrication. Inasmuch as duty rates protect only the value added in production, it would be expected

---

1/ The very substantial duty-free portion for Canada is accounted for chiefly by automobiles, which Canada accords MFN duty-free entry. (The large U.S. imports of automotive products from Canada have preferential duty-free status, and hence are not included in the above data which refer only to MFN imports.)

2/ There are, of course, numerous exceptions to this pattern. The tendency is to protect local industry regardless of whether the output is a raw material or finished product. Examples of raw materials having protective tariffs include certain apparel, wool, tungsten ore, ethylene oxide and the duties and U.S. quotas (imposed in the 1950's) on lead and zinc as well as the quotas imposed until recently on petroleum, the voluntary restraint arrangement on steel, and European protection of its coal production.

on most processed or fabricated products that the "effective" duty rates (cf. discussion supra) would be above the rates depicted in these charts. However, depending on cost structures and given the substantial duties imposed on semifinished products, there are instances where protection on final products is actually negative.

In chart 4-D on industrial raw materials, when the reference

Chart 4-D. --Average MFN tariff rates on industrial raw materials  
(Percent ad valorem)

\* Figures for Japan do not reflect unilateral reductions made in 1972 in the sectors covering industrial raw materials. Nearly two-thirds of the rates of duty were reduced by 20 percent, about 8 percent of the rates were made duty-free and about one-sixth of the rates were reduced by amounts ranging from 50 percent to 73 percent; the remainder were excepted from reductions.

Source: Compiled from Basic Documentation for the Tariff Study, GATT.

is all raw materials, all averages are lower than corresponding overall averages in chart 4-A, and some are near zero. The United States is seen to have the highest arithmetic average; Japan, the highest own-trade-weighted average. The European Community has

the lowest arithmetic average; the United Kingdom the lowest own-trade-weighted average. When only dutiable raw materials are considered, Canada is highest by the arithmetic average, Japan by the weighted average. For dutiable raw materials, the European Community is lowest by either measure.

Chart 4-E deals with semifinished industrial products. In

Chart 4-E.--Average MFN tariff rates on semifinished industrial products  
(Percent ad valorem)

\* Figures for Japan do not reflect unilateral reductions made in 1972 in the sectors covering semifinished industrial products. About three-fourths of the rates of duty were reduced by 20 percent, nearly 3 percent were made duty-free, about 8 percent were reduced by amounts ranging from 21 percent to 99 percent, while the remainder were excepted from reductions.

Source: Compiled from Basic Documentation for the Tariff Study, GATT.

this chart, the United States and Japan tie for highest rates when all semifinished products are considered and the arithmetic average is employed. By the own-trade-weighted average, Canada

holds top position. By either measure, the EC average rates are lowest. In dutiable semifinished products, Canada is seen to have the highest rates by either measure, the European Community the lowest by the arithmetic average, and Japan the lowest weighted average.

Chart 4-F presents comparisons on finished industrial products. When all finished products are considered, the United States is

Chart 4-F. --Average MFN tariff rates on finished industrial products  
(Percent ad valorem)

\* Figures for Japan do not reflect unilateral reductions made in 1992 in the sectors covering finished industrial products. About 63 percent of the rates of duty were cut by 20 percent; about 13 percent were reduced by amounts ranging from 10 to 80 percent, and no change was made on about 4 percent of the classes.

Source: Compiled from Basic Documentation for the Tariff Study, GATT.

seen to have the highest rates by the arithmetic average, Japan by the own-trade-weighted average. The European Community has the lowest arithmetic average, Canada the lowest weighted average. For

dutiable finished products, Canada is seen to have the highest rates by either measure; the European Community the lowest rates by either measure.

If ranks of 1 through 5 (1, lowest; 5, highest) are assigned to countries within each set of average tariff levels which have been given for raw materials, semimanufactures and finished products (charts 4-D, 4-E and 4-F), the European Community is seen to hold the lowest average tariff level in 9 out of the 12 sets, and the second lowest in the remaining 3 sets. Canada has the largest number of "highest tariff" rankings. The number of times each country received each of the ranks is as follows:

<u>Rank</u>	<u>Canada</u>	<u>United States</u>	<u>Japan</u>	<u>European Community</u>	<u>United Kingdom</u>
1 (lowest average)	1	0	1	9	1
2	2	3	2	3	2
3	2	1	3	0	6
4	1	5	3	0	3
5 (highest average)	6	3	3	0	0

#### Tariff and trade profiles by stage of manufacture

The tariff and trade profiles presented in charts 4-G, 4-H and 4-I assist in interpreting and comparing the average duties by stages of manufacture. <sup>1/</sup> It is seen from the profiles on raw materials (chart 4-G) that all countries have MFN rate provisions extending into the 15.1-20 percent ad valorem range (Canada, the United States, Japan and the United Kingdom go higher). The dutiable provisions and dutiable MFN imports are concentrated in the 0.1-5 percent ad valorem bracket, except for Japan, where almost all dutiable raw material imports are in the 10.1-15 percent bracket.

---

<sup>1/</sup> The statistical data from which charts 4-G, 4-H and 4-I are constructed is found in appendix tables 4-B, 4-C and 4-D, respectively.

Chart 4-G.--Industrial raw materials: Distribution, by duty level, of MFN tariff provisions and imports

1/ "World" data represent the average of data for 12 developed countries plus the European Community. It is calculated on the basis of the individual country averages using as a weight the corresponding value of national MFN imports.

Source: Compiled from Basic Documentation for the Tariff Study, GATT.

Chart 4-G. --Industrial raw materials: Distribution, by duty level, of MFN tariff provisions and imports--Continued

Source: Compiled from Basic Documentation for the Tariff Study, ATF.

Chart 4-H. --Semifinished industrial products: Distribution, by duty level, of MFN tariff provisions and imports

1/ "World" data represent the average of data for 12 developed countries plus the European Community. It is calculated on the basis of the individual country averages using as a weight the corresponding value of national MFN imports.

Source: Compiled from Basic Documentation for the Tariff Study, GATT.

Chart 4-H. --Semifinished industrial products: Distribution, by duty level, of MFN tariff provisions and imports--Continued

Source: Compiled from Basic Documentation for the Tariff Study, GATT.

Chart 4-I.--Finished industrial products: Distribution, by duty level, of MFN tariff provisions and imports

<sup>1/</sup> "World" data represent the average of data for 12 developed countries plus the European Community. It is calculated on the basis of the individual country averages using as a weight the corresponding value of national MFN imports.

Source: Compiled from Basic Documentation for the Tariff Study, GATT.

Chart 4-1. --Finished industrial products: Distribution, by duty level, of MFN tariff provisions and imports--Continued

Source: Compiled from Basic Documentation for the Tariff Study, GATT.

The profiles on semimanufactures indicate the largest concentration of U.S. dutiable MFN imports to be at rates of 5 percent ad valorem or less; the largest concentration of dutiable MFN imports for Japan, the European Community and the United Kingdom falls in the 5.1-10 percent bracket; and for Canada in the 10.1-15 percent bracket.

The profiles for finished manufactures show the largest concentration of U.S. dutiable MFN imports again in the 0.1-5 percent ad valorem bracket, and the largest concentration of the other countries in the 5.1-10 percent range.

#### Average MFN tariff levels for industrial product sectors

A lower level of aggregation at which average duty levels can be examined is that of the product sector. At this level, the diversity of rate treatment given to the various products emerges, and the averages, by virtue of the disaggregation, become considerably more meaningful indicators.

To develop average tariff data in terms of product sectors, the GATT contracting parties classified all industrial products into 23 sectors. In table 4-F, for each of the five countries, arithmetic and own-trade-weighted average MFN tariff levels are given for all products and for dutiable products in each of the 23 sectors, together with each country's imports in the sector.

Table 4-F. --Industrial sectors: Average MFN rates of duty and 1970 imports of Canada, the United States, Japan, the European Community and the United Kingdom

1/ A = Simple arithmetic average; W = weighted average (weights are country's own MFN imports).

2/ Less than 0.05 percent

Source: Compiled from Basic Documentation for the Tariff Study, GATT.

Note.--Because of rounding, figures may not add to the totals shown.

For an easier intercountry visual comparison of the average tariff levels by product sector, profiles of each country's tariff in terms of sectors are presented graphically in the charts on the following pages, the coverage of which is listed below:

Arithmetic averages:

- Chart 4-J -- Tariff profiles for all industrial products
- Chart 4-K -- Tariff profiles for dutiable industrial products

Weighted averages:

- Chart 4-L -- Tariff profiles for all industrial products
- Chart 4-M -- Tariff profiles for dutiable industrial products

Because the volume of trade is so very different between the first 12 sectors and the remaining 11, each of the profiles is shown in 2 parts: Part A gives the profiles for the major sectors, 1 through 12; part B gives the minor sectors, 13 through 23 (blown up on a much larger scale than the profiles of part A). The tariff profiles are drawn so that the height of the bar represents the duty average; the width of the bar, the scale of trading occurring under it. The various designs of patterns used within the bars are simply visual aids and have no significance of themselves.

It will be seen for all five countries that there is considerable concentration within the major sectors of trade (shown in part A of the profiles). For all five countries, four sectors (I-1, nonelectrical machinery; I-2, transport equipment; I-3, ores, metals and manufactures; and I-8, coal, petroleum and natural gas)

constitute half or more of their industrial imports. In comparing charts 4-J and 4-K with charts 4-L and 4-M it will be seen, that, typically, while arithmetic averaging produces a higher figure than own-trade-weighted averages, this is not consistently so. A further insight into the averages of each sector can be obtained by consulting the sector tariff and trade profile found in appendix chart 4-A.

## CHART 4-J.--TARIFF PROFILES FOR ALL INDUSTRIAL PRODUCTS

(Part A - Major Sectors (I-1 thru I-12))

Arithmetic average tariffs and tariff distribution of imports, by product sector, for Canada, United States, Japan, the European Community and the United Kingdom

## Industrial Sectors

I-1 Nonelectrical machinery	I-13 Rubber and rubber manufactures
I-2 Transport equipment	I-14 Raw hides and skins, leather and furskins and manufactures
I-3 Ores, metals and metal manufactures	I-15 Footwear and travel goods
I-4 Chemicals	I-16 Musical instruments, sound recording or reproduction apparatus

Inter-country rank correlations for industrial  
product sectors

The pattern of each country's rate levels among the 23 industrial product sectors and 119 subsectors was compared with the pattern of each of the other countries to measure the degree of similarity of their patterns of protection and to see if high or low rates are predominantly found in only certain sectors. Each of the four averages calculated both on "all products" and "dutiabale products only" in the GATT tariff study for the 23 sectors and 119 subsectors was arranged by height of duty for each country for comparison purposes and rank correlations then developed.

Rank correlation relates to ranking patterns only. Thus, it is a measure of the relationship of the consistency of the sectors carrying the highest duty rates, those carrying middle-level duty rates, and those carrying lowest rates in the different national schedules. The technique disregards the absolute level of duty rates and focuses only on the sequence or ranking of duty rates. Thus it would be possible for two countries with quite different rate levels to show perfect rank correlations so long as the sequence from highest to lowest was the same.

Table 4-G contains the Spearman rank correlation coefficients resulting from comparing the ranking patterns of each country's average tariffs for the 23 industrial sectors with the pattern of each of the four other countries; table 4-H gives the rank correlation coefficients for the 119 industrial subsectors. The tables are in

matrix format with the particular rank correlation coefficient for any pair of countries being read by combining a row with an adjoining column.

The coefficient of any rank correlation will be affected by any elements common to the data being ranked. Thus, common weights (even the number of BTN headings in a sector in the case of a simple mean) may increase the rank correlation coefficient of a set of numbers. It is therefore difficult to ascribe a definitive meaning to any given rank correlation, for example, 0.7, since part of the rank association may be due to common weighting elements. A coefficient of 0.7, however, does mean that if the ranks of one set of numbers are known, then about 70 percent of the ranks of the other set will be similar. But this knowledge does not include the information on how much of the 70 percent is due to actual tariff similarities and how much is due to common weights of one sort or another.

Table 4-G.--Spearman rank correlation coefficients for four types of average duties on 23 industrial sectors of United States, Canada, European Community, Japan, and United Kingdom

Source: Computed from average rates in Basic Documentation for the Tariff Study, GATT.

Nevertheless, in spite of the problem of interpreting the absolute magnitudes of the rank correlation coefficients and in spite of the problem of comparing coefficients using different averaging schemes, a fairly clear pairwise picture of relative tariff structures of countries can be obtained. That is, pairs of countries can be roughly ordered as to the similarity of their tariff structures on a rank basis. There is some ambiguity for certain pairs of countries that arises because of the averaging problem, but this can be put in perspective.

Certain statistical tests can be applied to determine whether a set of coefficients in a matrix are either statistically significant or simply chance. For the matrices in table 4-G, coefficients above 0.413 are statistically significant with a 95 percent probability, and those above 0.526 for 99 percent probability.

When all products are being considered (table 4-G), virtually all coefficients are statistically significant (only 3 of the 40 are not) and most are well above the level of 95 percent probability. As would be expected, the world-trade-weighted averages have generally higher coefficients than the arithmetic and own-trade-weighted averages. It is also notable, however, that, when only dutiable products at the sector level are examined, most coefficients for the arithmetic and own-trade-weighted averages are not statistically significant, whereas almost all coefficients for the world-trade-weighted averages are. The coefficients, however, tend to be generally lower than for all products.

Tariff averages for the 119 subsectors would seem to be the most desirable for comparing tariff structures between countries because the increased number of observations involved allows for a greater significance level at a given absolute value of correlation. Consequently, for table 4-H the correlation coefficients are significant at the 1 percent level.

Table 4-I ranks the rank correlation coefficients of table 4-H on the basis of one country paired with another. The means and

Table 4-I.--Ranks of country pairs of rank correlation coefficients for 10 calculations of average tariffs on industrial products <sup>1/</sup>

							*	9

Source: Computed from average rates in Basic Documentation for the Tariff Study, GATT

standard deviations of the rankings are given in the right-hand columns of the table. The matrix below the table shows the rank correlation coefficients between all of these pairwise rankings. These coefficients are all significant, indicating that the relative size of the rank correlation coefficients relate to each other in the different averages in a statistically significant manner. That is, while the relative ranking of these coefficients is not identical, the coefficients are statistically similar (on a rank basis).

A good visual representation from which relative quantitative conclusions can be drawn is given in chart 4-N. In the chart

Chart 4-N. -- Pairwise comparison of tariff structures for industrial products

Source: Table 4-I.

are plotted the means (and the standard deviation spread) of each of the country pairs' average range (i.e., the mean of ranks in each average in table 4-I). The stars locate the ranks of the rank correlation coefficients from table 4-I.

It is clear that the United States and the United Kingdom have the most similar tariff structures. It is also clear that Japan/United Kingdom, European Community/Japan, and Canada/Japan all have the least similar tariff structures and that the U.S. tariff structure is more similar to Japan than the EC structure is to Japan under any kind of a tariff weighting system.

Although the rank correlation coefficients show a fairly high degree of similarity in protection patterns of the five major tariffs, in the rankings it was found that "highest" rates and "lowest" rates were widely scattered among the sectors, and that there was an overlapping, as some sectors were revealed to include rates from both extremes. Examining only the arithmetic and own-trade-weighted averages, it is found that the three highest rates in each of the four averages <sup>1/</sup> of the five countries are scattered among 13 of the sectors. For example, sector I-5, textiles, held one of the three highest rates in the all product arithmetic average for the United States, the European Community, and the United Kingdom. There are only four sectors in which at least two countries had one of their three highest rates for any of the averages considered. These sectors and the countries involved are:

Sectors		Canada	United States	Japan	European Community	United Kingdom
No.	Product					
1-5	Textiles -----	X	X		X	X
1-10	Professional, scientific and controlling instruments, photographic apparatus, clocks and watches --		X		X	X
1-15	Footwear and travel goods -----	X		X	X	
1-19	Toys and sporting goods -----	X	X		X	X

<sup>1/</sup> Two arithmetic averages (all products, dutiable products) and two weighted averages (all products, dutiable products).

On the other end of the scale, the three lowest rates also were scattered among 13 sectors. However, eight sectors had two or more countries with one of their three lowest rates for any of the averages considered in the sector. These sectors and the countries involved are:

<u>Sectors</u>		<u>Canada</u>	<u>United States</u>	<u>Japan</u>	<u>European Community</u>	<u>United Kingdom</u>
<u>No.</u>	<u>Product</u>					
I-1	Nonelectrical machinery -----	X			X	
I-4	Chemicals -----	X				X
I-7	Pulp, paper and paper-board and manufactures -----		X	X		
I-8	Coal, petroleum, natural gas -----	X	X		X	X
I-12	Precious stones, precious metals and manufactures -----				X	X
I-13	Rubber and rubber manufactures -----	X	X	X		
I-20	Photographic and cinematographic supplies -----		X			X
I-21	Works of art -----	X	X	X	X	X

When duty ranks of the arithmetic and own-trade-weighted averages for 119 subsectors are examined, a different pattern is revealed. It is found that the five highest rates of each average in the five tariffs are accounted for in 22 of the subsectors, and that 10 of these are textiles. The industrial subsectors in which the countries have one of their five highest rates in each average is identified in table 4-J.

On the other end of the scale, the subsector identification of the five lowest average rates of each country is given in table 4-K. Here, also, 22 subsectors are required to account for each country's

five lowest averages. As would be expected, all but a few of the subsectors are raw materials or semimanufactures. It is perhaps noteworthy also that three of the subsectors also are listed in table 4-J where the five highest averages are listed.

#### Variable levies on agricultural products

Any examination of tariffs on agricultural products is more difficult and the results considerably less satisfactory than in the industrial area because of the widespread use of numerous other highly protective devices. The most significant of these are various forms of quantitative restrictions and the special type of tariff device known as the "variable levy." <sup>1/</sup> The heavy use of these mechanisms in several important agricultural product sectors significantly distorts trade and, consequently, affects the calculation of tariff averages which are weighted by trade. In dairy products, for example, the European Community carefully controls and restricts imports through the variable levy, the United States through quotas.

The use of the variable levy by the European Community (and to a far lesser extent by the United Kingdom prior to entry into the Community) causes one of the principal problems in developing representative tariff averages for agricultural products. As

---

<sup>1/</sup> Variable levies are, in effect, variable tariffs, which fluctuate in accordance with the disparity between a country's domestic support level of agricultural prices and world market prices. When the difference between support prices and world market prices increases, the variable levies increase; when it decreases, the variable levies decrease. Variable levies are discussed in Chapter VII of this report; quantitative restrictions in Chapter VIII.

the name indicates, the variable tariff changes, and for some products it changes frequently. For the present study, a representative figure, (for example, an average charge over a period of a year) has not been available for the numerous tariff line provisions in the European Community's Common External Tariff which are subject to variable levies or other changeable import fees, and consequently, these significant import charges (and in some cases the item itself) have had to be omitted in calculating the averages presented in this report. Except for tobacco, variable levies or other variable import fees are encountered to some extent in all sectors of the EC's agricultural tariff provisions.

It is highly important, therefore, for the reader to bear in mind that tariff averages presented in the following pages for the European Community reflect fixed duties only, and do not include variable levies and similar import charges. The same caveat holds for the averages of the United Kingdom, but such fees were far less significant in that country's tariff when the data for this report were collected.

In the Community's agricultural tariff, there are 1,122 line provisions. Eighteen percent of these have variable levy charges only and have had to be omitted entirely from the present calculation; an additional 25 percent are subject to both a fixed tariff and variable fee, and for these only the fixed tariff could be taken into consideration. Out of total Community imports in the agricultural area, 27 percent were subject to variable charges. Prior to preparations

for joining the European Community, the United Kingdom employed variable levies as part of its minimum price support system for cereals, cereal products and by-products. Variable levies applied to only 14 of the United Kingdom agricultural lines, but United Kingdom imports under the 14 provisions accounted for almost 7 percent of that country's agricultural imports in 1970.

Agricultural products: Overall average MFN tariff levels

With these stated limitations, average MFN tariffs on agricultural products are presented in chart 4-0. Japan is seen to have the highest rates on agricultural products. If data on variable levy charges were included, the averages shown for the Community would be substantially higher than those indicated, and the averages for the United Kingdom slightly higher. For all countries except the United States, "commitments" under the GATT not to exceed given levels of duty for specified products cover a substantially smaller portion of tariff provisions in the agricultural sector than is the case for industrial products. Therefore, when compared with the corresponding average tariffs for industrial products (chart 4-A), the agricultural tariff averages shown in chart 4-0 for countries other than the United States are much less indicative of their average level of GATT concessions. Canada has only about 23 percent of its agricultural tariff provisions covered by GATT concessions, the United Kingdom about 50 percent, the European Community 55 percent, and Japan 68 percent. About 92 percent of United States agricultural provisions reflect GATT concessions.

Chart 4-O. --Average MFN rates on agricultural products  
(Percent ad valorem)

\* Figures for Japan do not reflect unilateral reductions made in 1972 on about one-fourth of the Japanese rates in the agricultural sectors; more than half of the reductions were by 20 percent and most of the remainder were by amounts ranging between 33 percent and 100 percent.

Source: Compiled from national tariffs and trade statistics.

The profiles of the country averages are shown in chart 4-P, though again the conclusions to be drawn are limited given the pervasiveness of variable levies and quotas. From these profiles, 1/ however, it is seen that all five countries enter a significant portion of their agricultural imports duty free. In all cases such imports consist largely of tropical products such as coffee, bananas and cocoa not produced in temperate zone countries. The United States, Japan and the European Community have their largest concentration of dutiable imports in the 5.1-10 percent ad valorem bracket; Canada and the United Kingdom have approximately equal concentration in two brackets covering duties ranging from 0.1 to 10 percent ad valorem. All countries are seen to have rate provisions over 50 percent ad valorem, and 12.5 percent of Japan's imports entered at such rates.

One of the more interesting aspects of the graphic representation of the cumulative distribution of agricultural imports by duty level (chart 4-Q) 1/ is the contrast in each country's tariff/trade pattern with the comparable chart for industrial products (chart 4-C). The U.S. agricultural products curve starts at a much higher level than for industry (45 percent of agricultural products enter at a duty of 1 percent or less, compared with only 24 percent in industry) and continues more or less steadily upward

---

1/ The data from which charts 4-P and 4-Q are constructed are found in appendix table 4-E.

Chart 4-P.--Agriculture products: Distribution, by duty level, of MFN tariff provisions and imports

1 "World" data represent a cumulative distribution by duty level of imports by 12 developed countries plus the European Community.

Source: Compiled from national tariffs and trade statistics.

along a 45 degree line. The European Community's curve, even without inclusion of variable levies, starts at a lower level than for industry and is constantly below the 45 degree line. Canada, in strong contrast with its industry curve, shows a sharply rising curve in agriculture. The actual cumulative percentages of imports by duty levels are as follows:

Duty rate	"World"	Canada	United States	Japan	European Community <sup>1/</sup>	United Kingdom <sup>1/</sup>
Free	37.5	42.6	42.9	30.5	35.6	21.1
Under 5%	50.6	62.9	54.0	39.3	43.5	50.1
Under 10%	76.7	82.5	88.9	62.1	68.3	77.0
Under 15%	84.8	88.5	96.2	65.5	79.6	87.3
Under 20%	91.7	95.4	98.9	76.5	89.0	96.9
Under 50%	98.2	100.0	100.0	87.5	98.7	99.9

#### Agricultural product sectors

For calculating sector averages in agricultural products, the Tariff Commission has classified all agricultural and fishery products into nine sectors:

- A-1 Foodstuffs
- A-2 Grains
- A-3 Animals and products thereof
- A-4 Oil seeds, fats and oils, and their products
- A-5 Beverages and spirits
- A-6 Dairy products
- A-7 Fish, shellfish and products
- A-8 Tobacco
- A-9 Miscellaneous agricultural and forestry products

As already noted in Chapter III, some aspects of the sector definitions require further comment. First, the definition of

agricultural products for this report is that commonly used for the past several years in international tariff discussions, namely, products in Chapters 1-24 of the Brussels Tariff Nomenclature. In contrast to some classification systems, use of this definition places raw natural fibers--cotton, wool, hemp, etc.--in the industrial sector as raw materials, rather than in the agricultural area.

In addition, some of the nine sector headings are not entirely self-explanatory, such as "foodstuffs," where it is readily noted that other headings also contain edible items. "Foodstuffs" in this instance refers primarily to fruits and vegetables, spices, sugar, breads and related items and cereal preparations, and coffee, tea and cocoa (except when imported as a liquid beverage). "Beverages" covers fruit and vegetable juices, waters, lemonades and nonalcoholic drinks, wine, whiskey and "other beverages and spirits". "Miscellaneous agricultural and forestry products" refers to live trees, plants and seeds for sowing, raw vegetable materials suitable for use in dyeing and tanning, lacs, gums, resins, and "other" agricultural and forestry products, not elsewhere specified (n.e.s.).

#### Average MFN tariff levels for agricultural product sectors

Average MFN rates of duty on agricultural products for each of the nine sectors are listed in table 4-L. The data in the table are also presented graphically in profiles of agricultural provisions,

Table 4-L. --Agricultural sectors: Average MFN rates of duty and 1970 imports of Canada, the United States, Japan, the European Community and the United Kingdom

by product sector, in tariffs of the five countries in the charts on the following pages, the coverage of which is listed below:

Arithmetic averages:

Chart 4-R -- Tariff profiles for all agricultural products  
 Chart 4-S -- Tariff profiles for dutiable agricultural products

Weighted averages:

Chart 4-T -- Tariff profiles for all agricultural products  
 Chart 4-U -- Tariff profiles for dutiable agricultural products

From the profiles several things are immediately evident. The range of rates among the sectors is much greater than in the industrial area; also there is a considerably greater contrast between the "all products" and "dutiable products" profiles than in the industrial area. With the exception of Japan, the largest category of trade is sector A-1, foodstuffs (i.e. chiefly fruits, vegetables and cereal preparations), which range from 32.9 percent of total MFN agricultural imports for the European Community to 53.6 percent in the case of Canada. For Japan, grains is the largest category, constituting 30.9 percent of its total agricultural imports. In fact, the first four sectors -- A-1, foodstuffs; A-2, grains; A-3, animals and products thereof; and A-4, oil seed, fats and oils, and their products -- account for some three-quarters of agricultural trade for the five countries shown. The importance of these four categories as a proportion of total agricultural imports of each country in 1970 was as follows:

	<u>Percent</u>
Canada	80.7
United States	69.3
Japan	81.7
European Community	79.2
United Kingdom	75.6

Source: Compiled from national tariffs and trade statistics.

A further insight into the averages of each sector can be had by consulting the sector tariff and trade profiles found in appendix chart 4-B.

If, for each set of average tariff levels shown in table 4-L for the agricultural sectors of Canada, United States, Japan and the United Kingdom, country ranks of 1 through 4 are assigned, 1/ Japan is seen to have the highest ranking average in 26 of the 36 sets. Canada has the largest number of lowest ranking averages (13 sets). The number of times each country received each of the ranks is as follows:

<u>Rank</u>	<u>Canada</u>	<u>United States</u>	<u>Japan</u>	<u>United Kingdom</u>
1 (Lowest average)-----	13	8	3	12
2 -----	12	12	2	12
3 -----	8	14	5	7
4 (Highest average)-----	3	2	26	5

When duty ranks of the arithmetic and own-trade-weighted averages for the 36 agricultural subsectors are examined, it is found that the three highest rates of each of the tariffs are scattered among one-fourth of the subsectors, but over half of the 60 "highest" rates are in the two subsectors for tobacco, and almost one quarter are in the two beverage subsectors (wine and "other beverages and spirits"). The agricultural subsectors in which each country has one of the three highest rates in each average are identified in table 4-M.

---

1/ The European Community is omitted from this comparison because of the incompleteness of the EC data, which do not reflect variable levy charges.

Table 4-M.--Agricultural product subsectors with the three highest arithmetic and own-trade-weighted average duties for Canada, United States, Japan, the European Community, and the United Kingdom

Agricultural subsectors	Canada				United States				Japan				European Community 1/				United Kingdom

\*A-3 = Weighted averaged, all products.

\*D-1 = Arithmetic average, dutiable products.

\*D-3 = Weighted average, dutiable products.

Source: Compiled from national tariffs.

It should be noted that data for the European Community could not take into account the EC's variable levies, but reflect only fixed tariffs.

The agricultural subsectors where the three lowest rates of each average for each country are found are listed in table 4-N. There it is seen that the low rates are considerably more dispersed than the high rates, as 12 of the 36 subsectors are required to account for them, and there is not the degree of concentration found in the higher rates. The largest number of low rates (11 of the 60) are found in the subsectors for coffee, tea and maté.

The effect of differences in customs valuation  
on average duty levels

In an earlier section of this chapter it is pointed out that the system of valuing imported articles for assessing ad valorem tariff rates must be considered when comparing duties on individual products. Of the five major tariffs for which average duty levels have been compared, the European Community, Japan and the United Kingdom assess ad valorem rates on a "c.i.f. basis," whereas the United States and Canada use an "f.o.b. type" value. The significance of the difference in valuation systems for the average tariff levels is examined in the following paragraphs.

The actual amount of duty collected from an ad valorem rate applied to an f.o.b. value is less than that collected by the same nominal rate applied to a c.i.f. value, and consequently the

Table B-N.--Agricultural product subsector: with the three lowest arithmetic and own-trade-weighted average duties for Canada, United States, Japan, the European Community, and the United Kingdom

<sup>1/</sup> Data for the European Community does not take into consideration variable levies.

\*A-1 = Arithmetic average, all products.

\*A-3 = Weighted average, all products.

\*D-1 = Arithmetic average, dutiable products.

\*D-3 = Weighted average, dutiable products.

Source: Compiled from national tariffs.

collected f.o.b. duty should be expressed as a lower "rate" when comparison is made with the duty collected on a c.i.f. basis.

Using factors published by the U.S. Bureau of the Census to convert values reported in U.S. import statistics to a c.i.f. basis, 1/ the ratio of U.S. duties collected in each of the 23 industrial sectors to the estimated c.i.f. value of imports in each sector was calculated for comparison with the "f.o.b." duty averages for the 23 sectors set forth for the United States in the preceding pages. This recalculation of the arithmetic and own-trade-weighted averages at the "all products" (dutiable and free) level of each sector, produced lower average duties for the sectors by the following amounts:

Duty Reduction (percentage points)	Number of sectors	
	Arithmetic Average	Own-trade- weighted
0.0 -----	1	3
0.1 -----	1	1
0.2 -----	4	4
0.3 -----	3	5
0.4 -----	1	-
0.5 -----	1	-
0.6 -----	2	3
0.7 -----	-	1
0.8 -----	6	2
0.9 -----	1	1
1.0 -----	1	1
1.1 -----	1	1
1.2 -----	-	-
1.3 -----	1	-
1.4 -----	-	1

Thus, it is seen that although the valuation base for assessing ad valorem rates is of substantial importance at the individual

---

1/ Highlights of U.S. Export and Import Trade, FT 990, U.S. Department of Commerce, March 1969, pp. III-VI.

product level, when large aggregates of products are considered it becomes of relatively minor significance so far as the average level of duty is concerned. The difference in the average rate for a sector resulting from using a c.i.f. rather than an f.o.b. valuation base for U.S. imports did not exceed one-half percentage point in the arithmetic average for 11 of the 23 industrial sectors, and in the own-trade-weighted averages for 13 of the sectors. Moreover, none of the differences exceeded 1.5 percentage points.

## Average Tariff Level of Other Developed Countries

Average tariffs of eight market economy countries

For comparison with the five major tariffs which have been examined in the foregoing pages, selected averages for industrial tariffs of eight other developed countries are presented in table 4-0 at the all products level and for the three stages of manufacture. The

Table 4-0.--Average rates of duty on industrial products for selected developed countries 1/

1/ The averages shown are the simple arithmetic average and the own-trade-weight average.

Source: Basic Documentation for the Tariff Study, GATT.

averages shown in table 4-0 correspond to those given for the five major tariffs in charts 4-A, 4-D, 4-E and 4-F. It is seen from table 4-0 that virtually all averages of Australia and most for New Zealand are above (and frequently substantially above) the highest corresponding average of the major countries. Almost all averages for Switzerland are below the lowest corresponding average in the

five major tariffs, as are most of the averages of Denmark and Sweden. For Austria, Finland and Norway, the majority of averages fall within the range of the five major tariffs.

Agricultural product sector averages for the eight countries are given in table 4-P.

About 70 percent of the averages shown in the table are within the range of the corresponding averages for the five major countries, 17 percent are higher than the highest corresponding average among the five countries, and 12 percent are lower than the lowest corresponding average. Unlike the averages for industrial products, the majority of averages of each of the eight countries shown in the table fall in the same range as the major tariffs.

#### Average tariffs of the Soviet Union

The Soviet Union maintains a "two-column" tariff, and in addition, gives preferential treatment for products of developing countries. Rates listed in the "minimum" rate column are applicable to goods originating in or imported from developed countries which grant MFN treatment to Soviet products; the "maximum" rate column applies to goods from developed countries which apply discriminatory rates against Soviet products. All goods imported from less developed countries are admitted duty free. The Soviet tariff law states: "Where goods are dutiable at the maximum customs tariff rates, the additional duties (represented by the difference between the rates for such goods and the minimum rates) shall not be borne by the Soviet customers (actual purchasers), nor shall they be paid

by a reduction of any amount to be paid by the above-mentioned Soviet organizations [responsible for importing goods] in favor of the budget of the Union."

The simplicity of the Soviet nomenclature presents an extreme contrast with the detailed and complex nomenclature of the market economy industrialized countries. The Soviet tariff contains 271 rate provisions distributed among nine schedules. The schedules are listed in table 4-Q, together with the arithmetic average rate for each schedule, the range of rates and the number of tariff lines.

Table 4-Q —U.S.S.R. tariff schedules: Arithmetic average rates, range of rates and number of rate lines

## Discriminatory Tariff Treatment

Preferential tariff agreements

The preceding discussion of tariffs has been almost entirely in terms of so-called "most-favored-nation" rates of duty. Any tariff rate establishes a discrimination against the imported product in favor of the domestic one, and the tariff's effect on the volume of imports depends largely upon the measure of discrimination. A significant additional consideration in its effect for individual supplying countries, however, is whether the tariff is uniformly applied to all foreign suppliers. Even a modest duty may foreclose participation in a market if other competing foreign suppliers are permitted free entry.

During the past 15 years there has been a proliferation of preferential trade arrangements throughout the world. Numerous customs unions and free trade areas have been formed in which tariffs are removed or reduced on products of members but remain unchanged on imports from nonmembers. The European Community and the European Free Trade Association are by far the most important of these. <sup>1/</sup> The United Kingdom, Denmark and Ireland have recently joined the European Community, and the remaining EFTA countries have negotiated

---

<sup>1/</sup> Others include the Latin American Free Trade Association, the Caribbean Free Trade Association, the Central American Common Market, the Central African Customs-Economic Union, the Customs Union of West African States, the East African Common Market, the Arab Common Market, the Tripartite Accord (India, Yugoslavia, Arab Republic of Egypt), and a recently negotiated agreement which became effective on February 11, 1973, and established tariff preferences among eight developing countries located throughout the world. An additional eight countries which participated in the negotiations are to be included but have not yet ratified the protocol.

significant preferential trading arrangements with the Community. During the past few years, the Community has established preferential trading arrangements with most of the important Mediterranean countries and several African countries (most of which are former colonies of EC members). Under an agreement with Canada in 1965, the United States accorded Canadian automotive products preferential duty-free treatment. Many developed countries have instituted a generalized preference system for products of developing nations in the past few years.

#### The GATT statistical study of preferential trade

Concerned with the discrimination which these arrangements involve, the United States in 1971 proposed that the GATT contracting parties make a statistical study of the changes in the proportions of goods imported at most-favored-nation (MFN) rates and at other rates. The study revealed that although the value of goods imported annually by nations of the world has more than tripled since 1955, (a significant growth in spite of the effect of inflation) the percentage of goods imported at most-favored nation rates has declined steadily. It also showed that the increase in trade under preferential tariff arrangements was on the whole faster than that of total world trade. The study covered imports of 33 contracting parties to the General Agreement and of Hong Kong for 4 selected years in a 15-year period and accounted for about 85 percent of the total imports of the contracting parties in 1970.

Preferential imports, for the purposes of the study, were defined as all imports entering at duty rates lower than MFN rates

and included intra-regional trade of the European Community and the European Free Trade Association, imports under the Commonwealth preference scheme, U.S. imports from Canada under the U.S.-Canadian Automotive Products Agreement, and imports under all other preferential agreements in existence during the years examined. The following tables show the distribution of most-favored-nation and preferential imports, both in percent of imports (table 4-R) and value of imports (table 4-S), as reported in the survey.

Table 4-R.--Percent of imports of GATT contracting parties entered at most-favored-nation and at other rates of duty, selected years 1955-70

Year	Total imports 1/	Percent of contracting parties total imports (column 1) at				Percent of contracting parties total imports (column 1) represented by preferential imports of:				Percent of total preferential imports (column 3) represented by imports of

As shown in table 4-R, the portion of imports of the contracting parties dutiable at preferential rates increased about 140 percent during the 15 year period covered by the survey. Most of the increase was attributable to the growth in preferential imports of the European Community, which comprised 15.9 percent of the contracting parties' total imports in 1970 and whose share of preferential imports rose from 16.8 percent of the total of such imports in 1955 to 65.4 percent in 1970. Although preferential imports by EFTA countries showed an absolute increase, their share of total preferential imports declined from 15.7 percent in 1961 to 14.4 percent in 1970. U.S. imports under the U.S.-Canadian Automotive Products Agreement constituted 6.2 percent of the total in 1970, the only year included in the survey in which this agreement was in effect. The percentage of imports under other preferential arrangements declined in relation to both total imports of the contracting parties (from 8.4 to 3.4 percent) and total preferential imports (from 83.2 to 14.0 percent) during the period surveyed.

#### Influence on trade of preferential arrangements

The GATT study provides some insight into the effect of preferential arrangements on trade. As intra-EC imports grew rapidly, the portion of EC imports supplied by the United States in the years surveyed declined from approximately 11.1 percent in 1955 to about 9.5 percent in 1970. In the same period, however, the share of total U.S. exports going to the Community increased from 16.8 to 19.5 percent, an increase that was made possible by the substantial growth of Community imports in the 15 years covered.

In contrast, the U.S. share of total world exports declined from 16.6 to 15.5 percent. The average annual rate of growth of U.S. exports to the European Community exceeded the average rate of growth of total U.S. exports. Exports to the Community grew at 8.1 percent per annum; exports to the world at 7.1 percent per annum. World exports (computed from U.N. commodity trade statistics) grew at an average rate of 8.2 percent a year in the same period. U.S. imports from the EC during the period also rose sharply from \$1.1 billion in 1955 to \$6.6 billion in 1970, but in absolute terms were consistently below U.S. exports.

Between 1955 and 1970 the share of European Free Trade Association imports (excluding Iceland and Portugal) supplied by the United States rose from 8.5 to 9.3 percent. However, the ratio of U.S. exports to the EFTA in relation to U.S. world exports declined from 11.2 to 10.4 percent. During these years the United Kingdom accounted for more than half of EFTA imports from the United States. In 1970 the value of EFTA imports from the United States amounted to 53 percent of the value of EC imports from this country.

As a result of the admission of the United Kingdom into the European Community, the Commonwealth Preference System, which includes 32 countries, is changing. Australia, Canada, New Zealand, South Africa and seven developing nations in the Commonwealth will lose their tariff preferences in the United Kingdom; twenty developing nations will retain their preferences until 1975. Additional changes and adjustments in the preferential arrangements which existed under the Commonwealth system can be expected.

The proliferation of preferential trading blocs

The widespread development of preferential trading blocs raises the question of whether the nations not affiliated with these groups are serving their national interests by maintaining a most-favored-nation policy. The activation in 1970 of associate agreements between the EC and Israel, Spain and Turkey; the admission of Ireland, Denmark and the United Kingdom to the European Community; the entrance into force on January 1, 1973, of agreements between the European Community and Austria, Portugal, Sweden and Switzerland; and the previously mentioned activation of the agreement between developing countries will reduce MFN trade significantly below its 1970 level. Preferential arrangements between the European Community and the remaining countries of the EFTA (Iceland, Finland and Norway) are now being negotiated or contemplated. If these agreements are completed, a trading bloc encompassing most of Western Europe, the Mediterranean area, and a large part of Africa will be created. It must be anticipated that the formation of such a bloc will have a significant effect on the trade of outside nations.

The agreements between the Community and EFTA countries call for the eventual elimination of tariffs on many commodities, principally industrial products. They also establish complicated "rules of origin" which specify the criteria products must meet to qualify for preferential tariff treatment when traded between parties to the agreement. These rules of origin can be particularly damaging to countries outside the trading bloc that generally supply components for industrial products to the participating nations. For

example, European subsidiaries of U.S. companies (or any other purchaser of U.S. components) will often have to obtain their components from local sources instead of using components produced by the parent company in the United States if their product is to receive preferential treatment.

#### Historical background of preferential agreements

The existence of preferential trading arrangements, of course, is not new. From the beginning of international commerce the economic needs of trading nations have fostered policies that favored one nation over another. Preferential tariff treatment of imports from favored sources has probably existed since customs duties were first established in international trade. Preferences have often been stipulated in treaties of friendship, commerce, and navigation. Historically, trade preferences have generally been limited to contiguous countries, countries under a common sovereignty, or formerly under a common sovereignty, and countries that are jointly members of a customs union or free trade area. The development of tariff preferences was given impetus by European colonial expansion and many of the systems in existence today stem from the laws and practices developed during this period.

The desire of any nation to avoid discriminatory treatment of its products in trade with other countries led to the development in commercial treaties of the most-favored-nation concept under which any advantage, favor, privilege or immunity granted by one party to the treaty to any product originating in or destined

for any other country shall be accorded to the other party or parties to the treaty. Most-favored-nation clauses in commercial treaties have two forms: conditional and unconditional. In the conditional form, MFN treatment is accorded only with reciprocal compensation; in the unconditional form, MFN treatment is extended automatically.

In treaties among European nations, the unconditional clause has been used throughout most of the period since the term first appeared in commercial treaties at the end of the 17th century. The United States used the conditional form until 1923, when it reversed its policy and adopted the unconditional form. A mixed practice has been followed in the rest of the world.

#### United States MFN policy

For the past 50 years, unconditional MFN treatment has been one of the important principles in U.S. commercial policy. At the time the United States changed to the unconditional MFN standard, it had two preferential arrangements in effect which dated from the beginning of this century: free trade with the Philippines and reciprocal preferences with Cuba. For several years the preferential treatment of Philippine products has been phasing out and will terminate in 1974. The Cuban preferences are currently inoperative. With respect to tariff treatment, the United States has made only two significant digressions from the unconditional MFN standard, the application of discriminatory rates to the products of the Communist bloc countries, and the inauguration in 1965 of preferential duty-free treatment for Canadian automotive products.

The Reciprocal Trade Agreements Act of 1934 stipulated that tariff reductions negotiated under the authority of that act be applied unconditionally to imports from all sources. From the inception of the trade agreements program, the United States strove to eliminate discriminatory tariff treatment against U.S. exports by negotiating the reduction or elimination of tariff preferences for products of other nations. Until the late 1950's, there was some degree of success in achieving this goal.

When the General Agreement on Tariffs and Trade was formulated in 1947 under U.S. leadership, the most-favored-nation policy of nondiscrimination was made Article I of the agreement as a fundamental principle for achieving trade liberalization. Each contracting country agreed, insofar as customs duties and other trade barriers were concerned, to grant to the products of all contracting parties the same favorable treatment given to the products of a "most-favored-nation". Article I of the General Agreement is the direct descendant of unconditional MFN clauses incorporated in every bilateral trade agreement concluded by the United States after 1934. However, as in its predecessor MFN clauses, exceptions to Article I were included in the agreement which have created problems. The most significant and troublesome exception has proven to be the one dealing with the formation of customs unions and free trade areas.

## Tariff Rate Disparities Among Nations

### Reasons for rate differences among nations

From the foregoing data on average tariff levels, it is seen that among the tariffs of the five countries compared, only very seldom do two nations have the same average rate for a product sector. Furthermore, differences among the average levels of the five countries can be substantial. As one moves further down the scale of disaggregation to subsectors and eventually to single products, the frequency of identical rates seems to diminish and the differences among rates of the various countries becomes more pronounced.

A common complaint received by governments from domestic producers seeking to export their products is that the producer encounters higher tariff rates in foreign countries than are charged by his own government on imports into his own domestic market. Obviously, the producer considers this situation grossly unfair. Rates cited in such complaints usually (but not always) differ widely. The producer asks why such an "unfair" situation has arisen and why it is permitted to continue.

There are numerous valid reasons why tariffs levied on a product differ among nations. The basis for the differences is established by the very reasons for which tariffs are levied at all: to protect domestic industry and to collect revenue. To the degree that rational decision-making governs the setting of duty rates for protective purposes, there is a general tendency to have low duty rates on products on which the domestic industry enjoys

competitive strength and high duty rates on those products where the domestic industry is weak. In other words, in theory, the height of the duty is geared to the degree of need (or assumed need) for protection by the domestic industry, and national economies differ in their areas of strengths and weaknesses. If revenue is the purpose of the duty, then the height of the duty is conditional upon the amount of revenue to be produced, and this also varies among nations. In fact, the economic and other conditions underlying these two fundamental reasons for levying import tariffs differ so greatly among nations that it would seem almost accidental happenstance when any two nations decide to levy the same tariff on a product; and different, rather than identical, rates among nations should be the expected norm.

#### Historical evolution of tariff schedules

Aside from these theoretical justifications for rate differences, a further explanation is to be found in the historical development of the tariff schedules currently applied by the major nations. It may be said, in general, that the average height of a country's tariff reflects the conscious intent of the country's commercial policy. This might even hold for some product sectors within the schedule as a whole, but when it comes to the vast majority of rates applicable to individual products, the current level of the duty simply reflects the result of an historical evolutionary process made up of rate changes which bore little, if any, relationship

to the theoretical foundation on which tariff levels presumably should be established. The United States tariff schedule provides an example typical in many respects.

Forty-three years ago the Congress legislated a new tariff schedule for the United States in the Tariff Act of 1930. This act contained many provisions identical both in nomenclature and rates to provisions existing in the Tariff Act of 1922 (and some traceable even to prior tariff acts), but more frequently the rates of duty were increased substantially (see chart 3-H in Chapter III). In the best of light, it might be assumed for the present purposes that the rates then established reflected each industry's need for protection. 1/

In the Reciprocal Trade Agreements Act of 1934, Congress delegated to the President authority to negotiate reductions in the rates established in the Act of 1930 in return for reciprocal reductions in tariffs of foreign countries. A large number of bilateral agreements were subsequently concluded, each reducing selected individual rates throughout the tariff schedules. After World War II, multilateral negotiations under the General Agreement

---

1/ A number of Congressmen and Senators contended out of the experience of writing the Tariff Act of 1930 that it was impossible to continue enacting tariff legislation in such a manner, and Senator Capper, from his experience, observed in 1934:

"We do not write a national tariff law. We jam together, through various unholy alliances and combinations, a pot-pourri of hodge-podge, sectional and local tariff rates..." (Congressional Record, 73rd Cong. 2nd Sess., vol. 78, pt. 10, p. 10379.)

on Tariffs and Trade replaced the bilateral approach, but the technique was still selective reduction and the selection of the rates to be reduced depended chiefly upon which countries happened to be negotiating. However, in the most recent of these multilateral negotiations, across-the-board "linear" cuts was the declared standard for the negotiation.

In 1963, the United States modernized and substantially modified its tariff nomenclature. Although the legislative mandate under which this was carried out was to avoid any but "incidental" rate changes, they were numerous. Simultaneously, throughout the whole period from 1930 to the present, changes in prices wrought corresponding changes in the significance of the large number of specific rates contained in the U.S. tariff schedule. The overwhelming direction of change has been downward, and many specific rates which were high in terms of 1930 price levels have been reduced to insignificance simply by the rise in the general level of prices since then.

The United States duty rates today are largely the product of reductions from the legislated rates of the Tariff Act of 1930 carried out under the bilateral trade negotiations in the thirties and in consequence of six rounds of negotiations under the GATT. Under the circumstances, "historical accident" might well be the most appropriate explanation for the current actual level of most rates on individual products in the U.S. tariff schedule. The same can undoubtedly be said of the tariff schedules of most major nations.

Given this rather haphazard development of rate levels on individual products it is small wonder (aside from any possible theoretical justifications) that differences are found in rates applied by the various nations to any particular product.

The disparity question

Canada, at least until recently, has perhaps been the most commonly named country in U.S. producers' complaints of disproportionately high rate treatment encountered abroad. Consequently, over a long period of time, the removal or lessening of differences between U.S. and Canadian rates on particular products has been an important consideration in the several tariff negotiations held with Canada since the 1930's. However, such rate differences were never a consideration, at least of any significance, in other trade negotiations until quite recently.

At the Kennedy Round, one of the "issues" which drew much public attention and added to the difficulties of those negotiations concerned wide differences between national tariff rates for particular products. In the Kennedy Round such widely different rates came to be called "disparities". The issue arose in those negotiations out of the discussion of achieving reciprocity when "linear" tariff reductions are made. The European Community contended that the proposal for an across-the-board 50 percent tariff cut strongly sought by the United States would be unduly favorable to the United States and disadvantageous to other nations because the United States

tariff schedules contained many "high" rates on individual products, compared with the rates of other countries. These rates, they contended, were sufficiently high that, even after a linear 50 percent cut, they would still retain a large part of their "protective" factor, whereas the protective factor would be largely removed by a similar cut in the lower rates of other countries.

Under the working rule adopted specifically for the Kennedy Round after prolonged argument, a "disparity" was recognized to exist when the "high" rate was at least 100 percent greater than the "low" rate and there was at least 10 percentage points difference between the two rates. <sup>1/</sup> In GATT discussions today, the term "disparity" has the restricted meaning of the sense in which it was used in the Kennedy Round, i.e., to refer only to situations in which tariff rates differ widely, it is not used to characterize small rate differences.

#### Identifying disparities

As in virtually all complaints of international differences in rate treatment, the disparities argument in the Kennedy Round was concerned only with tariff rates on individual products, not average rates for groups or categories of products. To examine tariff

---

<sup>1/</sup> A further stipulation required that a disparity must have "trade significance" before it could be considered in the balance of the negotiations. It is not surprising that it was impossible to define trade significance in a manner satisfactory to all parties, and after four years of argument, the issue was largely detoured in the final stages of the Kennedy Round.

disparities in this context, a very detailed comparison of tariffs is required. In order to address the issue in the Kennedy Round, it was necessary to develop a complete, detailed concordance between the U.S. tariff schedules and the EC's Common External Tariff. Concordances do not exist for relating the detailed U.S. provisions to the tariff schedules of Japan, Canada, and the United Kingdom, and the EC/TSUS concordance prepared in 1966 for the Kennedy Round is out of date. It was therefore not possible to make a thorough detailed international comparison of tariff rate provisions in order to identify disparities. However, the range of rates in each 4-digit BTN heading of Canada, Japan, the European Community and the United Kingdom have been examined to identify where disparities may possibly be found to exist. In addition, similar comparisons of rate ranges, plus average duty levels, have been made for the leading subsectors in U.S. industrial and agricultural trade with the four other major countries.

As noted earlier, much of the complaint made to Congress and other branches of the U.S. government on the subject of tariff disparities has related to rate differences between the United States and Canada and, more recently, Japan. <sup>1/</sup> Canada and Japan are the two largest trading partners of the United States. As

---

<sup>1/</sup> It is noteworthy that the Kennedy Round disparities squabble did not involve Canada or Japan, but was virtually exclusively complaints by the European Community against disparate rates of the United States. The United Kingdom was a somewhat reluctant participant in the argument.

noted in the preceding tariff profiles drawn in terms of 23 sectors for industry and nine for agriculture, both Canada and Japan, like the United States, have a number of substantial rates. A casual glance at the sector tariff and trade profiles for the countries in appendix charts 4-A and 4-B will provide some understanding as to why complaints would be concentrated against these two countries.

The European Community established its Common External Tariff relatively recently by arithmetically averaging the rates of its original six members. The Benelux Countries had a tradition of low tariffs, Germany, of middle-level tariff protection and, France and Italy, of high tariff protection. Harmonizing the national tariffs of these six countries produced a tariff of moderate height rather consistently throughout most product sectors. <sup>1/</sup> It will be recalled from chart 4-A on industrial products that EC rates are the lowest, whether comparison is between all imports or only dutiable imports and by either average.

When comparison is made between the United States and Canada and the United States and Japan, it will be seen on all products that the United States turns out to have higher rates than either Canada or Japan by either average. However, when comparison is made on only dutiable products, Canadian rates are higher than the United States by either average, and U.S. rates are higher than the Japanese by the arithmetic average, but Japanese rates are higher by the own-trade-weighted average.

---

<sup>1/</sup> A notable exception is those agricultural products where a variable levy is utilized.

In order to be able to look more carefully at the often raised issue of disparities, eight charts (4-V through 4-CC) have been prepared to show the range of rates and the average duty for the 10 industrial subsectors representing the highest level of exports and imports with major trading partners of the United States--Canada, Japan, the European Community and the United Kingdom. The bars indicate the duty rate range of the tariff lines included within the subsector; the arrows locate within the range the own-trade-weighted average duty on the basis of MFN trade on all products, (dutiable and non-dutiable) in the subsector. It will be noted that high rates occur with greater frequency in the Tariff Schedules of the United States than in the schedules of the other countries being compared.

The charts are designed to illustrate the degree of possibility for the occurrence of disparate rate situations in major products; the charts do not identify actual disparities. To illustrate from chart 4-V, on U.S. exports to Canada, in the subsector on construction, mining and handling equipment, where the top U.S. rate is seen to be 5 percent ad valorem and Canadian rates extend to 20 percent, it is highly likely that disparate situations may be found on individual products in the subsector. Similarly, in metal manufactures, where the top Canadian rate is 30 percent ad valorem, U.S. rates extend to 50 percent. It is noteworthy that in all eight charts, the own-trade-weighted average of the countries being compared frequently are similar.

Chart 4-V. -- Comparison of duty rates on leading U.S. industrial exports to Canada, 1969

(Bar indicates range of duties; arrow indicates weighted average duty <sup>1/</sup>)

<sup>1/</sup> Weights used in calculating the average duty are the country's own NON imports. When the bar begins a distance out from the zero base line, the country has no duty-free provisions. Industrial tariff comparisons: United States and four  
major trading partners

In most comparisons of duty rates, it is readily apparent which partner has the higher range. In some situations, especially in the U.S./Japan and the U.S./United Kingdom charts, interpretive principles are necessary. In most comparisons, such as where the bottom of both country ranges is the same, the comparison of the high end of the range is the sole governing element. On the other hand, where the high ends are equal but one country's rates begin at a higher point than the other, the latter is considered to have the higher rates. Thus, 9-15 is taken as higher than 4-15.

In chart 4-V and 4-W presenting the information on U.S.-Canadian trade, it will be seen that on leading U.S. exports to Canada, the U.S. range of duty rates is in five instances greater than Canada's; Canada's is in four instances greater than that of the United States, and in one instance, the range is equal. On leading U.S. imports from Canada, the range of U.S. duty rates exceeds Canada's in five cases, Canada exceeds the United States in three, and in two sectors they are equal. When note is taken of the comparative own-trade-weighted averages, on exports the relationship is:

The United States is higher in 4 instances;  
Canada is higher in 6 instances.

On leading imports:

the United States is higher in 4 instances;  
Canada is higher in 5 instances;  
the two countries are equal in 1 instance.

Thus on leading items of trade, the number of "higher and lower" positions are not far apart.

In comparison of duty rate ranges on the 10 leading U.S. exports to Japan, it will be seen in chart 4-X that:

the U.S. range is higher in 4 instances;  
the Japanese range is higher in 4 instances;  
the two countries are equal in 2 instances.

On leading U.S. imports from Japan, (chart 4-Y), the comparison indicates that:

the U.S. range is higher in 6 instances;  
the Japanese range is higher in 4 instances.

On the other hand, when own-trade-weighted averages are compared on leading U.S. exports:

the U.S. average is higher in 3 instances;  
the Japanese average is higher in 7 instances.

With respect to leading U.S. imports from Japan, the comparison indicates that:

the U.S. average is higher in 5 instances;  
the Japanese average is higher in 5 instances.

When comparison is made with the European Community on duty rate ranges, the relationship on leading U.S. exports is as follows (chart 4-Z):

the U.S. range is higher in 6 instances;  
 the EC range is higher in 3 instances;  
 the two countries ranges are equal in 1 instance.

The relationship on ranges of leading U.S. imports from the EC  
 (chart 4-AA) is:

the U.S. range is higher in 8 instances;  
 the EC range is higher in 2 instances.

When, however, the comparison is made on the basis of own-trade-weighted averages, on leading U.S. exports to the EC the relationship is:

the U.S. average is higher in 2 instances;  
 the EC average is higher in 8 instances.

On imports, the relationship is:

the U.S. average is higher in 4 instances;  
 the EC average is higher in 6 instances.

Thus, although the European Community holds the lowest averages at the "all products" level, the Community frequently has the higher average for own-trade-weighted averages for the leading trade items.

For trade with the United Kingdom (charts 4-BB and 4-CC) the duty ranges on the leading trade subsectors compare as follows:

Leading U.S. exports:

the U.S. range is higher in 5 instances;  
 the U.K. range is higher in 3 instances;  
 the two countries ranges are equal in 2 instances.

Leading U.S. imports:

the U.S. range is higher in 6 instances;  
 the U.K. range is higher in 3 instances;  
 the two countries ranges are equal in 1 instance.

On comparative own-trade-weighted averages between the United States and the United Kingdom:

Leading U.S. exports:

the U.S. average is higher in 1 instance;  
the U.K. average is higher in 8 instances;  
the two countries averages are equal in 1 instance.

Leading U.S. imports:

the U.S. average is higher in 2 instances;  
the U.K. average is higher in 7 instances;  
the two countries averages are equal in 1 instance.

Thus, while there is no significant difference in the score when comparison is of range of duty rates, there is a notable difference on own-trade-weighted averages. United Kingdom rates produce higher averages than the U.S. rates.

Agricultural tariff comparisons: United States  
and four major trading partners

Four similar charts have been prepared for comparing duty rates on agricultural trade (charts 4-DD through 4-GG). Because value amounts in agricultural trade taper off quickly, only five subsectors have been used in the agricultural comparisons. When, in chart 4-DD comparing U.S.-Canadian rates, the duty rate range is examined for the top five leading exports, it will be observed that the U.S. tariff range is greater in all instances. When the top five leading imports from Canada are noted, it will be seen that again, the U.S. tariff range is greater in each instance. When own-trade-weighted averages are compared on exports, the U.S. average is higher than the Canadian in four subsectors; in one, Canada is higher than the United States. On imports, the U.S. average is higher than the Canadian in three subsectors; the Canadian average is higher in two.

Chart 4-DD. -- Comparison of duty rates on leading U.S. agricultural trade with Canada, 1969

(Bar indicates range of duties; arrow indicates weighted average duty <sup>1/</sup>)

<sup>1/</sup> Weights used in calculating the average duty are the country's own MGN imports. When the bar begins a distance out from the zero base line, the country has no duty-free provisions. For additional information on tariffs, trade and the specific coverage of the product groups, see part III of this report.

Source: Compiled from national tariffs and trade statistics.

Chart 4-EE. -- Comparison of duty rates on leading U.S. agricultural trade with Japan, 1969

(Bar indicates range of duties; arrow indicates weighted average duty <sup>1/</sup>)

<sup>1/</sup> Weights used in calculating the average duty are the country's own MFN imports. When the bar begins a distance out from the zero base line, the country has no duty-free provisions. For additional information on tariffs, trade and the specific coverage of the product groups, see part III of this report.

<sup>2/</sup> Single rate provision, hence no range.

Source: Compiled from national tariffs and trade statistics.

Chart 4-FF. -- Comparison of duty rates on leading U.S. agricultural trade with the European Community, 1969

(Bar indicates range of duties; arrow indicates weighted average duty <sup>1/</sup>)

<sup>1/</sup> Weights used in calculating the average duty are the country's own MFN imports. When the bar begins a distance out from the zero base line, the country has no duty-free provisions. For additional information on tariffs, trade and the specific coverage of the product groups, see part III of this report.

<sup>2/</sup> Data on variable levies are from the U.S. Department of Agriculture. The averages are calculated by using the EC's MFN imports. Data coverage for grains is 94 percent; for fresh, chilled or frozen meat, 87 percent; for butter and cheese, 32 percent (butter, 91 percent; cheese, 3.3 percent). Coverage for prepared or preserved meat and other meat products is so deficient that no average is provided.

Chart 4-GG. -- Comparison of duty rates on leading U.S. agricultural trade with the United Kingdom, 1969

(Bar indicates range of duties; arrow indicates weighted average duty <sup>1/</sup>)

(percent ad valorem)

<sup>1/</sup> Weights used in calculating the average duty are the country's own MFN imports. When the bar begins a distance out from the zero base line, the country has no duty-free provisions. For additional information on tariffs, trade and the specific coverage of the product groups, see part III of this report.

<sup>2/</sup> Single rate provision, hence no range.

Source: Compiled from national tariffs and trade statistics.

In chart 4-EE, where similar information is presented for Japan, it will be seen with respect to tariff ranges for exports that U.S. rates are higher for three of the subsectors, that Japan is higher in one subsector, and in one, the two countries are equal. On leading U.S. imports, the U.S. range is higher in two subsectors and the two nations are equal in three. On own-trade-weighted averages, on the other hand, Japan has higher averages on all five U.S. export subsectors and all five U.S. import subsectors.

Chart 4-FF presents comparisons with the European Community. On this chart variable levy data has been added to the extent possible. If note is taken of tariff and variable levies together, on the leading U.S. exports to the European Community, it will be seen that the U.S. range is higher for three subsectors; the EC range for two. On imports, the Community has the higher range in all five subsectors. When own-trade-weighted averages are compared, it will be seen that on leading U.S. exports to the Community that the United States has higher averages in two subsectors, the Community in three. On leading U.S. imports from the Community, it will be seen that the own-trade-weighted average is higher in all cases for the Community.

Chart 4-GG presents the five leading U.S. exports and imports from the United Kingdom. On all exports, the U.S. duty range is higher. On imports, the U.S. range is higher in four subsectors,

the U.K. range is higher in one. When comparison is between own-trade-weighted averages, the U.S. average is higher in four subsectors; the U.K. average is higher in one subsector. On leading U.S. imports, the U.S. average is higher in three subsectors; the U.K. average is higher in two.

Possible disparities at the 4-digit BTN level

In the preceding discussion disparities have been viewed at the subsector level of aggregation where tariff range and weighted averages have been compared. Similar comparisons of duty rate ranges at the 4-digit BTN heading level discloses, in greater detail, the most likely areas where disparities may be found. The comparison which follows is presented in two parts, one covering the 919 industrial headings (BTN Chapters 25-99), and the other covering the 178 agricultural headings (BTN Chapters 01-24).

Tables 4-T and 4-U summarizing detailed data shown in appendix tables 4-F through 4-M provide a summary count of the BTN headings where possible disparities in duty rates may be found among the tariff schedules of Canada, the United States, Japan and the European Community. The range of each country's duty rates within each heading is compared, and where (on the basis of the Kennedy Round definition 1/) a disparity may possibly exist, it has been listed under the country with the high end of one rate range.

---

1/ The rate relationship is that the higher rate is 100 percent greater than the lower rate and there is an absolute difference of at least 10 percentage points between the rates.

Table 4-T.--BTN headings where possible rate disparities may exist among industrial product tariffs of Canada, United States, Japan and the European Community

A. Possible disparities in the tariff of Canada

Range of possible rate differences (in percentage points)	Number of 4-digit BTN headings where a possible disparity may exist between tariffs of Canada and--		
	United States	Japan	European Community
10-19-----	508	387	450
20-29-----	48	23	24
30-39-----	3	3	4

40-49-----	5	5	-
50 and over-----	7	7	5
Total number-----	86	90	40
Percent of all agricultural product headings (178)-----	48.3	50.6	22.5

D. Possible disparities in the tariff of the European Community

Range of possible rate differences (in percentage points)	Number of 4-digit HTN headings where a possible disparity may exist between tariffs of the EC and--		
	Canada	United States	Japan
10-19-----	33	46	26
20-29-----	19	19	8
30-39-----	1	4	1
40-49-----	1	1	1
50 and over-----	5	5	3
Total number-----	59	75	39
Percent of all agricultural product headings (178)-----	33.1	42.1	21.9

Source: Developed from national tariffs.

An example will prove helpful. If the United States range of duty rates for a particular 4-digit BTN heading were between 5 and 10 percent and the Canadian range between 5 and 15 percent, a possible disparity would be found to exist -- Canada, 15 percent; the United States, 5 percent. In this circumstance the high of the Canadian range in comparison with the low of the United States meets the minimal 2:1 criterion and there is a 10-percentage-point spread between these rates. All measurements in the appendix material and in these summarizing tables have been made at the maximum level of possible disparity.

Tables 4-T and 4-U and the appendix tables 4-F through 4-M are entitled "possible" disparities because the data relate to potential circumstances only. If, in the foregoing example, (U.S. rates, 5-10 percent; Canadian rates, 5-15 percent) the rate provisions of the two countries were compared in detail item-by-item, it might be found that the rate differences required in the definition used for a disparity do not actually exist, or that all likely trade is occurring under tariff lines which for the U.S. range between 5-8 percent and for Canada, 5-10 percent. <sup>1/</sup> While in this situation the high of Canada, 10 percent, is double the low of the United States, 5 percent, there is not a 10-percentage-point spread between the rates. Thus, there would be no disparity. Tables 4-T

---

<sup>1/</sup> In constructing concordances between tariffs, and hence, rate comparisons, relationships which have little, if any commercial significance invariably appear. All tariff nomenclatures provide for every possible product, whether or not the item may be commercially produced or traded.

and 4-U and the appendix material from which they are drawn have been developed from tariff line information only. The possible difference between tariff lines and trade is underscored in the information earlier introduced, namely, that 90 percent of United States imports enter under 500 of the 6,760 lines to be found in the U.S. tariff schedules.

From table 4-T it will be seen that Canada has an exceptionally high proportion of possible disparities on industrial products with respect to the United States and a high proportion with respect to Japan and to the European Community. The United States has a slightly lower proportion of possible disparities with respect to Canada than with respect to Japan and the European Community. Japan has a somewhat greater proportion of possible tariff disparities with respect to the United States than with respect to Canada and the European Community. While possible disparities in the case of the European Community are minor by comparison with the other countries, it will be noted that the Community has a somewhat greater proportion with the United States than with Canada and Japan. If the percentage proportion of BTN headings where possible disparities may exist between tariffs of the four countries from table 4-T is juxtaposed, one finds the following possible disparity relationships:

Canada with respect to:	Percent of industrial BTN headings
-------------------------	---------------------------------------

United States	60.9
Japan	45.0
European Community	52.1

United States with respect to:	
--------------------------------	--

Canada	28.4
Japan	33.7
European Community	38.6

Japan with respect to:	
------------------------	--

Canada	16.3
United States	25.6
European Community	19.2

European Community with respect to:	
-------------------------------------	--

Canada	3.4
United States	8.3
Japan	1.8

As observed earlier, table 4-U is considerably less informative than table 4-T because, in the case of agriculture, tariffs are but one of several highly restrictive barriers to trade and the tariff story frequently is a less significant part of a larger whole. The variable levies of the European Community could not be taken into consideration in comparing the rate ranges on agricultural products. In table 4-T, it will be observed that possible disparities so far as fixed tariffs are concerned do not show the marked differences in national pattern that were true of industrial products. If the percentage proportion of BTN headings where possible disparities may exist for the four countries

is juxtaposed, the greater similarity will be seen:

Canada with respect to:	Percent of agricultural BTN headings
-------------------------	---

United States	46.1
Japan	20.8
European Community	21.9

United States with respect to:

Canada	36.0
Japan	26.4
European Community	29.8

Japan with respect to:

Canada	48.3
United States	50.6
European Community	22.5

European Community with respect to:

Canada	33.1
United States	42.1
Japan	21.9

### Trade Complaints Against Import Duties

In the course of the present investigation, the Tariff Commission solicited information from the public concerning trade barriers. The request to the public emphasized the Commission's need for specific information relating to nontariff measures which obstruct or distort trade and stated that the Commission already had a large amount of data on tariff barriers of the principal trading nations. It was indicated, however, that submissions on either tariff or nontariff trade barriers would be useful for purposes of the investigation.

Two categories of complaints dealing with tariffs were submitted to the Commission: One was concerned only with the height of the duty; the second, in addition to the duty, was concerned with discriminatory tariff treatment by a country among foreign suppliers.

Testimony of the significance attached to tariffs as trade barriers by traders is the fact that the complaints against nondiscriminatory import duties constituted the second largest category of complaints submitted to the Commission, and discriminatory import duties made up the tenth largest group of complaints. When combined, complaints against nondiscriminatory and discriminatory tariffs together greatly exceeded the number of complaints submitted against any other type of trade barrier.

# Tariff complaints, by country

Table 4-V gives the number of complaints submitted against tariffs by country. Every country which drew 10 or more complaints in either the nondiscriminatory or discriminatory category is named in the table.

Table 4-V.--Number of complaints made against import duties, by country

Country	Total		Nondiscriminatory import duties		Discriminatory import duties	
	Number	Percent	Number	Percent	Number	Percent
Developed countries, total-----	242	46.2	156	45.2	86	48.0

Total all countries-----	524	100.0	345	100.0	179	100.0

1/ Includes Iceland, Austria, Denmark, Finland, Norway, Sweden, Switzerland, Portugal, and complaints against EFTA without specifying a country. (With respect to development status, Portugal is a "borderline" country, but is usually considered a "developing" country. Portugal is listed here among developed countries only because of membership in the EFTA.)

2/ Includes Netherlands, Belgium and Luxembourg, France, West Germany, and Italy.

3/ Includes Ireland, New Zealand, South Africa, complaints against developed countries without specifying a country.

Source: Compiled from submissions to the Tariff Commission.

Note.--Due to rounding, percents may not add to totals shown.

Some 46 percent of the complaints concerning tariff treatment were against developed countries, 53 percent against the developing nations. The largest number of complaints against a single tariff were the 31 objections lodged against the level of the European

Community's Common External Tariff (with no mention of discrimination); 18 additional complaints against the Community dealt with the discriminatory aspects of the duty-free treatment for intra-EC trade or EC preferential treatment for other third countries. It is interesting that the total number of complaints lodged against the EFTA member countries (many of which have "low" tariff averages) significantly exceeded complaints against the Community, and that slightly over half of the complaints against EFTA countries are in the discriminatory category, whereas only about one-third of complaints against the European Community were concerned with the discriminatory aspect.

#### Tariff complaints, by product

The distribution of the complaints by product sector can be seen in table 4-W. Eighty-four percent of U.S. trade is in industrial products, 16 percent in agricultural items. It is seen from the table that almost 88 percent of the complaints against tariff treatment were concerned with industrial products, and about 12 percent with the agriculture sector. Transport equipment and chemicals were the industrial sectors drawing the largest number of complaints; in the agricultural area, tariff treatment of beverages and foodstuffs drew the most complaints. <sup>1/</sup> The proportion of complaints against discriminatory tariff treatment was substantially greater in industrial products than in the agricultural area.

---

<sup>1/</sup> Complaints against variable levies are discussed in Chapter VII.

Table 4-W.--Number of complaints made against import duties, by product sectors

29.16	Alcohol, aldehyde, ketone, phenol acids, derivatives-----	8-13	4,700			2-26	5,375		
29.17	Sulphuric esters and their salts, derivatives-----	15-15	5			5-20	194		
29.18	Nitrous and nitric esters, derivatives-----	8-15	38			5-20	0		
29.19	Phosphoric esters and their salts, derivatives-----	13-15	1,230			5-23	47		
29.22	Amine-function compounds-----	11-15	5,950	4-8	16,307	5-30	7,762		
29.23	Single or complex oxygen-function amino-compounds-----	15-15	3,609			5-30	12,957		
29.24	Quaternary ammonium salts and hydroxides-----	5-15	224			5-20	8		

See footnote at end of table.

APPENDIX TABLE 4-F--Continued

Industrial sector BTN headings where possible rate disparities may exist in the Canadian tariff compared with tariffs of the United States, Japan and the European Community <sup>1/</sup>

HTS number	Abbreviated BTN description	Canada		European Community		United States		Japan	
		Tariff range	MFN imports 1,000 ad val.	Tariff range	MFN imports 1,000 ad val.	Tariff range	MFN imports 1,000 ad val.	Tariff range	MFN imports 1,000 ad val.
29.25	Amide-function compounds-----	13-15	1,578			5-30	13,551		
29.26	Imide-function and imine-function compounds-----	9-15	714			5-20	1,335	5-13	1,564
29.27	Nitrile-function compounds-----	15-15	1,127			5-20	8,897		
29.29	Organic derivatives of hydrazine or hydroxylamine-----	15-15	335			5-20	404		
29.31	Organo-sulfur compounds-----	14-15	3,886			4-20	8,736		
29.32	Organo-arsenic compounds-----	15-15	15			5-20	0		
29.33	Organo-mercury compounds-----	15-15	10			5-20	0		
29.34	Other organo-inorganic compounds-----	7-18	1,466			5-20	1,627		
29.35	Heterocyclic compounds; nucleic acids-----	5-15	14,571	5-13	94,739	5-30	30,172	3-20	31,213
29.37	Sulfones and sulfates-----	15-15	2			5-20	0		
29.38	Provitamins and vitamins, derivatives-----	15-18	7,119	4-9	22,049	2-19	9,911	8-15	6,988
29.39	Hormones, derivatives-----	14-15	3,028			2-19	30,525		
29.40	Enzymes-----	5-15	2,637			5-5	2,690		
29.41	Glycosides and their salts and esters-----	15-15	161			5-19	4		
29.42	Vegetable alkaloids and their salts and esters-----	13-15	1,405	5-9	22,872	2-29	9,416	5-20	2,020
29.44	Antibiotics-----	15-18	6,783	5-11	47,359	2-19	11,550	8-10	14,531
30.01	Organotherapeutic glands and extracts-----	15-18	5,662	2-6	6,530	0-0	13,061	5-5	1,202
30.02	Antisera-----	15-15	4,549			5-5	2,470	0-0	856
30.03	Medicaments-----	13-80	15,565	6-17	84,066	0-26	11,952	8-25	62,087
30.04	Wadding, gauze, and bandages-----	10-23	3,119	7-7	1,807	4-22	475	10-10	1,153
30.05	Other pharmaceutical goods-----	8-18	4,846	8-8	2,127	3-20	310		
31.03	Mineral or chemical fertilisers, phosphatic-----	14-14	2,997	2-3	7,989	0-0	6,181		
32.02	Tannins (tannic acids)-----	15-15	57	5-5	164	3-19	497	5-8	25
32.03	Synthetic tanning substances-----	15-15	413	5-5	631	5-17	81	3-16	1,196
32.04	Coloring matter of vegetable origin or of animal origin-----	15-15	267	2-5	736	3-30	549	3-3	402
32.05	Synthetic organic dyestuffs; optical bleaching agents-----	5-15	24,802			4-30	26,434		
32.07	Other coloring matter-----	5-15	7,399	5-9	12,456	1-16	3,132	5-13	767
32.08	Prepared pigments, glass frit-----	15-15	940	3-8	2,905	4-34	154	5-8	1,256
32.09	Varnishes and lacquers; distempers; paints-----	10-18	11,724	7-8	19,611	4-30	1,656	4-13	10,471
32.11	Prepared driers-----	15-15	64			5-5	0		
32.12	Glaziers' putty-----	15-18	1,559	5-5	3,990	3-13	38	8-8	556
32.13	Writing ink-----	15-15	3,105			2-12	3,530		
33.06	Perfumery, cosmetics and toilet preparations-----	13-25	8,212	7-8	12,919	4-20	12,433	8-25	2,406
34.01	Soap-----	3-10	936	8-8	1,700	4-8	1,722		
34.02	Organic surface-active agents-----	15-18	12,713	8-8	17,455	5-12	3,111		
34.04	Artificial waxes-----	10-15	1,328	5-5	3,661	5-20	0		
34.05	Pollishes and creams-----	18-18	2,264	6-7	3,023	3-16	578	5-10	1,025
34.06	Candles, tapers, and night lights-----	20-20	786	8-8	2,158	10-10	3,440	8-8	6
34.07	Modelling pastes-----	18-18	579	7-7	231	5-18	0		
35.01	Casein and derivatives-----	32-32	41	2-14	10,916	3-8	24,945	10-10	15,981
35.02	Albumins and derivatives-----	10-20	123	10-12	3,921	5-37	519	8-20	210
35.03	Gelatin and derivatives; some glues-----	15-20	2,147	5-8	2,986	5-10	10,813	5-20	974
35.06	Prepared glues, n.s.p.f-----	10-20	2,415	6-10	1,322	3-16	0	3-10	318
36.02	Prepared explosives-----	13-20	179	8-8	1,412	1-20	10,793	10-10	1
36.03	Mining, blasting and safety fuses-----	20-20	5	6-6	204			10-10	3
36.05	Pyrotechnic articles-----	20-20	300	7-7	1,540	1-26	3,920	8-8	298
36.06	Matches-----	10-15	401			1-8	1,511		
36.08	Other combustible preparations and products-----	9-15	140			5-18	0		
37.01	Photographic plates and films, unexposed, of material other than paper-----	13-13	11,058			3-8	15,690		
37.02	Film in rolls-----	10-18	12,414	8-8	24,424	3-5	21,719		
37.03	Sensitized paper, not developed-----	10-18	7,638			4-5	11,310	8-40	3,000
37.05	Plates, film exposed and developed, negative or positive-----	9-15	4,133	3-5	2,445	4-4	488		
37.07	Other motion picture film, exposed and developed-----	10-17	10,151	2-6	11,973	4-4	6,019	2-18	3,289
37.08	Chemical products and flashlight materials for photography-----	15-15	5,618			2-18	178		
38.03	Activated carbon, bauxite, clay, etc-----	10-15	1,806					5-10	1,472
38.04	Ammoniacal gas liquors-----	15-15	0	2-5	282	4-5	0	3-1	0
38.06	Concentrated sulfite lye-----	15-15	73	5-5	2,391	3-5	778	3-3	567
38.07	Spirits of turpentine produced by distillation-----	15-15	936	3-4	5,461	5-5	113	3-5	698
38.11	Disinfectants, insecticides, etc., for retail sale-----	8-15	30,857	4-6	26,161	2-16	643		
38.13	Pickling preparations for metal surfaces-----	15-18	1,614	4-7	2,454	5-16	0		
38.14	Antiknock preparations, oxidation inhibitors, etc-----	7-15	6,165	5-11	23,421	5-16	301		
38.15	Prepared rubber accelerators-----	15-15	222			5-16	1,154		
38.17	Preparations and charges for fire extinguishers-----	15-15	155			5-5	75		
38.18	Composite solvents and thinners-----	6-15	618			4-16	75		
38.19	Chemical products and preparations, n.s.p.f-----	1-18	78,452	2-9	81,845	1-26	11,900	5-13	33,061
39.01	Condensation, polycondensation products-----	8-28	46,026	7-14	71,798	3-23	8,623	5-15	20,809
39.02	Polymerisation products-----	8-23	86,987	7-12	86,091	3-21	39,724	8-18	17,076
39.03	Regenerated cellulose, derivatives of cellulose-----	10-18	14,865	6-12	29,618	3-19	6,668	5-14	2,675
39.04	Hardened proteins-----	10-18	233	5-5	1,252	5-10	2,271	8-8	25
39.06	Other high polymers, artificial resins-----	10-15	591	5-10	5,442	4-30	413		
39.07	Articles of regenerated cellulose, hardened proteins, etc-----	8-25	54,071	7-12	37,436	4-35	57,081	10-15	3,920
40.02	Synthetic rubber latex and rubber-----	3-18	31,190	4-5	87,001	3-16	20,799	8-8	29,158
40.05	Plates, sheets, and strip, of unvulcanized rubber-----	18-18	797	3-6	2,008	3-6	386	8-8	232
40.06	Unvulcanized rubber in other forms or states-----	15-18	4,087	6-7	2,174	3-13	145	3-8	509
40.07	Vulcanized rubber thread and cord-----	10-18	1,081	8-10	1,128	7-15	58	8-8	1
40.08	Plates, sheets, and rods, of unhardened vulcanized rubber-----	15-23	9,386	6-9	5,249	6-38	209	8-10	191
40.09	Piping and tubing, of unhardened vulcanized rubber-----	10-20	4,592	7-7	9,239	4-10	4,672	10-10	1,000
40.10	Transmission belting, of vulcanized rubber-----	10-20	6,329	10-10	7,355	6-21	2,361	8-8	520
40.11	Rubber tires-----	10-18	51,255	8-9	42,506	4-15	88,301	8-15	1,064

See footnote at end of table.

APPENDIX TABLE 4-F--Continued

Industrial sector BTN headings where possible rate disparities may exist in the Canadian tariff compared with tariffs of the United States, Japan and the European Community 1/

BTN number	Abbreviated BTN Description	Canada		European Community		United States		Japan	
		Tariff range	MFN imports	Tariff range	MFN imports	Tariff range	MFN imports	Tariff range	MFN imports
		Percent ad val.	1,000 dollars	Percent ad val.	1,000 dollars	Percent ad val.	1,000 dollars	Percent ad val.	1,000 dollars
40.12	Hygienic and pharmaceutical articles of unhardened vulcanized rubber-----	18-18	938			4-9	584	8-8	56
40.13	Wearing apparel of unhardened vulcanized rubber-----	23-25	1,268	8-10	3,235	5-35	3,072	8-8	78
40.14	Other articles of unhardened vulcanized rubber-----	13-20	31,375	6-8	21,146	2-13	10,394	8-10	1,637
40.15	Hardened rubber in bulk, plates, and rods; scrap-----	15-15	318	4-4	228				
40.16	Articles of hardened rubber-----	18-18	76	8-8	165	4-12	946	8-8	0
41.02	Bovine cattle leather and equine leather-----	8-20	3,274	8-8	19,134	4-9	35,171		
41.03	Sheep and lamb skin leather-----	8-18	9,684	3-5	22,953	5-6	6,587	8-20	4,754
41.04	Goat and kid skin leather-----	10-18	406	4-5	25,901	4-6	13,359	8-20	808
41.05	Other kinds of leather-----	8-18	1,153	4-5	13,830	5-6	7,833	8-13	1,832
41.06	Chamois-dressed leather-----	10-18	1	5-5	1,597	5-8	3,783		
41.09	Parings and other waste of leather-----	18-18	39	0-0	1,134	0-0	0	5-5	0
41.10	Composition leather-----	20-20	292	5-5	152	3-4	1,731	8-8	933
42.01	Saddlery and harness, of any material-----	18-20	1,274	9-9	467	6-6	4,971		
42.02	Travel goods, cases of leather-----	18-20	14,599	8-15	10,747	4-21	72,569	10-20	3,165
42.03	Wearing apparel of leather-----	10-25	7,437	8-13	6,349	4-87	40,263	10-20	615
42.04	Articles of leather for machinery-----	18-20	264	5-8	897	4-10	618	8-23	387
42.05	Other articles of leather-----	18-18	256	7-7	1,327	3-14	3,648		
43.02	Furkins, tanned or dressed-----	8-23	7,854	5-9	22,951	3-19	7,519		
43.03	Articles of furkins-----	23-23	921	7-10	5,741	9-19	3,028		
44.02	Wood charcoal-----	4-18	1,197	7-7	1,120	0-0	722	0-0	1,030
44.03	Wood in the rough-----	18-18	26,825	3-3	146,511	0-0	29,190	5-5	837,065
44.10	Wooden sticks-----	5-15	699	3-3	69	0-0	507		
44.13	Wood, planed, tongued, grooved, etc-----	5-15	16,676	5-5	2,417	1-8	310,065	3-10	578
44.16	Cellular wood panels-----	15-15	1,358	5-5	22				
44.19	Wood headings and moldings-----	10-15	2,060			2-13	12,366		
44.21	Complete wooden packing cases, boxes, etc-----	15-20	1,404	10-12	434	8-17	2,017	8-8	5
44.22	Casks, barrels, vats, and buckets-----	15-15	4,450			4-13	441	5-8	74
44.23	Builders' carpentry and joinery-----	8-18	5,113	6-7	9,100	5-20	5,919	8-8	180
44.24	Household utensils of wood-----	15-16	1,534	8-8	2,928	7-26	15,349	10-10	8
44.25	Wooden tools, tool bodies, and tool handles-----	10-15	1,169			4-22	4,568	5-8	6
44.27	Standard lamps, furniture, of wood-----	15-15	1,610			5-17	16,324		
44.28	Other articles of wood-----	15-20	2,757	4-7	4,320	3-20	42,112	10-15	129
46.02	Flaxing materials bound together in parallel strands-----	10-20	200	5-10	3,195	3-29	2,025	8-15	1,044
46.03	Basketwork and wickerwork-----	13-18	446			4-25	13,170		
48.01	Paper and paperboard in rolls or sheets-----	3-18	42,225	3-12	423,381	1-34	910,663	6-20	10,210
48.02	Handmade paper and paperboard-----	20-20	0	8-8	330	3-3	497	8-8	10
48.03	Parachute or grease proof paper-----	15-18	333			3-8	2,404	8-8	40
48.04	Composite paper or paperboard-----	13-20	1,085			3-10	28	8-8	34
48.05	Paper and paperboard, corrugated, crimped, etc-----	15-18	770			3-25	1,099	8-8	82
48.07	Paper and paperboard, impregnated, coated, and colored-----	5-20	17,440	10-12	50,316	1-25	5,089	5-15	4,059
48.11	Wallpaper and linoleum-----	15-15	2,036			1-8	3,630	5-8	228
48.12	Floor coverings prepared on base of paper or paperboard-----	18-20	1,128			5-11	500	8-8	9
48.13	Carbon and other copying papers-----	8-18	1,343			8-10	254	8-8	63
48.14	Writing blocks and envelopes-----	15-18	1,826			4-10	856	8-8	45
48.15	Other paper and paperboard, cut to size or shape-----	15-18	3,203	7-12	16,619	1-10	3,397	5-8	2,052
48.16	Boxes, bags, and other packing containers, of paper-----	15-18	11,974			3-9	1,631		
48.17	File boxes and letter trays, of paper or paperboard-----	18-20	254			3-9	54	7-7	0
48.18	Registers, exercise books, and notebooks of paper-----	10-18	1,199			4-10	4,065	8-10	222
48.19	Paper and paperboard labels-----	18-20	2,525			3-10	449	8-8	91
48.20	Robbins, spools, cups, and similar supports of paper pulp-----	18-18	1,031			4-9	683	8-8	3
48.21	Other articles of paper pulp, paper, and paperboard-----	10-20	12,964	7-14	11,333	4-14	11,293	8-10	1,234
49.01	Printed books and booklets-----	10-10	106,769	0-0	56,385			0-0	19,055
49.02	Newspapers and journals-----	10-10	58,848	0-0	11,261	0-0	7,360	0-0	2,226
49.03	Children's picture books-----	10-20	1,465			0-0	676	0-0	135
49.05	Maps and charts-----	18-25	1,606	7-7	1,737	9-9	1,661	0-0	472
49.06	Plans and drawings-----	9-20	6,191	0-0	2,308	2-4	1,395	0-0	508
49.07	Unused postage-----	20-20	5,046	3-8	132	1-8	2,633	0-0	328
49.08	Transfers-----	18-20	871	8-8	2,829	1-10	552	8-8	61
49.09	Picture postcards-----	20-20	1,376			4-10	2,235	8-8	185
49.11	Other printed matter-----	9-25	21,667	9-9	14,800	1-8	11,301	8-8	1,435
50.07	Silk yarn-----	15-15	66	5-10	181				
50.09	Woven fabrics of silk-----	10-32	2,090	8-14	11,825	11-19	26,943	10-13	13,210
51.01	Yarn of manmade fibers, not put up for retail sale-----	18-22	30,358	3-11	58,128	11-64	28,048	8-25	2,394
51.04	Woven fabrics of manmade fibers-----	5-32	31,126	13-15	22,125	13-38	60,217	8-25	3,734
53.06	Yarn of carded sheep's or lambs' wool-----	8-16	236	5-8	956			5-5	72
53.07	Yarn of combed sheep's or lambs' wool-----	8-16	1,010	5-10	8,476			5-5	942
53.08	Yarn of fine animal hair-----	8-16	398	4-4	4,293	5-30	2,806	5-5	153
53.09	Yarn of horsehair-----	23-23	152	5-5	20	5-5	0	5-5	5
53.10	Yarn of sheep's or lambs' wool, of horsehair-----	16-16	580			5-30	4,071		
53.11	Woven fabrics of sheep's or lambs' wool or of fine animal hair-----	10-36	19,120	13-18	45,268	16-100	88,807	10-16	21,632
54.05	Woven fabrics of flax or of ramie-----	20-20	358			3-68	25,070		
55.05	Cotton yarn, not for retail sale-----	10-18	10,812	4-8	12,701	4-20	18,716	6-11	7,607
55.06	Cotton yarn, put up for retail sale-----	18-18	1,756					6-6	185
55.07	Cotton gauze-----	18-20	4,169	9-9	740	7-36	0	7-14	11
55.08	Terry towelling-----	18-20	547					7-18	14
55.09	Other woven fabrics of cotton-----	3-23	38,303			7-36	129,462	7-18	6,397
56.05	Yarn of manmade fibers, not for retail sale-----	18-18	5,552					8-25	125
56.07	Woven fabrics of manmade fibers-----	8-32	39,226	15-16	21,076	13-38	252	8-25	2,543

See footnote at end of table.

APPENDIX TABLE 4-F--Continued

Industrial sector HTS headings where possible rate disparities may exist in the Canadian tariff compared with tariffs of the United States, Japan and the European Community 1/

HTS number	Abbreviated HTS description	Canada		European Community		United States		Japan	
		Tariff range	MFN imports	Tariff range	MFN imports	Tariff range	MFN imports	Tariff range	MFN imports
		Percent ad val.	1,000 dollars	Percent ad val.	1,000 dollars	Percent ad val.	1,000 dollars	Percent ad val.	1,000 dollars
57.06	Yarn of jute	18-20	111	8-8	635	7-13	477	10-10	50
57.07	Yarn of other vegetable textile fibers	15-20	67	5-5	6,505	10-10	843	4-4	275
57.09	Woven fabrics of true hemp	20-20	17			3-23	0	8-8	1
57.11	Woven fabrics of other vegetable textile fibers	20-20	961	10-10	436	3-14	687	5-5	28
57.12	Woven fabrics of paper yarn	8-20	626	9-9	102	9-9	821	8-8	0
58.01	Carpets, knotted	21-21	861			6-17	12,753		
58.02	Other carpets and rugs	10-33	12,795	11-23	21,690	6-30	30,931	15-21	2,778
58.04	Woven pile fabrics and chenille fabrics	20-45	13,390			6-38	13,051	7-18	7,381
58.05	Narrow woven fabrics	10-32	6,913	7-14	3,830	6-25	5,821	10-14	419
58.06	Woven labels	20-20	100	10-10	344	9-19	1,640	10-10	10
58.07	Chenille yarn and gimped yarn	10-23	1,113	7-8	3,033	2-30	829		
58.08	Tulle and other net fabrics, plain	10-20	509	10-11	588			10-13	107
58.09	Tulle and other net fabrics, figured	10-20	3,302			10-45	6,221		
58.10	Embroidery	10-25	2,875	9-13	18,869				
59.01	Wadding and articles of wadding	15-25	396	4-8	4,830	7-25	393	5-5	283
59.02	Felt and articles of felt	18-25	643	10-12	1,372	4-31	1,252	11-14	574
59.03	Bonded fiber fabrics and articles	15-25	2,273	12-12	3,841			10-14	488
59.04	Twine, cordage, ropes, and cables, plaited	10-20	6,532			3-28	39,580	9-10	246
59.05	Rope and twine, cordage, or rope	23-23	3,317	10-14	384	4-53	1,102	5-10	165
59.07	Textile fabrics coated with gum	18-23	1,071	11-11	750	6-26	360	7-11	8
59.08	Textile fabrics impregnated with preparations of cellulose derivatives	23-28	13,121	14-14	9,232	6-32	886	8-8	339
59.09	Textile fabrics impregnated with oil	20-20	0	7-8	105	5-14	1	8-8	4
59.10	Linoleum	20-20	312	8-8	757	6-11	1,880	10-10	101
59.11	Reinforced textile fabrics	13-32	2,861	7-14	6,951	6-38	1,129	8-8	134
59.12	Textile fabrics otherwise impregnated or coated	10-32	14,585	7-7	1,548	7-19	34	8-10	92
59.13	Elastic fabrics and trimmings	20-36	2,539	11-11	1,147	15-21	3,162	8-11	62
59.15	Textile hosepipling	20-25	364	11-11	584			8-11	60
59.16	Transmission belting, of textile material	20-20	415	8-8	1,074	6-21	1,609	8-11	66
59.17	Textile fabrics and textile articles for machinery	5-25	1,440	4-10	9,812	6-38	4,390	8-11	1,233
60.01	Knitted or crocheted fabric, not elastic or rubberized	20-28	14,915	13-14	15,879	6-40	13,388	8-25	4,107
60.02	Gloves, mittens, and mitts, knitted or crocheted	25-25	4,615			10-64	8,235	10-14	182
60.03	Stockings, knitted or crocheted	25-28	2,439	13-13	7,996	10-50	3,650	10-15	477
60.04	Undergarments knitted or crocheted	25-28	5,537			10-45	20,600	14-21	510
60.05	Outer garments knitted or crocheted	25-28	36,934	11-18	53,139	6-43	228,037		
60.06	Knitted or crocheted fabric and articles, elastic or rubberized	20-28	1,247	11-16	2,447	6-40	900	10-14	12
61.01	Men's and boys' outer garments	10-25	27,685			8-43	115,719		
61.02	Women's, girls', and infants' outer garments	15-25	22,898	11-17	50,120	8-43	113,833		
61.03	Men's and boys' undergarments	23-25	14,821			3-43	30,857		
61.04	Women's, girls', and infants' undergarments	23-25	399			8-43	5,625		
61.05	Handkerchiefs	20-25	2,550	11-14	6,019	3-55	10,000	10-30	546
61.06	Shawls and scarves	20-25	1,244			8-31	15,383		
61.07	Ties	25-25	252	11-11	860	10-21	1,156		
61.09	Corsets	20-28	3,615	9-9	8,613	7-32	6,474	14-21	265
61.11	Made-up accessories for articles of apparel	15-25	1,148	11-11	518	6-38	667		
62.01	Traveling rugs and blankets	23-25	1,332	12-14	1,491	9-43	1,278	10-14	750
62.02	Bed linen and table linen, curtains	20-25	21,472			4-43	37,601	10-21	772
62.03	Sacks and bags, for packing of goods	13-25	182	8-20	20,173	4-40	1,115	8-20	144
62.04	Tarpaulins, sails, and tents	20-23	878			6-25	0	8-11	9
62.05	Other made-up textile articles	15-33	9,134	8-15	2,921	6-40	8,349	10-14	398
63.02	Used or new rags and scrap twine	5-23	5,275	0-0	26,562	2-11	7,643	10-10	632
64.01	Footwear with outer soles and uppers of rubber	20-25	6,757			6-38	55,613	10-10	3
64.02	Footwear with outer soles of leather or composition leather	23-25	42,086	8-20	35,422	3-20	199,793	10-30	2,065
64.04	Footwear with outer soles of other materials	20-20	2	7-7	1,260	7-13	1,075	10-10	35
64.05	Parts of footwear	18-25	1,902	7-9	3,637	4-5	1,860	8-20	356
65.01	Hat forms	20-20	349	8-8	1,008	8-65	1,256		
65.02	Hat shapes	8-25	336	5-7	727	8-29	2,910		
65.03	Felt hats	20-20	97	8-11	1,403	8-65	1,735		
65.05	Hats and other headgear, knitted or crocheted	20-28	1,936	10-10	1,809	8-43	8,974	13-13	152
65.06	Other headgear	18-25	1,143	10-10	1,967	5-15	7,318		
65.07	Headbands, covers, and hat frames	25-25	1,076	5-8	331	2-25	0	10-10	7
66.01	Umbrellas	20-20	454					10-10	19
66.02	Walking sticks	20-20	36	7-7	98	10-13	226	10-20	1
67.01	Skins and other parts of birds, and articles thereof	18-20	52	5-9	78	7-7	1,367	10-10	76
67.02	Artificial flowers and articles thereof	18-20	2,628					10-20	1,468
67.04	Wigs	8-25	4,241	8-8	3,874	7-25	74,855	10-10	526
68.02	Worked monumental or building stone; articles thereof	5-20	1,753	4-9	4,507	1-14	12,171	3-8	279
68.03	Worked slate and articles of slate	18-18	118	5-5	2,490	5-13	1,752	5-5	25
68.04	Millstones and grindstones	10-18	3,222	3-5	10,280	3-30	1,003	5-10	583
68.05	Hard polishing stones and oilstones	18-18	564	4-5	174	3-8	367	5-8	37
68.06	Natural or artificial abrasive powder or grain, in primary forms	10-18	3,645	5-5	6,472	3-3	4,293		
68.07	Slag wool; mixtures of heat-insulating mineral materials	15-20	2,094	4-5	5,050	8-8	1	8-8	365
68.08	Articles of asphalt or of similar material								
68.09	Panels, boards, and tiles, of vegetable fiber, wood, and straw	15-18	1,138	6-6	998	0-0	0	8-8	7
68.10	Articles of plastering material	15-18	487	4-4	837	5-6	687	8-8	84
68.11	Articles of cement	18-20	174	4-4	1,710	6-21	992	8-8	13
68.12	Articles of asbestos-cement	13-18	1,876	4-7	7,509	1-14	4,052	8-8	98
68.13	Fabricated asbestos and articles thereof	3-32	2,503	5-12	8,073	4-13	3,119	8-8	909
68.14	Friction material	13-20	3,792	8-8	7,251	4-13	14	8-15	1,388

See footnote at end of table.

APPENDIX TABLE 4-P--Continued

Industrial sector BTN headings where possible rate disparities may exist in the Canadian tariff compared with tariffs of the United States, Japan and the European Community 1/

BTN number	Abbreviated BTN description	Canada		European Community		United States		Japan	
		Tariff range	MFN imports	Tariff range	MFN imports	Tariff range	MFN imports	Tariff range	MFN imports
		Percent ad val.	1,000 dollars	Percent ad val.	1,000 dollars	Percent ad val.	1,000 dollars	Percent ad val.	1,000 dollars
68.15	Worked mica and articles of mica	18-18	653	5-8	1,264			3-3	14
68.16	Articles of stone or of mineral substances, n.s.p.f.	5-20	1,551	6-9	10,364	4-14	3,707	8-8	1,193
69.02	Refractory bricks, blocks, and tiles	10-18	18,030	4-7	18,789	5-13	5,444	5-5	958
69.03	Other refractory goods	10-18	1,996			5-23	1,228		
69.04	Building bricks	10-13	1,698			3-3	1,011		
69.05	Roofing tiles	18-18	14	4-5	747	6-14	113	5-5	15
69.06	Piping, conduits, and guttering of minerals	18-20	17	4-8	455	8-8	128	5-5	13
69.07	Unglazed sets, hearth, and wall tiles	20-20	24	8-8	1,944			5-5	7
69.08	Glazed sets, hearth, and wall tiles	20-20	5,503	9-9	10,382			5-5	16
69.10	Sinks, washbasins, and bathtubs	20-20	1,286					8-8	59
69.11	Tableware of porcelain or china	10-20	4,130					8-8	66
69.12	Tableware of other kinds of pottery	20-20	2,673	8-16	7,011	3-60	23,097	8-8	172
69.13	Statuettes	18-20	3,940	8-20	4,187	3-23	24,351	8-8	282
69.14	Other articles of pottery, china, and ceramic materials	20-20	126	8-15	571			8-8	26
70.01	Glass in balls, rods, and tubes, unworked	5-18	3,782	7-7	2,147	7-18	3,374	5-10	961
70.02	Cast, rolled and blown glass cut to shape	8-18	2,968	8-8	863	8-22	2,770		
70.08	Safety glass consisting of toughened glass	13-20	207	9-9	1,096	9-11	3,428		
70.09	Glass mirrors	15-20	5,649			10-18	3,377		
70.10	Carboys, bottles, and containers of glass	15-20	15,694	10-10	4,231	2-16	2,348	8-8	74
70.13	Glassware of kind used for table and office purposes	15-20	15,963					10-15	1,581
70.14	Illuminating glassware	9-20	6,378	9-10	6,907			10-10	211
70.15	Clock or watch glasses	18-18	7	8-8	173	8-24	238	8-10	59
70.16	Bricks, tiles, and articles of pressed or molded glass	18-18	440	8-8	1,150				
70.17	Laboratory, hygienic, and pharmaceutical glassware	10-20	7,383	7-9	2,825	6-21	1,528	8-10	295
70.18	Optical glass	18-18	1,527					8-10	785
70.19	Glass beads, imitation pearls, and ornamental glass	10-18	119	5-12	6,336	4-50	12,983	8-10	767
70.20	Glass fiber, yarns, fabrics, and articles thereof	18-32	4,914	11-13	7,559	3-32	1,033	10-13	3,906
70.21	Other articles of glass	13-20	990	9-9	3,465	7-20	916	8-20	506
71.05	Unwrought or semifinished silver	20-20	32,088	2-7	124,223	1-25	164	3-10	12,977
71.06	Rolled silver, unwrought or semifinished	8-18	76	5-7	62				
71.10	Rolled platinum, unwrought or semifinished	18-18	1,528			8-8	12,690		
71.12	Articles of jewelry and parts thereof	13-25	2,436	5-9	4,111	9-20	2,002		
71.13	Articles of goldsmiths' or silversmiths' wares	20-23	1,054	5-8	1,132	8-35	20,268		
71.16	Imitation jewelry	13-25	6,912	12-18	6,462				
73.02	Ferroalloys	3-18	6,858	4-10	57,242	3-10	53,393	5-10	17,894
73.05	Iron and steel powders	18-18	510	3-4	4,194	0-10	2,339	5-6	1,890
73.10	Bars and rods, of iron or steel	3-18	36,203	5-7	17,442	3-9	158,883	8-8	3,540
73.11	Angles, shapes, and sections, of iron or steel	2-18	39,935	5-7	17,569	2-8	152,087	8-8	2,012
73.13	Sheets and plates, of iron or steel	3-18	74,546	6-8	79,004	6-12	399,595	8-15	428
73.15	Alloy steel and high carbon steel	3-13	73,904	3-8	122,160	2-12	224,805		
73.16	Railway and tramway track construction material of iron and steel	3-18	1,606	3-9	2,159	1-10	1,893	8-8	354
73.18	Tubes, pipes, and blanks of iron or steel	5-18	47,761			2-13	163,139	8-12	2,269
73.20	Tube and pipe fittings, of iron or steel	10-18	22,210			3-12	17,587	8-10	1,343
73.21	Structures, complete or incomplete, of iron or steel	10-18	24,539	6-6	15,750	2-9	8,674	5-8	1,613
73.22	Reservoirs, tanks, and vats, of iron or steel	10-20	1,483	6-6	2,610	7-7	847	5-8	299
73.23	Casks, drums, cans, and boxes, of sheet or plate iron or steel	5-18	6,099	6-7	6,601	5-8	4,698	8-8	85
73.24	Compressed gas cylinders	18-18	1,180	7-7	2,665	5-8	49	8-8	952
73.25	Stranded wire and cables, of iron or steel	10-20	4,127	9-9	3,617	4-10	23,945	8-8	659
73.26	Barbed iron or steel wire	10-10	603			0-0	9,344		
73.27	Gauze, cloth, and grill, of iron or steel wire	13-18	2,155			1-15	15,837	8-8	182
73.28	Expanded metal, of iron or steel	18-18	107	8-8	27			8-8	5
73.29	Chain and parts thereof, of iron or steel	5-18	11,408	7-7	8,812	1-13	11,990	8-8	1,300
73.31	Nails and tacks, of iron or steel	2-18	2,705	5-7	3,206	1-10	34,974	8-8	513
73.32	Bolts and nuts, of iron or steel	8-18	61,068	7-11	24,833	1-13	65,681	8-8	3,485
73.33	Needles for hand sewing, of iron or steel	20-20	126	6-8	327	10-19	2,969	5-5	9
73.34	Pins of iron or steel	5-20	381	8-8	785	8-23	2,517	5-5	36
73.35	Spring of iron or steel	15-18	2,578	7-7	6,969	4-10	2,732	8-15	812
73.36	Stoves, of iron or steel	10-20	12,064	7-7	2,436	6-10	4,198	8-8	3,447
73.37	Boilers and radiators of iron or steel	15-20	7,780	9-9	15,700	6-6	0	8-8	1,595
73.38	Articles of kind used for domestic purposes, of iron or steel	10-20	13,874	8-9	13,765	4-9	21,496	8-8	677
73.39	Iron or steel wool	15-15	32			5-9	2		
73.40	Other articles of iron or steel	5-28	56,530	6-8	24,365	0-22	35,313	8-10	2,888
74.01	Copper matte; unwrought copper; copper waste	5-18	25,683	0-0	878,560	2-7	542,655	3-9	371,846
74.03	Wrought bars and rods, of copper; copper wire	5-18	6,778	8-8	12,618	2-16	23,024		
74.04	Wrought plates and sheets of copper	5-18	6,850	8-8	6,322	2-16	34,727		
74.05	Copper foil	5-20	801	8-8	5,741	2-8	21,231		
74.07	Tubes, pipes, and blanks thereof, of copper	5-18	4,512	8-8	6,096	2-11	45,279		
74.08	Tube and pipe fittings, of copper	18-18	5,532	8-8	2,591				
74.10	Stranded wire and cables, of copper wire	18-18	415	8-8	87	4-10	1,142		
74.11	Gauze, cloth, and grill, of copper wire	15-18	870	8-8	1,109	6-25	1,183	8-10	192
74.13	Chain and parts thereof, of copper	18-18	24	7-7	131		47		
74.14	Nails and tacks, of copper	18-18	2	7-7	92	8-10	29		
74.15	Bolts and nuts of copper	18-18	792	5-7	1,181	2-12	1,839		
74.16	Spring of copper	18-18	11			5-10	0		
74.18	Other articles of kind used for domestic purposes, of copper	18-18	245	7-7	1,351	5-20	13,215		
74.19	Other articles of copper	5-18	7,235	7-7	3,335	7-22	4,130	8-25	740
75.01	Nickel matte, nickel speiss, unwrought nickel	18-18	25,942	0-0	128,280	2-9	235,347		

See footnote at end of table.

APPENDIX TABLE 4-F--Continued

Industrial sector BTN headings where possible rate disparities may exist in the Canadian tariff compared with tariffs of the United States, Japan and the European Community 1/

BTN number	Abbreviated BTN description	Canada		European Community		United States		Japan	
		Tariff range	MFN imports	Tariff range	MFN imports	Tariff range	MFN imports	Tariff range	MFN imports
		Percent ad val.	1,000 dollars	Percent ad val.	1,000 dollars	Percent ad val.	1,000 dollars	Percent ad val.	1,000 dollars
75.02	Wrought bars, rods, and shapes, of nickel-----	13-18	2,055	6-6	8,105	2-16	1,437		
75.01	Wrought plates and sheets, of nickel-----	18-18	8,403	1-7	8,927	2-16	7,910		
75.04	Tubes, pipes, and blanks thereof, of nickel-----	18-18	2,057	5-8	2,625	3-11	1,431		
75.06	Other articles of nickel-----	18-18	323	5-7	734	1-25	4,389		
76.02	Wrought bars, rods, and shapes, of aluminum-----	6-18	5,049			5-12	12,730		
76.03	Wrought plates of aluminum-----	5-18	49,767			6-12	28,109		
76.04	Aluminum foil-----	6-18	1,636			2-20	4,979		
76.05	Aluminum powders and flakes-----	15-15	223			4-10	434		
76.06	Tubes and pipes of aluminum-----	13-18	798			2-10	2,567		
76.07	Tube and pipe fittings, of aluminum-----	18-18	733	8-8	1,137				
76.08	Structures of aluminum-----	10-18	5,661	8-8	4,833				
76.09	Reservoirs, tanks, and vats, of aluminum-----	18-18	67	8-8	328	7-7	285		
76.10	Casks, drums, cans, and boxes, of aluminum-----	18-18	1,240			5-10	886		
76.11	Compressed gas cylinders of aluminum-----	18-18	1			5-5	0		
76.12	Stranded wire and cables, of aluminum-----	18-18	131			4-8	3,420		
76.13	Gause, cloth, grill, and netting of aluminum-----	18-18	92			5-13	1,403		
76.15	Articles of kind used for domestic purposes, of aluminum-----	18-18	2,365	8-8	1,976	5-26	5,672		
76.16	Other articles of aluminum-----	18-20	9,892	8-10	10,064	1-25	5,405	10-10	1,115
77.02	Wrought bars, rods, and shapes, of magnesium; wire-----	5-18	998	8-8	617	5-9	22		
78.01	Unwrought lead, waste-----	10-18	924	5-5	46,009	8-10	90,702	5-12	4,433
78.05	Tubes and pipes of lead; tube and pipe fittings-----	18-18	0			6-9	22		
78.06	Other articles of lead-----	18-18	164	6-9	256	5-9	4,964		
79.06	Other articles of zinc-----	18-18	1,516	8-8	474	5-10	260		
80.01	Unwrought tin; scrap-----	8-10	16,544	0-0	72,111	0-0	167,129		
80.02	Wrought bars, rods, and shapes, of tin-----	8-18	36	4-4	126	6-6	13	5-5	5
80.03	Wrought plates and sheets, of tin-----	8-18	15	3-3	6	6-12	18	5-5	0
80.06	Other articles of tin-----	18-18	788	8-8	168	4-7	2,864		
81.04	Other base metals, unwrought or wrought, and articles-----	5-18	16,588	2-10	31,936	0-18	45,450	5-15	12,146
82.01	Hand tools: i.e., spades, axes, and sickles-----	15-20	1,600	6-6	1,961	4-20	3,289	8-8	32
82.02	Saws-----	8-20	4,419	7-10	14,457	4-15	5,415	8-10	2,431
82.03	Hand tools: i.e., pliers, punches, and pipe cutters-----	15-20	10,672	5-7	9,819	2-21	13,885	8-8	752
82.04	Hand tools: i.e., blowtorches and grinding wheels-----	9-20	14,474	7-7	13,237	2-15	14,975	8-8	1,021
82.05	Interchangeable tools for hand tools-----	5-20	26,718	6-8	38,033	3-21	16,557	8-10	2,393
82.07	Tool tips and plates, rods, and like for tools-----	8-18	1,314	7-7	7,346				
82.08	Coffee mills and grinders, less than 10 kg-----	18-18	1,852	7-7	1,307			8-8	88
82.09	Knives with cutting blades-----	18-25	2,886			8-44	11,473	9-20	116
82.11	Scissors-----	18-18	1,612	5-7	6,005	4-18	7,560		
82.12	Other articles of cutlery-----	20-20	1,591					9-9	247
82.13	Spoons and forks-----	15-18	845			8-20	2,627		
82.14	Locks and padlocks-----	18-25	2,549	9-19	6,880	7-31	7,346	10-20	31
83.01	Base metal fittings for furniture, doors, and chests-----	5-20	8,444	9-9	2,451	7-17	4,758	10-20	497
83.02	Fittings for looseleaf binders, for files-----	5-18	53,294	7-7	11,875	4-20	14,015	10-20	242
83.05	Statuettes of base metal-----	15-18	2,790	8-8	1,581	2-11	2,070		
83.07	Lamps and lighting fittings, of base metal-----	18-20	1,434	9-9	4,148	4-25	629	10-25	67
83.08	Flexible tubing and piping, of base metal-----	15-20	19,008	7-7	8,841	5-20	19,025	10-10	1,278
83.09	Flexible tubing and piping, of base metal-----	18-18	471	7-7	2,479			8-10	145
83.13	Clamps and hooks, of base metal-----	5-20	4,359	7-7	5,082	1-28	1,347	10-20	431
83.14	Stoppers and crown corks, of base metal-----	8-18	1,853	7-11	3,942	6-10	1,303	8-10	483
83.15	Sign plates, of base metal-----	8-20	5,613	8-8	863	10-10	475	10-10	42
84.01	Wire, rods, tubes, and plates, of base metal, for soldering-----	5-18	4,469	8-10	5,622	1-5	2,475	8-10	548
84.02	Steam and other vapor generating boilers-----	5-18	5,471	6-6	5,300	7-7	1,953		
84.04	Steam engines with self-contained boilers-----	15-15	367			4-5	137		
84.05	Steam and other vapor power units-----	15-15	16,755	5-5	13,195	4-8	7,122		
84.06	Internal combustion piston engine-----	8-18	492,352	4-14	163,521	4-5	143,200	8-30	15,874
84.07	Hydraulic engines and motors-----	15-18	812	6-6	4,467	8-18	4,624	8-15	728
84.08	Other engines and motors-----	5-18	86,769	5-8	148,414	5-10	84,009		
84.09	Mechanically propelled road rollers-----	8-15	1,267	5-5	754	5-5	0		
84.10	Pumps for liquids-----	10-18	35,720	6-9	63,987	3-6	17,767	8-15	20,188
84.11	Air pumps and vacuum pumps-----	10-20	45,962	4-9	69,134	5-7	24,605	8-15	12,989
84.12	Air conditioning machines-----	15-20	19,192	8-8	10,877	6-6	3,600		
84.13	Furnace burners for liquid fuel-----	15-20	3,615	6-6	9,495	5-5	186	8-8	2,960
84.14	Industrial and laboratory furnaces and ovens, electric-----	15-18	2,094	6-6	3,815			8-8	1,115
84.15	Refrigerators-----	15-20	33,541	5-5	37,341	5-5	21,133	8-15	8,813
84.17	Machinery for treatment of materials by heating-----	8-20	26,931	5-9	49,955	6-10	28,833	8-8	15,105
84.18	Centrifuges; filtering machinery-----	10-18	12,345	5-8	34,570	2-6	7,057	8-8	9,404
84.19	Machinery for cleaning or drying bottles; filling bottles-----	8-20	36,420	5-7	31,191	2-8	15,517	8-8	8,323
84.20	Weighing machinery-----	10-18	6,375	6-6	4,484	5-13	2,180	8-8	529
84.21	Mechanical appliances for projecting liquids or powders-----	15-18	14,146	6-6	17,150	5-10	3,686	8-8	4,437
84.22	Lifting and handling machinery-----	10-18	157,273	4-9	86,204	5-5	37,005	8-8	18,027
84.23	Excavating, leveling, boring, and extracting machinery-----	10-18	194,510	4-11	102,332	5-5	20,760	5-8	9,839
84.24	Agricultural and horticultural machinery for soil preparation-----	15-15	29,732	5-5	8,189	0-0	37,063		
84.25	Harvesting and threshing machinery-----	10-18	77,109	5-5	36,217			8-8	3,534
84.26	Dairy machinery-----	8-18	9,888	6-6	5,540	6-6	2,434	8-8	364
84.28	Other agricultural machinery-----	15-18	25,755	5-5	6,207	0-0	34,883	8-8	953
84.29	Machinery of kind used in bread grain milling industry-----	15-15	2,216			2-6	2,619		

See footnote at end of table.

APPENDIX TABLE 4-F--Continued

Industria, sector 27H headings where possible rate disparities may exist in the Canadian tariff compared with tariffs of the United States, Japan and the European Community 1/

CN number	Abbreviated 27H description	Canada		European Community		United States		Japan	
		Tariff range	HSN imports	Tariff range	HSN imports	Tariff range	HSN imports	Tariff range	HSN imports
		Percent ad val.	1,000 dollars	Percent ad val.	1,000 dollars	Percent ad val.	1,000 dollars	Percent ad val.	1,000 dollars
34.30	Machinery for food and drink industries; n.s.p.f.	10-18	13,960	5-5	10,397	6-6	11,417	3-8	4,755
34.31	Machinery for making or finishing cellulose pulp	15-18	14,005	5-6	15,913	4-7	27,298	8-8	2,651
34.32	Bookbinding machinery	10-15	3,585	5-5	6,352	5-5	4,273	10-15	1,968
34.33	Paper or paperboard cutting machines	5-18	20,632	5-5	13,134	5-5	14,105	8-8	3,660
34.34	Machinery for type founding or typesetting	10-36	15,636	3-7	16,539	1-20	7,837	3-8	757
34.35	Other printing machinery	10-18	25,371	4-7	29,952	6-13	36,623	6-15	18,619
34.36	Machines for extruding manmade textiles	15-15	13,954	5-5	30,480	4-7	28,622	10-15	1,968
34.37	Weaving machines	15-15	14,336	4-6	60,994	5-8	59,157	10-15	1,968
34.38	Auxiliary machinery for use with weaving machines	10-20	763	5-5	33,636	5-21	34,570	8-10	7,697
34.40	Machinery for washing, bleaching, etc., textile yarns	15-20	48,870	5-8	23,815	5-20	14,482	8-8	9,617
34.41	Sewing machines	15-20	15,038	6-12	31,873	4-12	82,326	5-13	3,206
34.42	Machinery for preparing and tanning, skins or leather	5-15	3,392	10-15	1,000	5-5	6,987	10-15	1,968
34.43	Converters, ladles, ingot molds, and casting machines	15-18	17,824	5-5	4,934	5-5	5,407	8-8	1,341
34.44	Rolling mills and rolls thereof	15-18	11,170	6-7	9,003	8-8	10,487	8-8	4,016
34.45	Machine tools for metal working	15-18	112,236	3-11	139,820	5-10	175,521	8-15	50,905
34.46	Machine tools for working stone	15-15	357	5-5	2,524	5-5	1,559	10-15	1,968
34.47	Machine tools for working wood	13-18	19,114	10-15	1,000	5-6	8,920	8-8	2,388
34.48	Accessories and parts for machine tools	15-18	8,174	4-4	28,710	5-10	33,118	8-8	3,403
34.49	Tools for working in the hand	13-18	30,089	7-7	10,540	5-8	10,220	8-8	8,353
34.50	Gas-operated welding and cutting appliances	10-18	2,970	5-5	1,758	5-10	2,358	8-15	1,968
34.51	Typewriters	8-20	6,699	5-7	12,707	4-6	60,167	8-25	7,991
34.52	Calculating machines	8-20	43,548	6-14	59,264	5-6	95,067	8-25	47,301
34.53	Statistical machines operated with punched cards	10-18	144,661	7-7	186,678	5-6	5,943	5-25	27,036
34.54	Other office machines	5-18	15,255	6-7	34,506	4-6	17,333	8-25	44,424
34.55	Parts and accessories for office machines	8-18	16,159	4-11	97,973	6-13	41,824	5-15	33,409
34.56	Machinery for sorting, crushing, etc., mixed earth and stone	8-18	25,986	5-5	14,199	5-5	9,020	8-8	2,013
34.57	Glassworking machines	10-18	1,000	10-15	1,000	10-15	1,000	10-15	1,000
34.58	Automatic vending machines	10-18	1,000	10-15	1,000	10-15	1,000	10-15	1,000
34.59	Machinery, n.s.p.f.	5-20	80,655	5-10	101,447	5-10	99,273	5-15	27,516
34.60	Molding boxes for metal foundry; molds	8-18	11,461	5-5	7,636	6-10	18,198	8-8	1,843
34.61	Taps, cocks, and valves, for pipes, boiler shells, and tanks	10-18	35,250	6-7	88,204	5-11	20,342	8-20	17,526
34.62	Ball, roller or needle roller bearings	8-18	50,430	7-7	73,781	4-23	7,390	8-8	11,444
34.63	Transmission shafts, cranks, gears, and clutches	8-18	49,919	6-6	4,824	5-10	86	8-8	3,351
34.64	Gaskets	13-18	6,615	5-6	14,374	2-10	2,082	8-8	3,351
34.65	Machinery parts, n.s.p.f.	18-18	1,536	5-6	14,374	2-10	2,082	8-8	3,351
35.01	Electrical goods: i.e., generators, motors, and transformers	8-20	82,466	5-9	83,004	5-25	77,203	8-15	17,716
35.03	Primary cells and primary batteries	18-18	2,300	10-15	1,000	10-15	1,000	10-15	1,000
35.04	Electrical storage batteries	10-18	12,394	4-10	7,690	8-9	7,184	10-15	1,000
35.05	Tools for working in the hand, with self-contained electric motor	15-18	5,268	7-7	18,797	6-7	3,560	3-8	1,637
35.06	Stromechanical domestic appliances	15-20	26,253	8-8	14,823	6-9	11,803	8-8	863
35.07	Motors, with self-contained electric motor	18-18	3,840	6-7	3,665	7-10	16,509	8-8	1,708
35.08	Electrical starting and ignition equipment for combustion engines	10-18	60,671	7-11	14,263	4-4	13,381	8-10	1,358
35.09	Electrical lighting and signaling equipment, for motor vehicles	13-20	22,774	7-9	6,304	4-19	6,478	8-15	499
35.10	Portable electrical battery and magneto lamps	20-20	1,671	8-13	3,453	10-10	1,000	10-10	1,000
35.11	Industrial and laboratory electric furnaces and ovens	8-20	16,484	6-8	22,202	4-5	9,852	8-15	6,462
35.12	Electric instantaneous water heaters and immersion heaters	15-20	20,091	7-12	15,636	4-17	14,311	10-10	1,712
35.13	Wire telephonic and telegraphic apparatus	8-18	31,069	7-8	21,763	7-9	30,631	8-15	3,421
35.14	Microphones, loudspeakers, and amplifiers	8-18	13,405	7-7	14,069	8-8	23,018	8-8	1,245
35.15	TV and radiotelegraphic transmission apparatus	8-18	153,194	7-17	104,388	5-10	467,435	8-20	24,820
35.16	Electric traffic control equipment	10-18	8,410	6-6	1,565	4-19	190	8-8	14
35.17	Electric sound or visual signaling apparatus	5-18	4,311	6-6	6,452	4-6	3,419	8-8	1,005
35.18	Electrical capacitors	13-18	10,969	7-7	16,122	10-10	1,000	10-10	1,000
35.19	Resistors and electric-circuit apparatus	8-20	73,202	6-8	147,459	4-9	54,953	8-8	24,770

29.09	Epoxides, epoxyalcohols, and epoxyetthers-----	5-24	903			8-15	646	10-10	2,169
29.10	Acetals and hemiacetals-----	9-20	21	7-9	378	8-14	100	10-13	13
29.11	Aldehydes and cyclic polymers of aldehydes-----	4-29	4,882	7-12	9,833	8-15	813	8-13	1,743
29.12	Derivatives of aldehyde-function compounds-----	5-20	0	8-8	11			10-10	16
29.13	Ketones-function and quinone-function compounds-----	1-20	9,680	6-12	8,692	5-12	1,658	5-20	4,301
29.14	Monocarboxylic acids-----	4-23	19,951	5-12	20,894	8-15	9,505	5-20	4,616
29.15	Polycarboxylic acids-----	4-23	3,985	6-10	12,500	4-15	13,420	8-10	18,370
29.16	Alcohol-acids, keton-acids, phenol-acids, and derivatives-----	2-26	5,375	4-12	7,146	8-13	4,720	10-30	3,780
29.17	Sulphuric esters and their salts-----	5-20	194	9-9	442			10-10	99
29.18	Nitrous and nitric esters-----	5-20	0	6-9	55	8-15	38	10-10	10
29.19	Phosphoric esters and their salts-----	5-23	47	7-9	3,806			10-10	605
29.20	Carbonic esters and their salts-----	5-20	1	9-9	316	1-1	28	10-10	58
29.21	Other esters of mineral acids and their salts-----	5-20	0	9-9	3,997	10-10	181	10-10	1,404
29.22	Amine-function compounds-----	5-30	7,762	4-8	16,307	11-15	5,950	10-20	5,876
29.23	Oxygen-function amino-compounds-----	5-30	12,937	7-19	15,660	15-15	3,609	10-25	6,529
29.24	Quaternary ammonium salts-----	5-20	8	6-9	2,224	5-15	224	10-10	525
29.25	Amide-function compounds-----	5-30	13,551	6-11	13,428	13-15	1,578	8-20	6,769
29.26	Imide-function compounds-----	5-20	1,335	6-9	2,661	9-15	714	5-13	1,564
29.27	Nitrile-function compounds-----	5-20	8,897					10-20	1,017
29.28	Diazo-, azo-, and azoxy-compounds-----	9-30	1,646	8-8	1,426	9-9	129	10-10	280
29.29	Organic derivatives of hydrazine-----	5-20	404	9-9	2,918			10-10	111
29.30	Compounds with other nitrogen-functions-----	9-20	0	9-9	5,169	10-15	2,663	10-10	1,297
29.31	Organo-sulphur compounds-----	4-20	8,736	7-9	5,621			10-13	4,021
29.32	Organo-arsenic compounds-----	5-20	0	9-9	47			10-10	70
29.33	Organo-mercury compounds-----	5-20	0	9-9	272				
29.34	Other organo-inorganic compounds-----	5-20	1,627	9-10	1,728	7-18	1,466	10-10	3,069
29.35	Heterocyclic compounds-----	5-30	30,172	5-13	94,739	5-15	14,571	3-20	31,213
29.36	Sulphonamides-----	15-30	2,275	7-7	8,182	13-15	2,322	10-10	3,120
29.37	Sulfones and sulfams-----	5-20	0	9-9	460			10-10	76
29.38	Vitamins-----	2-19	9,911	4-9	22,049			8-15	6,988
29.39	Hormones-----	2-19	30,525	6-9	21,471				
29.41	Glycosides and their salts and esters-----	5-19	4	6-9	6,276				
29.42	Vegetable alkaloids and their salts-----	2-29	9,416	5-9	22,872	13-15	1,405	5-20	2,020
29.43	Sugars and sugar esters-----	10-40	236	15-20	944	15-15	81	10-25	138
29.44	Antibiotics-----	2-19	11,550	5-11	47,359			8-10	14,531
29.45	Other organic compounds-----	5-20	160	7-10	503	8-13	46	10-10	27
30.01	Medicaments-----	0-26	11,952	6-17	84,066	13-80	15,565	8-25	62,087
30.04	Wadding and gauze for medical use-----	4-22	475	7-7	1,897	10-23	3,119	10-10	1,153
30.05	Other pharmaceutical goods-----	3-20	310	8-8	2,127	8-18	4,846	10-10	1,607
32.02	Tannins and their salts and esters-----	3-19	497	5-5	164			5-8	25
32.03	Synthetic tanning substances-----	5-17	81	5-5	631			3-16	1,196
32.04	Coloring matter of vegetable origin-----	3-30	549	2-5	736	15-15	287	3-3	402
32.05	Synthetic organic dyestuffs-----	4-30	26,434	8-14	57,345	5-15	24,802	8-13	26,620
32.06	Color lakes-----	30-30	0	11-11	518	15-15	320	8-13	142
32.07	Other coloring matter-----	1-16	3,132	5-9	12,456	5-15	7,399	5-13	767
32.08	Coloring substances for ceramics and glass-----	4-34	154	3-8	2,905	15-15	940	5-8	1,256
32.09	Varnishes and lacquers; paints-----	4-30	1,656	7-8	19,611	10-18	11,724	4-13	10,471

See footnote at end of table.

APPENDIX TABLE 4-G--Continued

Industrial sector BTN headings where possible rate disparities may exist in the United States tariff compared with tariffs of Canada, Japan, and the European Community 1/

BTN number	Abbreviated BTN description	United States		Canada		Japan		European Community	
		Tariff range	MFN imports 1,000 ad val.	Tariff range	MFN imports 1,000 ad val.	Tariff range	MFN imports 1,000 ad val.	Tariff range	MFN imports 1,000 ad val.
32.10	Artists' colors, in containers-----	8-19	1,282	9-9	439				
33.01	Essential oils-----	0-13	30,344	2-12	27,485				
33.02	Terpene by-products of essential oils-----	12-12	0			0-0	0		
33.04	Mixtures of odoriferous substances-----	4-18	13,502	5-5	19,706	8-8	2,466	8-25	2,406
33.06	Perfumery-----	4-20	12,433	7-8	12,919				
34.03	Lubricating preparations-----	5-16	229	4-4	4,888	0-0	0		
34.04	Artificial waxes-----	5-20	0	5-5	3,661	10-15	1,328	8-10	2,326
34.05	Polishes and creams-----	3-16	578	6-7	3,023			5-10	1,025
34.07	Modeling pastes-----	5-18	0	7-7	231				
35.02	Albumins and their derivatives-----	3-37	519	10-12	3,921	10-10	123	8-20	210
35.06	Prepared glues, n.s.p.f.-----	3-16	0	6-10	1,322			3-10	318
36.01	Propellant powders-----	15-15	783	4-6	634				
36.02	Prepared explosives-----	1-20	10,793	8-8	1,412			10-10	1
36.07	Pyrotechnic articles-----	1-26	3,920	7-7	1,540			8-8	298
36.08	Pyro-cerium-----	16-16	35	6-6	216	0-0	0		
36.09	Other combustible preparations-----	5-18	0					8-8	451
37.06	Chemical products for photography-----	2-18	178	6-6	4,647				
38.02	Animal black-----	5-10	245			0-0	462		
38.08	Bleach and resin acids-----	4-16	116	3-5	26,212		3,874	5-10	9,558
38.11	Disinfectants and insecticides-----	2-16	643	4-6	26,161				
38.13	Pickling preparations for metal surfaces-----	5-16	0	4-7	2,454				
38.14	Antiknock preparations-----	5-16	301	5-11	23,421				
38.18	Composite solvents and thinners-----	4-16	75			6-15	618		
38.19	Chemical products and preparations of chemical industries, n.s.p.f.-----	1-26	1,900	2-9	81,845	1-18	78,452	5-13	33,061
39.01	Condensation, polycondensation products-----	3-23	8,623	7-14	71,798	8-28	46,026	5-15	20,809
39.02	Polymerization and copolymerization products-----	3-21	39,724	7-12	86,091	8-23	86,987	8-18	17,076
39.03	Regenerated cellulose-----	3-19	6,668	6-12	29,618			5-14	2,675
39.06	Other high polymers and artificial plastic materials-----	4-30	413	5-10	5,442	10-15	591	8-10	1,758
39.07	Articles of cellulose, hardened proteins, etc-----	4-35	57,081	7-12	37,436	8-25	54,071	10-15	3,920
40.02	Synthetic rubber latex-----	3-16	20,799	4-5	87,001	3-18	31,190		
40.06	Unvulcanized rubber in shapes-----	3-13	145					3-8	509
40.08	Plates and sheets of unhardened vulcanized rubber-----	6-38	209	6-9	5,249	15-23	9,386	8-10	191
40.10	Transmission belts-----	6-21	2,381	10-10	7,355	10-20	6,329	8-8	520
40.13	Wearing apparel of unhardened vulcanized rubber-----	5-35	3,072	8-10	3,425			8-8	78
41.01	Raw hides and skins-----	2-41	63,530	0-0	238,571	0-0	14,667	0-0	73,966
42.02	Travel goods of leather-----	4-21	72,569	8-21	10,747			10-20	3,165
42.03	Wearing apparel of leather-----	4-27	40,284	8-13	6,349	10-25	7,437	10-20	615
42.06	Articles made from gut-----	17-17	1,145	6-6	2,132	0-0	115		
43.01	Raw furskins-----	19-41	84,565	0-0	126,143	0-0	20,512	5-20	7,367
43.02	Furskins, tanned and dressed-----	3-19	7,519	5-5	22,951	8-23	7,854		
43.03	Articles of furskin-----	9-19	3,028	7-10	5,741				
43.04	Artificial fur and articles-----	6-32	0	9-9	84	0-0	0		
44.15	Plywood-----	8-20	119,007			10-15	28,420		
44.17	"Improved" wood, in sheets-----	10-13	282			0-0	0		
44.23	Builders' carpentry and joinery-----	5-20	5,919	6-7	9,100	8-18	5,113	8-8	180
44.24	Household utensils of wood-----	7-26	15,349	8-8	2,928			10-10	8
44.25	Wooden tools, tool bodies, and tool handles-----	4-22	4,568	6-7	373	10-15	1,169	5-8	6
44.27	Lamps and furniture of wood-----	5-17	16,324	7-7	5,927				
44.28	Other articles of wood-----	3-20	42,112	4-7	4,320			10-15	129
45.01	Natural cork, unworked-----	4-12	3,991			0-0	28	0-0	3,462
45.02	Natural cork in blocks-----	14-14	53			0-0	0		
45.03	Articles of natural cork-----	5-20	1,964			0-0	862	10-10	538
45.04	Agglomerated cork and articles-----	5-20	2,207			0-0	823	10-13	461
46.01	Plaits and similar products of plaiting materials-----	2-21	3,306	5-7	510	0-0	0		
46.02	Plaiting materials bound together-----	3-29	2,025	5-10	3,195	10-20	200	8-15	1,044
46.03	Basketwork-----	4-25	13,170	10-10	11,621				
48.01	Paper and paperboard in rolls-----	1-34	910,663	3-12	423,381	3-18	42,225	6-20	10,210
48.05	Paper and paperboard corrugated in rolls-----	3-25	1,099					8-8	82
48.07	Paper and paperboard impregnated and printed-----	1-25	5,009	10-12	50,316	5-20	17,440	5-15	4,059
50.03	Silk waste-----	7-10	135	0-0	5,874	0-0	0	0-0	4,694
50.04	Silk yarn, not for retail sale-----	10-14	989			2-5	7		
50.05	Yarn spun from silk waste, not for sale-----	9-14	1,613	4-4	2,688	0-0	0		
50.06	Yarn spun from noil silk, not for retail sale-----	9-14	123	3-3	28	0-0	0		
50.08	Silkworm gut-----	14-14	0	4-4	23	0-0	0		
50.09	Woven fabrics of silk other than noil-----	11-19	26,943	8-14	11,825				
50.10	Woven fabrics of noil silk-----	11-18	137			0-0	0		
51.01	Yarn of manmade fibers, not for sale-----	11-64	28,048	3-11	58,128	18-22	30,358	8-25	2,394
51.02	Monofil of manmade fiber-----	1-83	1,678	5-11	4,201	0-0	0	8-15	690
51.03	Yarn of manmade fibers, for sale-----	22-27	193	9-10	258	0-0	0	8-13	4
51.04	Woven fabrics of manmade fibers-----	13-38	60,217	13-15	22,125	5-32	31,126	8-25	3,734
52.02	Woven fabrics of metal thread-----	8-21	837	9-9	91	0-0	0	10-10	5
53.01	Sheep's or lambs' wool, not carded-----	10-43	129,524	0-0	472,056	0-0	8,554	0-0	362,066
53.02	Other animal hair, not carded-----	0-20	8,808	2-2	19,627	0-0	671	0-0	2,549
53.03	Waste of sheep's or lambs' wool, not pulled-----	10-18	21,592	0-0	7,285	0-0	718	0-0	1,999
53.04	Waste of animal hair, pulled-----	15-15	84	0-0	342	5-5	104	0-0	4
53.05	Waste of animal hair, carded or combed-----	5-30	6,731	3-3	31,622	10-10	5,037	5-5	5,210
53.06	Yarn of carded sheep's or lambs' wool, not for sale-----	16-30	1,946	5-8	956	8-16	236	5-5	72
53.07	Yarn of combed sheep's or lambs' wool-----	16-30	11,507	5-10	8,476	8-16	1,010	5-5	942
53.08	Yarn of fine animal hair, not for sale-----	5-30	2,806	4-4	4,293	8-16	398	5-5	153
53.10	Yarn of animal hair, for retail sale-----	5-30	4,071	11-11	3,550			8-8	419
53.11	Woven fabrics of sheep's or lambs' wool or of fine animal hair-----	16-100	88,807	13-18	45,288	10-36	19,120	10-16	21,632
54.01	Flax, raw or processed but not spun-----	0-13	3,456	0-0	2,689	0-0	0		
54.02	Ramie-----	4-13	54	0-0	306	0-0	0		
54.03	Flax or ramie, not for sale-----	4-18	2,684	2-9	2,756	0-0	280		

See footnote at end of table.

APPENDIX TABLE 4-G--Continued

Industrial sector HTS headings where possible rate disparities may exist in the United States tariff compared with tariffs of Canada, Japan, and the European Community 1/

HTS number	Abbreviated HTS description	United States		Canada		Japan		European Community	
		Tariff range	MFN imports	Tariff range	MFN imports	Tariff range	MFN imports	Tariff range	MFN imports
		Percent ad val.	1,000 dollars	Percent ad val.	1,000 dollars	Percent ad val.	1,000 dollars	Percent ad val.	1,000 dollars
54.05	Woven fabrics of flax or of ramie-----	3-68	25,670	16-16	3,098	20-20	358	25-30	337
55.05	Cotton yarn, not for retail sale-----	4-20	18,716	4-8	12,701	10-18	10,812	6-11	7,607
55.07	Cotton guaze-----	7-36	0	9-9	740	18-20	4,169	7-14	11

59.03	Bonded fiber fabrics-----	14-22	801					10-14	488
59.04	Twine, and cordage-----	3-28	39,582	13-13	3,578	10-20	6,532	5-10	246
59.05	Nets and netting of twine and cordage-----	4-53	1,102	10-14	384	23-23	3,317	5-10	165
59.06	Other articles made from yarn-----	7-25	0	9-9	309	0-0	0	7-10	103
59.07	Textile fabrics coated with gum-----	6-26	360	11-11	750			7-11	8
59.08	Textile fabrics impregnated with preparations-----	6-32	886	14-14	9,232			8-8	339
59.11	Rubberized textile fabrics-----	6-38	1,129	7-14	6,951	13-32	2,861	8-8	134
59.12	Textile fabrics otherwise impregnated-----	7-19	34	7-7	1,548			8-10	92
59.13	Elastic fabrics and trimmings-----	15-21	3,162					8-11	62
59.14	Wicks, of woven and plaited textile materials-----	10-14	280			0-0	51		
59.16	Transmission belting of textile material-----	6-21	1,689	8-8	1,074			8-11	66
59.17	Textile fabrics for machines-----	6-38	4,390	4-10	9,812	5-25	1,440	8-11	1,233
60.01	Knitted or crocheted fabrics-----	6-40	13,388	13-14	15,879	20-28	14,915	8-25	4,107
60.02	Gloves, not elastic or rubberized-----	10-64	8,839	20-20	3,645	25-25	4,615	10-14	186
60.03	Stockings, knitted or crocheted-----	10-50	3,650	13-13	7,596	22-28	2,439	10-15	477
60.04	Under garments, knitted or crocheted-----	10-45	20,600	17-17	18,908			14-21	510
60.05	Outer garments, knitted or crocheted-----	6-43	228,037	11-18	53,139			18-21	5,536
60.06	Knitted or crocheted fabric, elastic or rubberized-----								
61.01	Men's and boys' outer garments-----	6-40	900	11-16	2,447	20-28	1,247	10-14	12
61.02	Women's, girls', and infants' outer garments-----	8-43	119,719	17-17	57,967	10-25	27,685	18-28	941
61.03	Men's and boys' under garments-----	8-43	113,833	11-17	50,120	15-25	22,898	18-28	1,148
61.04	Women's, girls', and infants' under garments-----	3-43	30,857	17-17	28,703			14-14	86
61.05	Handkerchiefs-----	8-43	5,629	13-13	4,652			14-21	76
61.06	Shawls and scarves-----	3-55	10,000	11-14	6,019	20-25	2,550	10-30	546
61.08	Accessories for women's and girls' garments-----	8-31	15,383					13-21	414
61.09	Corsets-----	8-35	608	11-11	212	0-0	0	14-21	3
61.10	Gloves, not knitted or crocheted-----	7-32	6,474	9-9	8,613			14-21	265
61.11	Made up accessories for apparel-----	10-64	2,233	15-15	1,024	0-0	0	14-14	13
62.01	Travelling rugs and blankets-----	6-38	667	11-11	518	15-25	1,148	14-25	439
62.02	Bed linen and table linen-----	9-43	1,278	12-14	1,491			10-14	758
62.03	Sacks and bags for pecking goods-----	4-43	37,601	17-19	16,301	20-25	21,472	10-21	772
62.04	Tarpaulins, sails, and tents-----	4-40	1,115	8-20	20,173	13-25	182	8-20	144
62.05	Other made up textile articles-----	6-25	0					8-11	9
63.01	Clothing and linen, of textile materials showing wear-----	6-40	8,349	8-15	2,921	15-33	9,134	10-14	398
63.02	Used or new rags and cordage-----	2-11	381			0-0	0		
64.01	Footwear with outer soles and uppers of rubber-----	2-11	7,643	0-0	26,562				
64.02	Footwear with outer soles of leather-----	6-38	55,613					10-10	3
64.03	Footwear with outer soles of wood-----	3-20	199,793					10-30	2,065
65.01	Hat-forms-----	8-13	309			0-0	0		
65.02	Hat-shapes-----	8-65	1,256	8-8	1,008	20-20	349	13-13	49
65.03	Felt hats-----	6-29	2,910	5-7	727	8-25	336		
65.04	Hats and other headgear, any material-----	8-65	1,735	8-11	1,403	20-20	97	13-20	32
65.05	Hats and other headgear, knitted or crocheted-----	5-29	1,340	6-9	606	0-0	0	13-20	27
65.07	Head-bands and hat foundations-----	5-43	8,974	10-10	1,809	20-28	1,936	13-13	152
66.01	Umbrellas-----	2-25	0	5-8	331			10-10	7
66.03	Parts of umbrellas or walking-sticks-----	20-20	11,401					10-10	19
67.02	Artificial flowers and articles thereof-----	12-30	1,745	7-15	339	0-0	1,255	10-20	25
67.03	Human hair, worked-----	21-43	42,613	13-17	1,760	18-20	2,628	10-20	1,468
67.04	Wigs-----	4-11	3,614			0-0	0		
68.02	Worked monumental or building stone-----	7-25	74,853	8-8	3,874	8-25	4,241	10-10	526
68.04	Millstones and grindstones-----	1-14	18,771	4-9	4,507			3-8	279
68.11	Articles of cement-----	3-20	1,803	3-5	10,280	10-18	3,222	5-10	983
68.12	Articles of asbestos-cement-----	6-21	992	4-4	1,710			8-8	13
68.13	Fabricated asbestos and articles thereof-----	1-14	4,052	4-7	7,509				
68.15	Worked mica and articles-----	4-13	3,119			3-32	2,503		
69.05	Roofing tiles-----	9-20	1,179	5-8	1,264			3-3	14
69.07	Unglazed sets, paving, and wall tiles-----	6-14	113	4-5	747				
69.08	Glazed sets, paving, and wall tiles-----	24-25	3,598	8-8	1,944			5-5	7
69.09	Laboratory, chemical, and industrial wares-----	23-25	19,401	9-9	10,382			5-5	16
69.11	Tableware, of porcelain or china-----	7-30	957	8-12	1,817	10-10	288	8-8	552
69.12	Tableware, of other kinds of pottery-----	13-60	35,179	24-26	10,921	10-20	4,130	8-8	66
		3-60	23,097	8-16	7,011	20-20	2,673	8-8	172

See footnote at end of table.

APPENDIX TABLE 4-G--Continued

Industrial sector HTS headings where possible rate disparities may exist in the United States tariff compared with tariffs of Canada, Japan, and the European Community 1/

HTS number	Abbreviated HTS description	United States		Canada		Japan		European Community	
		Tariff	MFN	Tariff	MFN	Tariff	MFN	Tariff	MFN
		range	range	range	range	range	range	range	range
		Percent	1,000	Percent	1,000	Percent	1,000	Percent	1,000
		ad val.	dollars	ad val.	dollars	ad val.	dollars	ad val.	dollars
69.13	Statuettes, of pottery and china-----	3-23	24,351	8-28	4,187			8-8	282
69.14	Other articles, of pottery and china-----	20-23	141	8-15	571			8-8	26
70.01	Waste glass-----	2-11	720			0-0	0		
70.02	"Enamel" glass-----	34-34	6	4-4	5	0-0	0	5-5	0
70.03	Glass in balls, rods, and tubes, unworked-----	7-18	3,374	7-7	2,147	5-18	1,782	5-10	961
70.05	Unworked drawn or blown glass-----	3-26	30,150	8-8	4,304	8-8	8,683	5-10	502
70.07	Cast, rolled, drawn, or blown glass, cut-----	8-22	2,770	8-8	863	8-18	2,968		
70.11	Glass envelopes-----	5-16	340			5-5	8,352		
70.12	Glass liners for vacuum bottles-----	20-29	20	11-13	350	5-5	98	8-8	5
70.13	Glassware-----	11-30	22,591	16-16	13,780	15-20	15,963	10-15	1,581
70.15	Clock and watch glasses-----	8-24	238	8-8	173			8-10	59
70.17	Laboratory, hygienic and pharmaceutical glassware-----	6-21	1,528	7-9	2,825	10-20	7,323	8-10	295
70.18	Optical glass-----	10-25	1,148	9-9	1,469			8-10	785
70.19	Glass beads and imitation pearls-----	4-50	12,983	5-12	6,336	10-18	119	8-10	767
70.20	Glass fiber, yarns, and fabrics-----	3-28	1,033	11-13	7,559			10-13	3,906
70.21	Other articles of glass-----	7-20	916	9-9	3,465			8-20	506
71.02	Precious and semiprecious stones, unworked-----	3-21	448,730	4-4	360,327	0-0	25,051	3-8	76,799
71.03	Synthetic precious or semiprecious stones, unworked-----	4-15	1,636	1-4	5,498	0-0	2	3-20	1,493
71.04	Dust and powder of precious or semiprecious stones-----	2-21	18,665	0-0	9,302	0-0	1,055	0-0	7,577
71.05	Silver, unwrought or semimanufactured-----	1-25	164	2-7	124,293			3-10	12,977
71.07	Gold, unwrought or semimanufactured-----	5-20	134	1-8	0	0-0	0	0-0	0
71.08	Bolled gold, unwrought or semimanufactured-----	12-20	9	4-4	0	0-0	0	0-0	0
71.09	Platinum, unwrought or semimanufactured-----	5-25	74,533	1-5	66,166	0-0	8,513	5-8	53,994
71.10	Bolled platinum, unwrought or semimanufactured-----	12-20	9	4-4	150			10-10	4
71.12	Articles of jewelry of precious metal-----	8-28	12,690	5-9	4,111	13-25	2,436		
71.13	Articles of goldsmiths' or silversmiths' wares, of precious metal-----	9-20	2,002	5-8	1,132				
71.14	Other articles of precious metal-----	11-20	0	6-8	130	0-0	1,964	5-25	109
71.15	Articles consisting of pearls or stones-----	8-28	1,407	7-8	4,511	0-0	0	5-20	90
71.16	Imitation jewelry-----	8-35	20,268	12-18	6,462	13-25	6,912	13-20	1,598
73.06	Puddled bars and pigments, ingots-----	3-10	192			0-0	1,422		
73.08	Iron and steel coils-----	8-12	55,385			0-0	0		
73.09	Universal plates of iron and steel-----	7-12	17,760			0-0	5		
73.19	High-pressure hydro-electric conduits of steel-----	5-12	0			0-0	0		
73.33	Needles for hand sewing, of iron or steel-----	10-19	2,969	6-8	327			5-5	9
73.34	Pins, of iron or steel-----	8-23	2,517	8-8	785	5-20	381	5-5	36
73.40	Other articles of iron or steel-----	0-22	35,313	6-8	24,365	5-28	56,530	8-10	2,888
74.02	Master alloys-----	2-11	66	0-0	1,492				
74.03	Wrought bars, rods, shaped, of copper-----	2-16	23,024			5-18	6,778		
74.04	Wrought plates and sheets, of copper-----	2-16	34,787			5-18	6,850		
74.06	Copper powders and flakes-----	5-10	2,682			0-0	921		
74.17	Gauge, grill, and setting, of copper wire-----	6-25	1,183	8-8	1,109			8-10	190
74.18	Expanded metal, of copper-----	10-10	0			0-0	0		
74.19	Cooking and heating apparatus, of copper-----	6-10	40			0-0	0		
74.20	Other articles for home, of copper-----	5-20	13,215	7-7	1,351			10-25	127
74.21	Other articles of copper-----	7-22	4,130	7-7	3,335	5-18	7,235	8-25	740
75.02	Wrought bars, rods, and shapes, of nickel-----	2-16	1,437	6-6	8,105				
75.03	Wrought plates and sheets, of nickel-----	2-16	7,910	1-7	8,927				
75.04	Other articles of nickel-----	1-25	4,329	5-7	734			10-25	397
76.06	Aluminum foil-----	2-20	4,979			6-18	1,636		
76.15	Articles for home, of aluminum-----	5-26	5,672	8-8	1,976			10-10	94
76.16	Other articles of aluminum-----	1-25	5,405	8-10	10,064			10-10	1,115
77.01	Unwrought magnesium-----	7-20	5,606	5-8	19,278			5-15	481
78.03	Wrought plates and sheets, of lead-----	6-12	315			5-5	1,355		
78.04	Lead foil-----	3-15	278	3-10	510	0-0	0		
79.01	Unwrought zinc-----	5-19	57,769	5-5	36,530	0-0	164	3-8	4,134
80.04	Cutters, of zinc-----	10-10	0			0-0	0		
81.01	Tin foil-----	5-18	15	4-6	124	0-0	132	8-8	35
81.02	Tungsten-----	7-16	580	6-10	3,681	0-0	1,808	5-10	398
81.03	Molybdenum-----	5-13	485			0-0	0		
81.04	Other base metals-----	0-18	45,450	2-10	31,936	5-18	16,588	5-15	12,146
82.01	Hand tools: i.e., spades, axes, and scythes-----	4-20	3,289	6-6	1,961			8-8	32
82.03	Hand tools: i.e., pickers and punches-----	2-21	13,885	5-7	9,819			8-8	752
82.05	Interchangeable tools for hand tools-----	3-21	16,557	6-8	38,033	5-20	26,718	8-10	2,393
82.09	Knives-----	8-44	11,473	17-17	3,268	18-25	2,886	9-20	116
82.10	Knife blades-----	11-44	966	13-13	260	8-18	691	9-9	3
82.11	Razors-----	4-18	7,560	5-7	6,005				
82.12	Scissors-----	37-50	5,653	11-11	248	20-20	1,591	9-9	247
82.13	Other articles of cutlery-----	8-20	2,627	9-9	1,530			9-20	305
82.14	Spoons, forks, and knives-----	7-31	7,346	9-19	6,880			10-20	31
82.15	Handles of base metal-----	10-44	4	8-8	6	0-0	39	10-20	0
83.01	Locks and padlocks-----	7-17	4,758			5-20	8,444		
83.02	Base metal fittings for furniture-----	4-20	14,015	7-7	11,275	5-20	53,294	10-20	242
83.04	Files and racks, of base metal-----	10-10	58			0-0	0		
83.06	Statuettes, of base metal-----	4-25	629	9-9	4,148			10-25	67
83.07	Lamps of base metal-----	5-20	19,025	7-7	8,841			10-10	1,278
83.09	Clasps-----	1-28	1,347	7-7	5,082	5-20	4,359	10-20	431
83.11	Bells and gongs, of base metal-----	9-20	1,019	9-9	318			10-10	16
83.12	Photograph frames, of base metal-----	9-20	123	10-10	361			10-25	22
84.07	Hydraulic engines and motors-----	8-18	4,624	6-6	4,467			8-15	728
84.16	Calendering and similar rolling machines-----	5-14	490			0-0	161		
84.34	Machinery for printing industry-----	1-20	7,837	3-7	16,539	10-36	15,636	3-8	752
84.38	Auxiliary machinery for weaving machines-----	5-21	34,570	5-5	33,638	10-20	763	8-10	7,697
84.40	Machinery for coloring fabrics, printing-----	5-20	14,482	5-8	23,815			8-8	9,617
84.63	Transmission shafts and cranks-----	4-23	7,590	7-7	73,781	8-18	49,919	8-8	11,444

See footnote at end of table.

APPENDIX TABLE 4-G--Continued

Industrial sector BTN headings where possible rate disparities may exist in the United States tariff compared with tariffs of Canada, Japan, and the European Community 1/

BTN number	Abbreviated BTN description	United States		Canada		Japan		European Community	
		Tariff	Imports	Tariff	Imports	Tariff	Imports	Tariff	Imports
		range	1,000 ad val.	range	1,000 ad val.	range	1,000 ad val.	range	1,000 ad val.
85.01	Electrical goods: i.e., generators and motors	5-25	77,203	5-9	83,004	5-20	82,466	5-15	17,716
85.09	Electrical lighting and signaling equipment for motor vehicles	4-19	6,478	7-9	6,304			8-15	499
85.10	Portable electrical battery lamps	14-35	3,300	8-13	3,453			10-10	137
85.12	Electric heaters	4-17	14,511	7-12	15,636				
85.16	Electric traffic control equipment	4-19	190	6-6	1,565			8-8	14
85.20	Electric filament lamps; arc lamps	4-18	22,035	6-8	15,656			8-10	2,012
85.26	Insulating fittings for electrical machines	1-20	2,070	7-14	5,679			8-8	337
86.05	Railway passenger cars	18-18	86	5-5	24			8-8	11
86.07	Railway freight cars	18-18	772	5-6	1,013			8-8	0
86.10	Railway track fixtures and fittings	7-10	0			0-0	0		
87.12	Parts for cycles	4-21	21,509	8-10	4,586			10-10	420
88.02	Flying machines	5-15	61,133	5-15	269,767				
89.05	Floating structures other than vessels	10-10	55			0-0	0		
90.01	Lenses and prisms, unmounted	5-25	4,951	9-14	5,435	8-18	3,938	8-10	1,232
90.02	Lenses and prisms, mounted	10-21	20,242					8-10	1,374
90.03	Frames and mountings for spectacles	15-15	9,071			5-15	5,519		
90.04	Spectacles	15-23	11,896	10-10	828			10-20	517

## APPENDIX TABLE 4-I

Industrial sector BTN headings where possible rate disparities may exist in the European Community's tariff compared with tariffs of the United States, Canada, and Japan 1/

BTN number	Abbreviated BTN description	European Community		United States		Canada		Japan	
		Tariff range	MFN imports	Tariff range	MFN imports	Tariff range	MFN imports	Tariff range	MFN imports
		Percent ad val.	1,000 dollars	Percent ad val.	1,000 dollars	Percent ad val.	1,000 dollars	Percent ad val.	1,000 dollars
25.01	Common salt	15-19	98	5-5	8,541	5-5	2,776	5-5	32,175
28.17	Sodium hydroxide and peroxides of sodium or potassium	5-11	736	1-5	1,103				
28.27	Lead oxides	11-11	2,004	1-16	5,732				
28.51	Isotopes and their compounds, inorganic or organic	6-10	4,068			0-0	550		
28.56	Carbides	4-13	6,478	2-17	16,367				
29.01	Hydrocarbons	3-13	107,436					3-10	33,507
29.04	Acyclic alcohols and their halogenated derivatives	4-13	24,563	3-46	6,975				
29.08	Ethers and alcohol peroxides	7-13	4,401	1-23	6,360				
29.13	Ketone-function and quinone-function compounds	6-12	8,692	1-20	9,680				
29.16	Alcohol-acids and oxygen-function acids	4-12	7,146	2-26	5,375				
29.23	Oxygen-function amino-compounds	7-19	15,660	5-30	12,997				
29.35	Heterocyclic compounds	5-13	94,739						31,213
29.43	Sugars; sugar esters	15-20	944	10-40	236			10-25	138
30.03	Medicaments	6-17	84,066	0-26	11,952				
30.05	Synthetic organic dyestuffs	8-14	57,345	4-30	26,434				
33.01	Essential oils	2-13	27,485	2-13	30,344				
35.01	Casein	2-14	10,916	3-8	24,948				
36.04	Percussion and detonating caps	12-12	1,243	0-6	780	0-0	0		
39.01	Condensation and polyaddition products	7-14	71,798	3-23	8,623				
42.02	Travel goods, of leather, textile fabric, paper-board, etc.	8-15	10,747	4-21	72,569				
44.05	Wood sawn lengthwise	10-10	556,956			0-0	30,392		
45.03	Articles of natural cork	16-16	11,237	5-20	1,964	0-0	862		
45.04	Agglomerated cork and articles	16-16	6,888	5-20	2,207	0-0	823		
48.01	Paper and paperboard, in rolls or sheets	3-12	423,381	1-34	910,663				
48.03	Parachute	13-13	5,525	3-8	2,404				
48.04	Composite paper, in rolls or sheets	13-13	2,972	3-10	28				
48.05	Paper and paperboard, corrugated in rolls	13-14	5,371	3-25	1,999				
48.06	Paper and paperboard, ruled, lined, and squared, in rolls	13-13	173	1-9	127	0-0	0		
48.07	Paper and paperboard, impregnated, coated, and printed	10-12	50,316	1-25	5,089				
48.08	Filter blocks and plates of paper pulp	13-13	376			0-0	0	3-3	5
48.11	Wallpaper	13-13	6,718	2-8	3,630				
48.14	Writing blocks and envelopes	15-15	920	4-10	856				
48.15	Other paper and paperboard, cut to size or shape	7-12	16,619	1-10	3,397				
48.16	Boxes and bags of paper and paperboard	15-15	6,391	3-9	1,631				
48.17	File boxes and storage boxes, of paper and paperboard	14-14	69	3-9	54				
48.18	Registers and notebooks, of paper and paperboard	15-15	1,915	4-10	4,065				
48.19	Paper and paperboard labels	14-14	1,343	3-10	449				
48.20	Bobbins and spools, of paper and paperboard	14-14	289	4-9	683				
48.21	Other articles of paper pulp	7-14	11,333	4-19	11,293				
49.03	Children's picture books	13-13	227	0-0	676			0-0	135
49.10	Calendars	10-10	1,365			0-0	0		
51.02	Monofil, of manmade fibers	5-11	4,201	1-83	1,678				
51.03	Yarn of manmade fibers	9-10	258						
51.04	Woven fabrics of manmade fibers (continuous)	13-15	22,125			5-32	31,126		
54.05	Woven fabrics of flax or ramie	16-16	3,098	3-68	25,670				
55.09	Other woven fabrics of cotton	13-15	75,906			3-23	38,303		
56.06	Yarn of manmade fibers (discontinuous)	14-14	116			0-0	0		
57.10	Woven fabrics of jute	15-22	9,005	3-23	181,425	0-0	22,972		
58.01	Carpets, knotted	12-20	68,522	6-17	12,753				
58.02	Other carpets	11-23	21,692	6-30	30,931	10-33	12,795		
59.04	Twine, cordage, and rope	13-13	3,578	3-28	39,582				
59.05	Nets of twine or cordage	10-14	384	4-53	1,102				
60.02	Gloves and mittens, knitted or crocheted	20-20	3,645	10-64	8,835			10-14	188
60.05	Other garments, knitted or crocheted	11-18	53,139	6-43	228,037				
60.06	Knitted or crocheted fabric, elastic	11-16	7,447	6-40	900				
61.03	Men's and boys' undergarments	17-17	28,703	3-43	30,857				
61.05	Handkerchiefs	11-14	6,019	3-55	10,000				
61.08	Collars, yokes, and accessories for women's garments	11-11	212			0-0	0		
61.10	Gloves, not knitted or crocheted	15-15	1,024			0-0	0		
62.02	Bed linen and table linen	17-19	16,301	4-43	37,601				
62.03	Sacks and bags, for packing goods	8-20	20,173	4-40	1,115			8-20	144
62.04	Tarpaulins, sails, and tents	15-16	5,803	6-25	0				
64.01	Footwear with outer soles and uppers of rubber	20-20	8,049	6-38	55,613			10-10	3
64.02	Footwear with outer soles of leather or composition leather	8-20	35,422	3-20	199,793			10-30	2,065
64.06	Gaiters and spats	10-10	32			0-0	0		
66.03	Parts of umbrellas and walking sticks	7-15	339			0-0	1,255		
69.10	Sinks, wash basins, and bathtubs	12-18	1,442					8-8	59
69.11	Tableware, of porcelain or china	24-26	10,921	13-60	35,179	10-20	4,130	8-8	66
69.12	Tableware, of other kinds of pottery	8-16	7,011	3-60	23,097				
69.13	Statuettes, of pottery and china	8-28	4,187	3-23	24,351			8-8	282
70.02	Glass fiber, yarns, and fabrics	11-13	7,259	3-28	1,033				
71.16	Imitation jewelry	12-18	6,462	8-35	20,268				
73.19	High-pressure hydro-electric conduits of steel	10-10	264			0-0	0		
74.06	Copper powders and flakes	2-10	1,806			0-0	921		
76.04	Aluminum foil	12-12	4,557	2-20	4,979				
76.06	Tubes and pipes, of aluminum	12-12	2,064	2-10	2,567				
78.03	Wrought plates of lead	10-10	279			0-0	0		
78.04	Lead foil	3-10	518			0-0	0		
81.01	Tungsten, unwrought or wrought	6-10	3,681			0-0	1,808		

See footnote at end of table.

## Appendix Chart 4-A.--Industrial Sectors: Tariff and trade profiles

Distribution, by duty level, of MFN tariff provisions and imports of Canada, United States, Japan, the European Community and the United Kingdom

Industrial Sectors

- I-1 Nonelectrical machinery
- I-2 Transport equipment
- I-3 Ores, metals and metal manufactures
- I-4 Chemicals
- I-5 Textiles
- I-6 Electrical machines and apparatus
- I-7 Pulp, paper and paperboard, and manufactures
- I-8 Coal, petroleum, natural gas
- I-9 Mineral products and fertilizers, ceramic products and glass
- I-10 Professional, scientific and controlling instruments, photographic apparatus, clocks and watches
- I-11 Wood and cork and manufactures
- I-12 Precious stones, precious metals and manufactures
- I-13 Rubber and rubber manufactures
- I-14 Raw hides and skins, leather and furskins and manufactures
- I-15 Footwear and travel goods
- I-16 Musical instruments, sound recording or reproduction apparatus
- I-17 Firearms, ammunition, tanks and other armored fighting vehicles
- I-18 Furniture
- I-20 Photographic and cinematographic supplies
- I-21 Works of art and collectors' pieces
- I-22 Office and stationery supplies
- I-23 Manufactured articles not elsewhere specified

**TARIFF AND TRADE PROFILES**  
**Industrial Sector 1-1. --Nonelectrical Machinery**

1/ "World" data represent the average of data for 12 developed countries plus the European Community. It is calculated on the basis of the individual country averages using as a weight the corresponding value of national MFN imports.

## Chapter V

# THE NATURE AND EXTENT OF TARIFF CONCESSIONS GRANTED IN TRADE AGREEMENTS BY THE MAJOR TRADING NATIONS

### Introduction

The trade agreements program conducted by the United States for the reduction of tariffs and other trade barriers dates from the passage of the original Trade Agreements Act of 1934. That act authorized the President for the succeeding three years to enter into executive commercial agreements with foreign countries to provide for the reciprocal reduction of tariffs and other barriers to international trade whenever he found that existing duties or other import restrictions of either the United States or a foreign country were impeding the foreign trade of the United States. The act was signed June 12, 1934; it was subsequently amended or extended on 11 occasions. On October 11, 1962, a successive act--the Trade Expansion Act of 1962--became law, providing the President with such authority through June 30, 1967. <sup>1/</sup> The trade negotiations and other actions taken under this legislation have constituted the trade agreements program.

Between 1934 and 1947, the United States entered into bilateral trade agreements with 29 countries under the authority of the Trade Agreements Act of 1934 and its extensions. In 1947, the General Agreement on Tariffs and Trade (GATT), a multilateral agreement, was negotiated. Since then,

---

<sup>1/</sup> For the remainder of the chapter, the term "Trade Agreements Acts" will be used to refer collectively to the original Trade Agreements Act of 1934, the 11 extensions and amendments of that act, and the Trade Expansion Act of 1962.

Since the expiration of the authority granted in the Trade Expansion Act, the President has not held authority to negotiate reductions in U.S. tariffs. A request for new authority is pending before the Congress in the proposed Trade Reform Act of 1973.

five additional major multilateral "rounds" of negotiations have been conducted under the GATT for additional reductions in tariffs, plus numerous subsidiary negotiations.

During the period since 1934, the United States has also negotiated tariff concessions in agreements which were outside the regular trade agreements program and implemented under authorities other than that contained in the Trade Agreements Acts. These were preferential rates of duty applicable to products of the Philippines under a bilateral trade agreement with the Philippines, preferential duty-free treatment for automotive products of Canada under a bilateral agreement with that country, and duty-free treatment for certain cultural, scientific, and educational materials under the Florence and Beirut Agreements.

In this chapter an effort is made to show the cumulative effect of all of these agreements on the average tariff levels of the United States, Canada, Japan, the United Kingdom, and the European Community. Some other aspects of the trade agreements to which the United States has been a party and which contain tariff concessions also are discussed briefly.

## The Format of Trade Agreements

The trade agreements negotiated by the United States under the authority of the Trade Agreements Acts usually have consisted of two interrelated parts--"general provisions" and "schedules." The "general provisions" enumerate the respective principles and rules by which the contracting parties agree to govern their mutual trade. The "schedules" constitute lists of tariff concessions granted by the negotiating parties.

### "Provisions" in trade agreements

The general provisions in trade agreements serve various purposes. Usually, they set forth rules of fair play to govern the conduct of trade between the parties. The "most-favored-nation" (MFN) clause and the "national treatment" clause are examples of such rules. The MFN clause requires the contracting parties to an agreement to accord to one another's products import treatment no less favorable than that accorded the most "favored" nation. In the national treatment clause, each contracting party agrees not to apply internal taxes or regulations affecting the sale of products of other contracting parties in its market that are more burdensome than those levied on its own domestic products.

The general provisions often either define the limits within which specified discriminatory or restrictive measures may be employed 1/ or prohibit their use altogether. 2/ Many of them are designed to prevent the

---

1/ Article XII of the GATT, which is an example of such a provision, provides that a contracting party experiencing balance-of-payments difficulties may impose import restrictions when necessary to prevent a serious decline in its monetary reserves or, if its reserves are already low, to effect a reasonable increase therein.

2/ Article III of the GATT prohibits the use of internal taxes and other internal regulations as a substitute for tariff protection.

impairment of the tariff concessions contained in the agreement by such measures as discrimination in tax matters or the establishment of quotas and exchange controls. Other general provisions (commonly called safeguard provisions 1/) are designed to prevent or limit injury to domestic producers that might result from the concessions granted. Still other provisions deal with procedural matters, such as the date when the agreement is to become effective, as well as how and when the agreement may be terminated.

Some general provisions appeared in virtually the same form in all bilateral U.S. trade agreements negotiated prior to the GATT. The form and scope of other general provisions, however, varied from agreement to agreement because conditions governing the trade with some countries required safeguards and exceptions not applicable to the trade with others, or new developments in international economic relations called for changes in the general provisions.

The general provisions embodied in the GATT were much more extensive than those that appeared in the individual bilateral trade agreements, and some dealt with matters not contained in any earlier agreement. The more extensive nature of the provisions in the General Agreement is attributable, in part, to the fact that forces encountered in the economies of a large number of countries are more complex than those encountered by only two trading partners, to the inherent differences between a multilateral and bilateral agreement, and to the fact that the negotiators sought to cover almost every facet of world trade.

---

1/ Article XIX of the GATT contains the standard "escape clause." This safeguard provision has been required by law to be included in U.S. trade agreements since 1947.

Most-favored-nation clause.--The unconditional most-favored-nation (MFN) clause has been incorporated in all trade agreements negotiated under the Trade Agreements Acts 1/ and has been the keystone of the trade agreements program. The unconditional MFN principle was adopted by the United States in 1923, but it was linked for the first time with an active tariff bargaining policy under the Trade Agreements Act of 1934.2/ Since 1934, the United States has made commitments to foreign countries to extend them MFN treatment in bilateral trade agreements, in the General Agreement on Tariffs and Trade, and in commercial treaties. 3/ Article I of the GATT provides for unconditional most-favored-nation treatment among parties to the agreement.

In most instances, certain exceptions to the MFN clause are provided. For example, Article I of the GATT permits a contracting party to continue to apply tariff preferences that existed when it acceded to the agreement. The absolute margin of preference thus sanctioned, however, cannot be increased above those existing on a specified base date. 4/ The GATT permits

---

1/ Agreements negotiated with Cuba under the Trade Agreements Acts, however, provided for reciprocal preferential treatment so far as tariffs were concerned.

2/ MFN treatment has been withdrawn from specific countries on several occasions. It was denied to imports from Nazi Germany after October, 1935; suspended for imports from Australia between August, 1936 and January, 1938; and in 1951, the Trade Agreements Extension Act withdrew MFN treatment from imports from Communist countries.

3/ Such treaties are usually referred to as Treaties of Friendship, Commerce, and Navigation or Treaties of Amity and Economic Relations.

4/ The General Agreement prohibits increases of tariff preferences on all articles, whereas the pre-GATT trade agreements negotiated by the United States generally permitted increases in preferences unless the article involved was specifically the subject of a tariff concession. The GATT further prohibits preferences in export tariffs; the pre-GATT agreements to which the United States was a party generally did not forbid the use of preferential export tariffs.

other preferences within the framework of a customs union or free-trade area. Examples of such preferential arrangements include the European Economic Community, the European Free Trade Association, and the Latin American Free Trade Association. The General Agreement stipulates, however, that when such regional arrangements enter into force the tariff and other restrictions imposed on trade with countries outside the region are not to be more burdensome, on the whole, than the general level of such restrictions prior to the formation of the union.

"Schedules" in trade agreements

The "schedules" in trade agreements are lists of the specific concessions exchanged by the negotiating parties on tariffs and certain other aspects of import treatment applicable to individual products. The concession rates of duty set forth in a schedule represent the maximum rates that will apply to imports of the designated products from the other contracting party (or parties) to the agreement. The rates may represent reductions from former levels, or a "binding" of an existing rate of duty or duty-free treatment. The commitment is to apply rates no higher than those in the schedule; the respective government may apply still lower rates without violating its concession. The schedules may also stipulate quantities of an article which will be accorded the agreed treatment. For example, some concessions obtained and granted by the United States in bilateral agreements took the form of increased or stabilized quotas already applicable to imports.

Except for the preferential tariff agreements with Cuba, the Philippines, and Canada (automotive products only), under the unconditional MFN

policy of the United States, the rates of duty contained in U.S. schedules to trade agreements usually have been extended not only to imports from the agreement country (or countries) but also generalized to all countries whether or not obligated to do so in international agreements so long as the recipient did not discriminate against U.S. trade. 1/ Many other countries have followed a similar practice.

Bilateral agreements normally embody two schedules of concessions. More than 70 schedules have been annexed to the General Agreement on Tariffs and Trade. Most contracting parties to the General Agreement have attached separate schedules of concessions to the agreement upon their accession. Some contracting parties, however, and especially certain of the newly-independent African states, have acceded without attaching schedules. Certain other newly-independent states annexed schedules of concessions in their own right that previously had been included on their behalf in the schedule of the respective metropolitan country. When the European Economic Community was formed, a consolidated schedule was annexed for its six member countries, and individual member state schedules were simultaneously withdrawn. U.S. concessions under the GATT appear as Schedule XX to that agreement.

---

1/ Until September 1951, this included all countries. At the present time it includes all countries except the following: Albania, Bulgaria, Peoples Republic of China, Cuba, Czechoslovakia, Estonia, East Germany, Hungary, any part of Indochina under Communist domination or control, North Korea, the Kurile Islands, Latvia, Lithuania, Outer Mongolia, Romania, Southern Sakhalin, Tanna Tuva, Tibet, and the Union of Soviet Socialist Republics.

## The Nature of Tariff Concessions

In trade agreement parlance, a tariff "concession" signifies any one of three possible situations, each of which may be the result of a variety of undertakings in the trade agreement:

- (1) The first, and most obvious, is a commitment to apply in the future a lower tariff than has been applied prior to the agreement;
- (2) The second is a commitment not to apply a tariff higher than the existing duty (or not to apply a duty, if none is being applied); and
- (3) The third is not to increase an existing tariff (or not to apply a new duty on free items) above a stipulated higher level.

The first of these types of concessions is, quite naturally, called a tariff reduction. The second is referred to as a "binding," and the third as a "ceiling binding." The United States has granted and received all three types of tariff concessions in trade agreements to which it is (or has been) a party.

Tariff concessions usually are set forth in a detailed list of individual products with the concession rate of duty applicable to each product. In some cases, however, the tariff treatment or "concession" may be set forth in the general provisions of an agreement as a principle or rule applicable to all products, or to a large category of products. In the 1934 bilateral agreement with Cuba, for example, a general provision of that agreement stipulated that in trade between the United States and Cuba all items then free of duty were bound free, and all dutiable items not enumerated in an attached schedule would be given preferential tariff treatment of a specified amount below the lowest tariff rate applicable to

products from any other country. The schedule of exceptions to this general rule listed products which were to get greater preferences than that applicable under the general rule. Another example is found in the U.S.-Canadian Automotive Products Agreement where a general provision specified duty-free treatment on a broad category of products traded between the two countries <sup>1/</sup> without identifying the numerous individual tariff items involved.

Some very important tariff concessions obtained by the United States have been of this "general" character. For example, since the early 1930's Canada has had a 3-column tariff: A general rate of duty applicable to imports from countries not receiving MFN treatment, a usually lower intermediate rate applicable to products of MFN countries, and a still lower preferential rate applicable to Canadian imports from countries of the British Commonwealth. Prior to the first U.S.-Canadian bilateral agreement under the trade agreements program in 1936, U.S. shipments into Canada were assessed the general rate. By virtue of the most-favored-nation provision of the 1936 bilateral agreement, all U.S. goods became dutiable at the MFN rates of the Canadian tariff. Forty-three percent of the dutiable Canadian imports from the United States at the time of the agreement underwent duty reductions as a result of this provision alone (not including any imports covered by scheduled concessions). Similar in character, though covering a smaller volume of trade, were the benefits obtained through the MFN provision of the 1936 trade agreement with France.

---

<sup>1/</sup> For imports into the United States, certain classes of vehicles and "fabricated components for use as original equipment in the manufacture of motor vehicles."

Qualifications are frequently attached to particular concessions. For example, a quota may be set for imports which will be allowed to enter under the reduced rate; imports are permitted in excess of the tariff quota, but the excess is subject to unreduced duties. Or a country may reserve the right to impose at a later time a restriction on the quantity of imports which may enter at the reduced rates. For example, with respect to U.S. concessions on wool fabrics negotiated at Geneva in 1947, the United States reserved the right to impose a duty of 45 percent ad valorem (instead of the concession rate of 25 percent) on imports of wool fabrics in excess of 5 percent of the average annual production of similar fabrics in the United States during the three preceding years. On a few occasions, absolute quotas have been stipulated in trade agreements.

For items, imports of which are subject to monopoly control in the foreign country, the schedule of concessions has frequently specified the minimum amounts which the monopoly undertakes to import annually.

The concessions may be conditional upon other actions being taken or the existence of a stipulated situation. In the Kennedy round, for example, the European Community made its concessions upon certain textiles conditional upon the continuance in force of the Long Term Arrangement on International Trade in Cotton Textiles, whereupon the United States made its concessions on cotton textiles conditional upon the continuance in force of the European Community's concessions.

Tariff reductions have sometimes been conditional upon continuance of absolute quotas on imports of the product. The United States, for example, reserved the right to suspend the reduced duty on certain raw cotton at

any time when there was not an absolute quota in effect on imports of such cotton into the United States.

In granting tariff concessions, countries very frequently have limited the concession to a subclass of goods in a tariff item. New subitems are carved out of the provision in order to confine the duty reduction to a smaller category of imports, such as products within a certain price range, or products imported in certain periods of the year, or products destined only for certain uses or constructed in a specified manner.

Another aspect of tariff concessions is the relationship of the concession rate to the rates which will be applied to competing imports from other countries. An important feature of the tariffs of the former British Dominions was preferential tariff treatment of imports from British sources, and after World War I, the same feature was found in the United Kingdom's tariff treatment of imports from the Dominions. Agreements negotiated in Ottawa in 1932 greatly expanded and intensified this preferential system, so that the preferences in the United Kingdom on many articles became more disadvantageous to the position of the United States in the markets of the United Kingdom than the level of duties as such. Similarly, preferences by other members of the Commonwealth on imports of many manufactured goods from the United Kingdom became of major importance to the competitive position of United States manufacturers in those markets. Consequently, substantial curtailment of the British imperial-preference system became one of the major objectives of the United States in its trade agreement negotiations.

In the bilateral agreements of the 1930's negotiated with Canada and the United Kingdom, the extent of discrimination under the imperial-preference system was lessened for those U.S. products on which duties were reduced, but Canada and the United Kingdom still remained free to introduce new preferences or to increase existing preferences so far as this could be done without increasing rates of duty on imports from the United States. Under the General Agreement on Tariffs and Trade, however, this freedom of action became greatly restricted through limitations on the scope and degree of preferences. A provision of the general articles of the GATT permits continuation of preferential arrangements existing at the time a country accedes to the agreement, but stipulates that new preferences may not be introduced and existing preference margins may not be increased. This general provision, taken by itself, involved a substantial concession on the part of the British Commonwealth countries. It not only protected the specific tariff concessions made under the GATT against serious impairment from subsequent increases in the margins of preference, but also, for the many commodities which were not originally covered by the schedules of concessions, its effect was equivalent in importance to the binding of the previous tariff treatment.

During the past few years, however, as a result of the proliferation of customs unions, free trade areas, and association agreements between such bodies and other countries, there has been some derogation of the significance of the GATT provision dealing with preferential trading arrangements. 1/

1/ See chapter IV, p. 110.

## The Extent of Tariff Concessions

Tariff concessions made in trade agreements in which the United States has participated as a negotiating party now cover the great bulk of the rate provisions in the tariff schedules of the principal trading nations. The current MFN rates of duty applied by each of the large trading countries reflect a few thousand concessions negotiated in such agreements; for all countries with which the United States has negotiated since 1934, the concessions would total several thousand.

It is obviously impossible to examine the scope of each of these concessions individually, yet there is no really satisfactory method to measure the extent of tariff concessions in the aggregate. Three types of measures have been commonly used. These are the amount of trade covered, the portion of a country's rate provisions involved, and the reduction in the average tariff level resulting from the concessions. All three measures have limited usefulness, however, as indicators of the real value of the concessions, which can only be determined in terms of the economic effect which follows after the concessions have been implemented. The trade coverage of a given group of concessions could be expected to change from year to year. <sup>1/</sup> In addition, the third measure--the reduction in the average tariff level--has serious practical and theoretical shortcomings, particularly if the comparison of average duty levels covers a long span of time.

---

<sup>1/</sup> If the purpose of the concessions was to increase trade, and if this purpose is accomplished, the trade coverage of concessions could be expected to increase over time, both absolutely and in proportion to total trade of a country.

Coverage of concessions in terms of trade  
and tariff provisions

The United States has made tariff concessions on 98 percent of the provisions in its tariff schedules. In 1972, imports under the items not covered by tariff concessions were valued at \$952 million, which was 1.5 percent of total U.S. imports. About one-third of these no-concession imports entered free of duty. The tariff concessions have reduced the rates on virtually all dutiable items and bound the duty-free status of practically all free items in the U.S. tariff schedules. One-fifth of the items not in trade agreements are in the industrial sector, 80 percent are agricultural products. All except a very few of the concessions are in the U.S. schedule annexed to the General Agreement on Tariffs and Trade. <sup>1/</sup>

Available data on the tariff concession coverage for other countries is segregated between industrial and agricultural products and covers only concessions under the GATT. Table 5-A shows the percentage of coverage in tariff provisions and in imports in the industrial sector for the European Community and 10 other developed countries. The United States, the European Community and Switzerland have 98 percent or more of their industrial MFN tariff provisions fully covered by GATT tariff concessions. Japan, the United Kingdom, and Sweden have at least 90 percent of their provisions fully covered, but Canada has only 74 percent of its tariff lines in the industrial sector under GATT concessions.

For most of the 11 country tariffs shown in table 5-A, the trade coverage of concessions runs lower than the tariff line coverage. For the

---

<sup>1/</sup> The only significant concession item not in the U.S. GATT schedule is crude petroleum, on which a concession has been made in the bilateral agreement between the United States and Venezuela.

Table 5-A.--Industrial products: Percent of MFN tariff provisions and of MFN imports covered by tariff concessions under the General Agreement on Tariffs and Trade in selected industrialized countries

Country	Tariff provisions		Imports	
	Fully covered by concessions	Partially covered by concessions	Fully covered by concessions	Partially covered by concessions
	Percent	Percent	Percent	Percent
European Community----	98	1	100	-
United States-----	99	1	1/ 90	1/ 10
Canada-----	74	-	59	1
Japan-----	90	1	64	-
United Kingdom-----	93	1	66	2
Austria-----	86	1	83	1
Denmark-----	87	4	93	4
Finland-----	85	1	87	2
Norway-----	79	2	64	2
Sweden-----	94	1	96	1
Switzerland-----	98	-	90	1

1/ The principal industrial product in the U.S. tariff not fully covered by GATT concessions is crude petroleum, which accounts for most of the imports shown as only partially covered by GATT concessions. Crude petroleum, however, is covered by tariff concessions in the bilateral trade agreement between the United States and Venezuela.

Note.--Rounding of the data in this table results in some minor inaccuracies. The United States, for example, is shown as having 100 percent of its industrial tariff provisions and imports either wholly or partly covered by tariff concessions under the GATT, but there are actually a very few items which are not covered by tariff concessions in any trade agreement.

European Community, all but an insignificant fraction (less than one-half of one percent) of industrial imports are covered by GATT concessions. For the United States, 90 percent of MFN imports are fully covered by GATT concessions, and the remainder are partially covered. (Most of the U.S. imports not under GATT concessions are covered by bilateral trade agreements). For the other three major countries, the trade coverage of GATT concessions is much lower. Only 59 percent of Canada's MFN imports enter under tariff provisions fully covered by GATT concessions. In the case of Japan and the United Kingdom, full GATT coverage applies to only 64 and 66 percent of industrial imports, respectively.

In the agricultural sector, the data on the coverage of concessions have been compiled only in terms of tariff provisions, and only for the five major tariffs (the European Community, the United States, Canada, and Japan, and the United Kingdom). It was not practicable with the data readily available to calculate the trade coverage.

Generally speaking, the concession coverage in the agricultural sector is significantly less than in the industrial sector. The tariff line coverage for the agricultural sector is shown in table 5-B. Comparison of the data in that table with corresponding figures for the industrial sector shows a striking contrast. Almost half of the agricultural provisions in the United Kingdom tariff schedule, and three-fourths of those in the Canadian agricultural schedule, have not been the subject of GATT tariff concessions. For Japan, the percentage is 32; for the European Community, 42; and for the United States, 7.6.

Table 5-B.--Agricultural products: Percent of MFN tariff provisions covered by tariff concessions under the General Agreement on Tariffs and Trade in the principal trading nations

Country	Provisions fully covered	Provisions partially covered	Provisions with no concessions
	Percent	Percent	Percent

### Reduction in average tariff levels

It has been explained in chapter IV of this report that the only practical way to characterize national tariffs at the aggregate level for comparison purposes is to average the individual tariff rates contained in the schedule, but that there is no really satisfactory method for averaging tariffs. <sup>1/</sup> The practical and theoretical difficulties in averaging tariffs are doubly compounded if the comparison is to be between average tariff levels at different points in time, and especially if the purpose of the comparison is to determine the amount of change due to a single factor, such as modification in the nominal rates of duty.

Movements of tariff levels over time.--The change in a country's average tariff level over time is a function of three factors: Changes in the individual nominal rates of duty in the tariff schedule; changes in the prices of products subject to specific rates of duty; and changes in the composition of imports, which are used as weights in calculating the average level of the tariff.

In 1933, the year before the first agreement was concluded under the reciprocal trade agreements program, the ratio of total U.S. duties collected to the total value of U.S. dutiable imports was 53.6 percent. In 1972, it was 8.6 percent, an apparent reduction of 84 percent. This very substantial decline is the net result of contradictory forces. Between 1933 and 1972, there was a remarkable change in the composition of U.S. imports, one aspect of which is illustrated by the shift in the relative

---

<sup>1/</sup> See chapter IV, pages 3-23, for a discussion of problems in comparing national tariffs.

importance of dutiable and free products. <sup>1/</sup> If other factors (intentional rate reductions and inadvertent rate reductions through price increases of specific duty products) had not intervened, this change in product composition undoubtedly would have resulted in a higher average duty level in 1972 than in 1932. The direction of force of both the other determining factors, however, was downward, and these factors were of sufficient strength to more than counterbalance the upward push from the greater importation of dutiable merchandise. The majority of tariff rates were cut during the period by 50 percent or more in trade negotiations. The very significant rise in the general price level between 1933 and 1972 meant a correspondingly significant drop in the ad valorem equivalent of specific duties.

The significance of inflation for specific rates.--In considering the reduction that has taken place in the average level of the U.S. tariff, it is important to appreciate the strong role which the rise in prices has played. Almost 40 percent of U.S. tariff provisions have specific rates of duty, and it is estimated that more than half of U.S. dutiable imports currently are assessed specific rates. The ad valorem equivalent of a specific duty, of course, varies inversely with the price of the commodity. The much higher prices of 1972, therefore, have greatly reduced the average

<sup>1/</sup> The ratios of dutiable and free imports to total U.S. imports in 1933 and 1972 were as follows:

	<u>1933</u>	<u>1972</u>
Dutiable-----	36.9	65.8
Free-----	63.1	34.2
Total-----	<u>100.0</u>	<u>100.0</u>

ad valorem equivalent of the specific duties as a group. The Department of Commerce compiles indexes (on the basis of 1967 = 100) of the foreign unit values of import commodities. In 1933 this index stood at 26.9; by 1972 it had more than quadrupled and risen to 126.1. In other words, a duty of 20 cents per pound on an article valued at \$1.00 per pound in 1933 was equivalent to 20 percent ad valorem at that time, but in terms of 1972 price levels, it was equivalent to only 4.3 percent. The duty, in effect, has been reduced by 77 percent simply by the rise in prices.

Other factors besides the change in prices also may lessen the validity of comparisons of duty averages on the basis of actual imports and duties collected, especially if the years compared are far apart, or if abnormal factors have intervened. In 1933 the world was in the depths of a severe depression; since then, in addition to inflation, it has undergone a devastating global war, a far-reaching technological revolution, and currency devaluations and revaluations. All of this has been accompanied by important changes in tariffs and other trade barriers. The big advance in prices alone, however, is sufficient to render the change in the ad valorem equivalent calculated from actual imports and duties collected inappropriate as a measure of the change in tariff level attributable to trade agreement concessions.

Ratios of duty collections to actual imports.--Although not appropriate as a measure of the extent of tariff reductions made by trade agreements, the ratio of duty collections to total imports of a country can be useful as a very rough but imperfect indicator of the average level of a country's tariff at a point in time. These ratios are shown in table 5-C for nine

countries for six selected years, beginning with 1930. <sup>1/</sup> The ratios for dutiable imports alone were obtainable for only three countries, the United States, Canada and West Germany; these are shown in table 5-D.

Table 5-C.--Ratios of duties collected to total imports for selected countries in specified years, 1930-60

(Percent)						
Country	1930	1934	1939	1950	1955	1960
United States-----	13.7	18.4	14.4	6.1	5.9	7.2
Canada-----	16.2	16.5	14.0	8.8	10.5	9.8
Belgium-----	4.5	10.7	7.4	4.0	3.4	3.1
France-----	10.0	21.4	30.4	4.6	5.1	5.6
Italy-----	15.5	21.6	14.7	3.4	8.3	6.7
West Germany-----	11.7	26.2	30.8	7.5	7.7	7.1

<sup>1/</sup> For the United States, the ratios for all years since 1930 are shown in appendix table 5-A.

Calculating changes in average duty levels made by tariff concessions.--

In order to show the change in a country's average tariff level which has resulted from tariff concessions made in trade agreements, it is necessary at least to remove the effect of price changes on the ad valorem equivalent of specific rates by applying both the preagreement rates and the postagreement rates to the imports of one year. This method, though not perfect, is the only one that can give results of even approximate validity. It must be recognized that no single year can fully represent the relative importance of different individual commodities for the purpose of weighting the averages. <sup>1/</sup>

It is important to bear in mind that the principal purpose in making such a calculation is not to show actual average rates of duty before and after the trade agreements, but to show the average percentage by which duties have been reduced as a result of trade agreement concessions. So long as the import statistics of the same year are used as weights for both preagreement and postagreement rates of duty, the selection of that year should have only a relatively small influence on the average percentage of duty reduction.

For the present study, an attempt has been made to carry out such calculations for the tariffs of the United States, the European Community,

---

<sup>1/</sup> This defect might be lessened, though not entirely eliminated, by the use of average annual imports over a series of years for weighting, but this very laborious procedure would hardly be justified by the degree of superiority in the results. Another and more fundamental defect is inherent in the very nature of weighting. It results from the tendency of duties to restrict imports of some commodities, and thus lessen the importance of those commodities in determining the average rates of duty. This difficulty cannot be eliminated by any practicable method of procedure (see chapter IV).

Canada, Japan and the United Kingdom. Averages were calculated using tariff rates in effect just prior to the first negotiation between the United States and the respective country for reciprocal tariff reductions under the trade agreements program. Thus, the pre-trade-agreement base year differs for each country and is as follows: United States, 1933; Canada, 1935; United Kingdom, 1938; Japan, 1954; European Community, 1960.

For practical reasons which are explained later, the rates of duty actually used for the pre-trade-agreement base year of each country have been as follows: In the case of the United States, the column 2 rates (which generally reflect rates of duty initially established in 1930); for Canada, the "General" rates, the majority of which were established in the early 1930's; for the United Kingdom, the rates published in the tariff schedule installed in 1933 and in effect at the time the United States first negotiated with the United Kingdom; for Japan, rates shown in the official tariff issued January 1, 1954, and for the European Community, the "Autonomous" rates, which represented arithmetic averages of the four antecedent tariffs of the member countries on January 1, 1957.

The rates used in calculating both the pre- and post-trade-agreement averages are the statutory rates specified in the tariff. Temporary duty suspensions were not taken into consideration.

Enormous practical problems which could not be entirely overcome are involved in attempting such a calculation. The most important of these is the extensive changes in nomenclature which have taken place in all of the tariff schedules since the pre-trade-agreement years. For Canada and the United States, a workable solution to this problem was found in using

Canada's "general" rate and the U.S. Column 2 rate as the pre-trade-agreement rate. For Japan and the United Kingdom, an attempt had to be made, with mixed success, to locate in the old nomenclature products identified according to the present day schedules. 1/ For the European Community, because of the impracticality of tracing products back into the four preceding national tariffs, it was necessary to resort to the rather unsatisfactory compromise of using the "autonomous" rate as the pre-trade-agreement rate. The deficiency of this is that prior to determination of the autonomous rates, the four antecedent national tariffs had undergone significant reductions as a result of bilateral agreements with the United States (with France, Belgium-Luxembourg, and the Netherlands) and the participation of all of the EC member states in the multilateral negotiations under the GATT prior to 1957. 2/

For making the calculations, the requisite detailed trade data at the tariff line level were available on trade in industrial products by the European Community, Japan, and the United Kingdom for a single year (1967), but none were available for trade by Canada. For agricultural products, such data were available only for the United States.

---

1/ Many important products of today, such as computers and other electronic products, plastics and synthetic fibers did not exist when the earlier tariff schedules were in effect.

2/ At the time the EC autonomous rates were established in 1957, the individual national tariff schedules contained over 9,000 concessions under the GATT, of which 55 percent were at rates above the rate established as the EC autonomous rate, 35 percent were below the autonomous rate, and 10 percent were the same as the autonomous rate.

Average reductions in industrial tariffs.--For the five major tariffs which are examined in this study (the United States, Canada, Japan, the European Community, and the United Kingdom), the reductions in the average MFN rates of duty on industrial products made by trade agreements in which the United States participated have been significant. The percent of reduction in each country's average tariff level is shown in table 5-E. <sup>1/</sup> For all industrial products (combined free and dutiable), the reductions range from 25 percent for Japan to 72.1 percent for the United States; for dutiable products only, the range is from a 23.6 percent reduction for Japan to 66.1 percent for the United States. The preagreement rate levels of Canada and the United States were substantially higher than those of the other three tariffs.

The percent of change in average duty level for each industrial product sector is shown for combined free and dutiable industrial imports in table 5-F and for dutiable imports only in table 5-G. The sector data in table 5-F are also presented graphically as tariff profiles "before and after trade agreements" in chart 5-A. As would be expected, there is considerable variation in the extent to which the average duty levels of the 23 industrial sectors have changed between the pre-trade-agreement base dates and January 1, 1972. In terms of combined dutiable and free imports, for example, reductions in average duty levels for the sectors ranged from

---

<sup>1/</sup> It should be borne in mind that for all countries except Canada, the "preagreement rates" shown in table 5-E (as well as those shown in tables 5-F and 5-G and chart 5-A) are the result of applying preagreement tariff rates to values of trade in 1967. As explained in the earlier pages of this chapter, this produces an average rate level which differs from the rate level that would have resulted from using actual trade in each country's base year.

Table 5-E.--Industrial products: Average MFN rates of duty on pre-trade-agreement base dates compared with average MFN rates on January 1, 1972, and average reduction in rates <sup>1/</sup>

Item	(Percent)				
	: Canada :	: United States :	: Japan :	: European Community <sup>2/</sup> :	: United Kingdom :
All industrial products:	:	:	:	:	:
Preagreement rate-----	22.0	21.9	7.6	7.0	13.6
January 1, 1972, rate-----	9.2	6.1	5.7	3.9	5.5
Percent reduction-----	58.2	72.1	25.0	44.3	59.6
Dutiable industrial products:	:	:	:	:	:
Preagreement rate-----	28.4	25.1	14.0	14.2	16.8
January 1, 1972, rate-----	15.2	8.5	10.7	8.0	10.5
Percent reduction-----	46.5	66.1	23.6	43.7	37.5

<sup>1/</sup> Averages for the United States, Japan, the European Community, and the United Kingdom are own-trade-weighted averages, using 1967 trade as weights for Japan, the Community, and United Kingdom, and 1971 trade for the United States. The averages for Canada are simple arithmetic ("unweighted") averages.

Rates of duty used as those in effect on pre-trade-agreement base dates are as follows: For Canada, the General rates; for the United States, the Column 2 rates; for Japan, the rates shown in the official tariff issued on January 1, 1954; for the European Community, the Autonomous rates; and for the United Kingdom, the rates shown in the official tariff issued on January 1, 1933.

<sup>2/</sup> The European Community Autonomous rates (which were used for calculating the EC preagreement average rates were established generally by taking a simple average of the rates contained in the four antecedent national tariff schedules on January 1, 1957. Consequently, the EC "preagreement" averages actually reflect some tariff reductions made in trade agreements negotiated prior to formation of the Community. It was not feasible to determine a pre-agreement rate based on tariffs in effect in 1934, which was just prior to the first reciprocal trade agreement between the United States and an EC member country (see text).

Source: Preagreement rates are calculated from rates shown in national tariff schedules. January 1, 1972, rates are from Basic Documentation for the Tariff Study, GATT.

Part B--Minor Industrial Sectors--Continued

as little as 1.5 percent to total removal of the duty while in some cases a country's average duty level for a sector did not change or actually increased over the period. In those cases where there was no change in the average rate level, the sectors were either free of duty or had low (less than 1 percent) average duty levels prior to the trade-agreements base date. Increases in the average rate level of a sector are the result of raising rates of duty not bound in trade agreements.

The details of these tables and the chart can be summarized in the following frequency distributions showing the number of industrial sectors which each country has in 7 categories of rate change:

For all industrial products

Average reductions in agricultural tariffs.--Chapter IV has discussed the additional difficulties encountered in calculating tariff averages in the agricultural sector, particularly for certain countries such as the European Community which makes extensive use of variable levies rather than fixed tariffs for agricultural products. In addition, the averages which can be calculated for most countries tend to be less meaningful than industrial tariff averages because of the greater prevalence in the agricultural area of absolute quotas and similar controls.

Keeping these important shortcomings in mind, however, an average reduction in the agricultural tariffs has been calculated for the five major tariffs and is presented in table 5-H. The averages shown in the table are simple arithmetic ("unweighted") averages of each country's individual rates; data were not available for most of the countries which would permit calculation of trade-weighted averages. Canada and the United States have had the largest reductions in their average agricultural tariff levels; Japan has had the smallest. The reductions shown for the European Community carry a significant qualification which is spelled out in the footnote to the table.

The percent of change in average duty level for each agricultural product sector is shown for combined free and dutiable agricultural imports in table 5-I and for dutiable imports only in table 5-J. The sector data in table 5-I are presented graphically as tariff profiles in chart 5-B.

Table 5-H.--Agricultural products: Average MFN rates of duty on pre-trade-agreement base dates compared with average MFN rates on January 1, 1972, and average reduction in rates <sup>1/</sup>

(Percent)						
Item	Canada	United States	Japan	European Community	United Kingdom	
All agricultural products:						
Preagreement rate-----	21.6	26.0	21.0	2/ 20.4		13.3
January 1, 1972, rate----	7.3	9.9	17.8	2/ 14.3		8.3
Percent reduction-----	66.2	61.9	15.2	2/ 29.9		37.6
Dutiable agricultural products:						
Preagreement rate-----	24.1	30.3	25.6	2/ 20.8		14.7
January 1, 1972, rate----	12.6	12.4	24.5	2/ 17.2		10.4
Percent reduction-----	47.7	59.1	0.4	2/ 17.3		29.3

<sup>1/</sup> Averages are simple arithmetic ("unweighted") averages.

Rates of duty used as those in effect on pre-trade-agreement base dates are as follows: For Canada, the General rates; for the United States, the Column 2 rates; for Japan, the rates shown in the official tariff issued on January 1, 1954; for the European Community, the Autonomous rates; and for the United Kingdom, the rates shown in the official tariff issued on January 1, 1933.

<sup>2/</sup> For the European Community, the pre-trade-agreement average rates are arithmetic averages of the EC autonomous rates of duty as initially established for every tariff line pursuant to the Treaty of Rome. The EC autonomous rates were established generally by taking a simple average of the rates contained in the four antecedent national tariff schedules on January 1, 1957. Consequently, the EC "preagreement" averages actually reflect some tariff reductions made in trade agreements negotiated prior to formation of the Community. It was not feasible to determine a preagreement rate based on tariffs in effect in 1934, which was just prior to the first reciprocal trade agreement between the United States and an EC member country (see text).

As the European Community's Common Agricultural Policy has been developed, the Community has replaced (or supplemented) several of the original rates of duty with variable levies, none of which reflect concessions under the GATT.

The January 1, 1972, average rates shown for the Community are averages calculated only from tariff lines which continued to be subject to fixed rates of duty on that date. The averages do not include any of the tariff lines subject to a variable levy, nor do they reflect any of the variable levies which have replaced (or supplemented) fixed tariffs. If variable levies could have been taken into consideration, the EC averages would probably have shown a significant increase between the preagreement and January 1, 1972, rates.

Source: Calculated from rates specified in national tariff schedules.

Percent reduction:					
10 or less-----	1	-	3	2	1
10.1-25-----	-	-	3	2	3
25.1-50-----	1	4	1	4	3
50.1-75-----	6	5	-	-	1
75.1 or more-----	1	-	-	-	-
No change-----	-	-	-	-	-
Increase-----	-	-	2	-	1

Presidential authority to reduce duties.--Over the period extending from 1934 to June 30, 1967, during which the reductions in the U.S. tariff discussed in the foregoing pages were negotiated, the Congress actually had delegated to the President tariff reduction authority which, on a cumulative basis, would have permitted lowering U.S. tariffs to a level at least 91.5 percent below the level existing in 1934 when the trade agreements

---

1/ Changes in duty rates are calculated on the basis of fixed duties only. The EC sector for grains, in which all provisions are covered by variable levies, is not included.

program was begun. (Use of "special" authorities contained in the last two trade agreements acts permitted even greater reductions.) The actual effect which maximum use of the basic reduction authority contained in the trade agreements acts over the years could have had on various rate levels is shown in table 5-K.

Table 5-K.--Possible reductions in U.S. tariff levels using the maximum basic authority granted under legislation of the trade agreements program

(Rates of duty are percent ad valorem)								
Trade agreements acts	Maximum permissible reduction (basic authority) <sup>1/</sup>	Original tariff rate level and subsequent tariff rate levels after maximum permissible reduction						
		100.00	75.00	50.00	35.00	20.00	5.00	
Trade Agreements Act of 1934,	50 percent of rate on July 1, 1934.	50.00	37.50	25.00	17.50	10.00	2.50	
Trade Agreements Extension Act of 1945.	50 percent of rate on January 1, 1945.	25.00	18.75	12.75	8.75	5.00	1.25	
Trade Agreements Extension Act of 1955.	15 percent of rate on January 1, 1955.	21.25	15.94	10.63	7.44	4.25	1.06	
Trade Agreements Extension Act of 1958.	20 percent of rate on July 1, 1958.	17.00	12.75	8.50	5.95	3.40	0.85	
Trade Expansion Act of 1962,	50 percent of rate on July 1, 1962.	8.50	6.38	4.25	2.97	1.70	0.43	

<sup>1/</sup> Under supplemental authorities contained in the acts of 1958 and 1962, reductions greater than those shown could be made under stipulated conditions. For example, under the 1958 act duties under 10 percent ad valorem could be reduced by 2 percentage points, and under the 1962 act, duties of 5 percent or less could be totally removed.

The Bilateral Agreements Period of the  
Trade Agreements Program (1934-1947)

Before 1947, the trade negotiations conducted by the United States under the trade agreements program were only with individual foreign countries (or in one case, a customs union), and all of the trade agreements resulting from the negotiations were bilateral--i.e., between two parties. Under the trade agreements program, between 1934 and 1947 the United States concluded bilateral agreements with 29 countries: 1/ Sixteen in Latin America and 11 in Europe, plus Canada and Iran. The 29 countries, listed in the order in which the agreements initially were placed in effect, are as follows: 2/

1934: Cuba	1936: Guatemala	1941: Argentina
	Nicaragua	
1935: Belgo-Luxembourg	Finland	1942: Peru
Economic Union		
Haiti	1937: El Salvador	1943: Uruguay
Sweden	Costa Rica	Mexico
		Iceland
1936: Brazil	1938: Czechoslovakia	1944: Iran
Canada	Ecuador	
Netherlands		
Switzerland	1939: United Kingdom	1947: Paraguay
Honduras	Turkey	
Colombia	Venezuela	
France		

In terms of the value of trade between the two parties at the time of the agreement in products on which concessions were granted, the most important of the agreements were with the United Kingdom, Canada, Brazil, Argentina and Cuba.

---

1/ A bilateral agreement with the Republic of the Philippines in 1946, which is discussed later in this chapter, was not concluded under the authority of the Trade Agreements Acts.

2/ The exact effective dates and also subsequent dates of suspension or termination are given in appendix table 5-B.

The aggregate effect of the bilateral agreements  
on the U.S. average tariff level

By 1947, when the bilateral agreements period of the trade agreements program effectively came to an end, <sup>1/</sup> schedules of concessions with 27 of the original countries were still in effect. Altogether, the 27 countries accounted for 68 percent of the value of U.S. imports and received 67 percent of U.S. exports in 1939. The concessions which the United States had granted in the agreements then in force covered 69 percent of dutiable imports, had reduced the U.S. average duty level by one-third, and had bound the duty-free status of approximately 70 percent of the imports which were then on the free list. (See table 5-L).

Table 5-L.--Trade agreements in effect in 1947: U.S. imports of products on which duties had been reduced, average rates of duty before and after agreements, and average reduction in rates

(All data in this table are based on import statistics of 1939)						
Class of imports	United States imports		Average ad valorem		Average	
	for consumption		equivalent of rates		reduction	
	Value	Percent of	Preagreement	As of 1947	in rates	
	Million	total dutiable				
	dollars		Percent	Percent	Percent	
Dutiable imports, total-----	879	100.0	48.2	32.2	33	
Concession products:						
Duty reduced-----	562	63.9	57.3	32.3	44	
Duty bound at preagree-						
ment rate-----	41	4.7	17.6	17.6	-	
Products not in any						
agreement-----	276	31.4	34.3	34.3	-	
Duty-free imports-----	1,397	-	-	-	-	
Total imports, dutiable						
and free-----	1/ 2,276	-	18.6	12.4	33	

<sup>1/</sup> The duty free status of approximately 70 percent of these imports was bound in bilateral agreements in effect in 1947.

Source: U.S. Tariff Commission Operation of the Trade Agreements Program, June 1934 to April 1948, Rept. No. 160, 2nd ser., 1949. Pt. III, Trade-Agreement Concessions Granted by the United States, p. 13.

Note.--The average ad valorem equivalent rates are based on a sample of the items, covering 80 percent of the total dutiable imports in 1939.

<sup>1/</sup> Several agreements actually extended beyond 1947 and remnants of a few are still in effect, as explained in subsequent pages of this chapter. After 1947, however, no new bilateral agreements were negotiated under the trade agreements program legislation, although supplementary agreements were negotiated to the original agreements with Venezuela and Switzerland.

Based on a tabulation covering 80 percent of dutiable U.S. imports in 1939, <sup>1/</sup> the profile of U.S. tariff rates was significantly changed by the bilateral agreements. The following tabulation compares the distribution of U.S. dutiable imports according to duty levels before the agreements with the distribution under rates in effect in 1947:

Rate of duty (percent ad valorem)	<u>Estimated percent of U.S. dutiable imports covered</u>	
	<u>Before any agreement</u>	<u>As of 1947</u>
10 or less	8.8	16.2
10.1 to 20.0	15.7	20.2
20.1 to 30.0	9.1	17.2
30.1 to 40.0	13.0	18.4
40.1 to 50.0	6.1	6.1
50.1 or more	47.3	21.4

Perhaps the most notable change was in duty levels above 50 percent ad valorem. Before the agreements, approximately 47 percent of U.S. dutiable imports paid duties over 50 percent ad valorem, 30 percent paid duties above 70 percent ad valorem, and 12 percent paid duties above 90 percent ad valorem. After the agreements, only 21 percent of imports were paying duties over 50 percent ad valorem (and only about 6 percent above 70 percent ad valorem). <sup>2/</sup>

The amount of reduction in average U.S. duty levels varied considerably among the different product categories (table 5-M). The average rates on two product categories (earthenware and glassware; manufactures of silk and synthetic textiles) were reduced by only 6 percent, while the average

<sup>1/</sup> See U.S. Tariff Commission, Operation of the Trade Agreements Program, Report No. 160, second series, Part III, p. 21.

<sup>2/</sup> A frequency distribution of current U.S. tariff levels is shown on pages 29 and 84 of chapter II.

rate levels on two other categories (sugar, molasses and manufactures; spirits, wines and other beverages) were virtually cut in half.

Table 5-M.--Trade agreements in effect in 1947: Average ad valorem equivalents of rates on total dutiable U.S. imports before and after agreements and average reduction in rates, by product categories <sup>1/</sup>

(All data in this table are based on import statistics of 1939)					
Products	Dutiable imports	Ad valorem equivalent of rates		Average reduction in rates	Percent of dutiable imports on which rate reduced
		Before any agreements	As of 1947		
	\$,000 dollars	Percent	Percent	Percent	
1. Chemicals, oils, and paints-----	56,586	37.2	31.5	15	52.2
2. Earthenware, earthenware, and glassware-----	25,369	43.0	40.3	6	27.0
3. Metals and manufactures of-----	89,728	40.3	27.7	31	70.8
4. Wood and manufactures of-----	17,002	16.8	10.6	37	84.9
5. Sugar, molasses, and manufactures of-----	90,543	69.4	35.2	49	92.8
6. Tobacco and manufactures of-----	35,999	77.5	58.6	24	99.9

<sup>1/</sup> The product categories correspond to the tariff schedules originally provided for in the Tariff Act of 1930.

Source: U.S. Tariff Commission Operation of the Trade Agreements Program, June 1934 to April 1948, Rept. No. 160, 2nd ser., 1949. Pt. III, Trade-Agreement Concessions Granted by the United States, p. 37.

The portion of dutiable imports in each category on which rates were reduced also showed wide variation. For example, duties were reduced on 18 percent of imports of manufactures of silk and synthetic textiles, compared with reductions on virtually all imports of tobacco and manufactures.

By the close of the bilateral agreement period, the concessions in the bilateral agreements covered a significant part of dutiable U.S. imports from most of the partners in the agreements. The actual percentages for the 14 principal countries are shown in table 5-N, where it is seen that

for 8 of the countries, over 90 percent of their dutiable imports into the United States had undergone reductions in tariff rates in the agreements. For three countries (Cuba, Venezuela and Turkey), duties were reduced on virtually all of their dutiable shipments to the United States.

<sup>1/</sup> Duty reductions in the agreements with Cuba are applicable only to imports from Cuba and imports from other countries of commodities subject to rates reduced in the agreements with Cuba are consequently not shown in this table.

<sup>2/</sup> Less than 0.05 percent.

Source: U.S. Tariff Commission, *Operation of the Trade Agreements Program*, June 1934 to April 1948, Rept. No. 160, 2d ser., 1949, pt. III, Trade-Agreement Concessions Granted by the United States, pp. 71, 73.

Aggregate concessions obtained by the United States  
from the bilateral agreements

The commitments made by foreign partners in the bilateral agreements on their imports from the United States are summarized in table 5-0. Approximately three-fifths of their total imports from the United States were covered by some form of commitment in the agreements. Roughly one-fourth of U.S. shipments into these countries had a reduction in duty, about 18 percent had the existing duty bound against increase, about 14 percent had the existing duty-free status bound, and about 6 percent had other forms of commitments (such as commitments covering monopoly or quantitative controls, British margins of preference, and duties reduced by indeterminate amounts).

The data in table 5-0 overstate the coverage of commitments to some degree because for eight of the countries shown in the table it was not feasible to segregate statistical data on concessions made prior to the first multilateral round of negotiations under the General Agreement on Tariffs and Trade, and consequently, data for these eight countries (shown as Group 1 in the table) include the first round of concessions under the General Agreement. It is estimated, however, that the overstatement would not exceed 10 percent. When the General Agreement was initially negotiated, the United States and former U.S. bilateral agreement partners who were participating in the initial GATT negotiations transferred to their schedules of concessions under the GATT virtually all of the concessions contained in the bilateral agreements, in some cases making further reductions. For the United States, concessions on new products in the first Geneva negotiations under the GATT covered only about 10 percent of total U.S. imports.

<sup>1/</sup> Countries for which statistics cover periods other than the calendar year 1939 are as follows: Brazil--Apr. 1, 1938, to Mar. 31, 1939; Iran--Mar. 22, 1939, to Mar. 21, 1940; Newfoundland--July 1, 1938, to June 30, 1939.

Statistics of imports into Argentina, Costa Rica, Ecuador, El Salvador, Finland, Guatemala, Haiti, Honduras, Uruguay, Venezuela, and French dependencies were not available in a form suitable for tabulating, and United States statistics of exports to these countries were used as measures of the trade covered by their concessions.

<sup>2/</sup> Data for countries shown as Group 1 in the table include concessions in the first multilateral round of negotiations under the General Agreement on Tariffs and Trade. A very large part of the concessions made then covered the same products covered by prior concessions in bilateral agreements with the United States (see text).

<sup>3/</sup> Includes imports subject to commitments as to monopoly or quantitative controls, commitments of British countries as to margin of preference unaccompanied by commitments as to rate of duty, and commitments as to duties which are reduced by indeterminate amounts and as to duties which may be increased within specified limits.

<sup>4/</sup> Includes Ceylon, dependencies of France, Newfoundland and other territories covered by United Kingdom commitments, and the dependencies of Belgium and the Netherlands (except the Netherlands West Indies and Surinam, for which available import statistics do not make it feasible to identify the trade in concession items). Ceylon subscribed independently to the Geneva agreement, but its trade relations with the United States were previously covered by the trade agreement between the United States and the United Kingdom.

Source: U.S. Tariff Commission, *Operation of the Trade Agreements Program, June 1934 to April 1948*, Rept. No. 160, 2d ser., 1949, pt. IV, Trade-Agreement Concessions Obtained by the United States, p. 18.

It was not practical to attempt to calculate the amount of reduction which occurred in the individual foreign tariffs involved in these agreements as a result of concessions granted in the agreements, but it can be presumed that for each individual country it was substantially less than the overall reduction in the U.S. average duty level, because each of the 27 countries accounted for only a part of the total concessions. Assuming balanced agreements were negotiated in the first place, however, in terms of U.S. export interests alone, and setting aside other parts of the foreign tariff schedules, presumably the aggregate reductions in foreign tariffs of interest to the United States should approximate the aggregate reduction in the U.S. tariff.

Tariff concessions by foreign countries in the bilateral agreements consisted of bindings of duty-free treatment, bindings of existing rates of duty, and duty reductions ranging from comparatively small percentages up to total removal.

#### Suspension and termination of the bilateral agreements

Most bilateral trade agreements concluded by the United States under the authority of the Trade Agreements Act were to remain in force for an initial period of 3 years. Afterwards, they were automatically extended for an indefinite period, but subject to termination by either contracting party on six months' notice. Unless terminated or suspended, the agreements remained in effect irrespective of whether the legislative authority under which they had been negotiated was further extended.

After 1947, it was U.S. policy, in general, to carry on trade negotiations only in the multilateral context of the General Agreement on Tariffs

and Trade which had been negotiated during 1946-47 and entered into effect on January 1, 1948. As countries with which the United States had bilateral agreements acceded to the GATT, the bilateral agreements usually were suspended or terminated, and concessions contained in the bilateral agreement usually were carried over into the country's schedule of concessions annexed to the GATT. Under the terms of the suspension, the bilateral agreements were to remain inoperative as long as the United States and the other country were contracting parties to the General Agreement. If the United States or any of these countries should cease to be contracting parties to the General Agreement, however, the earlier bilateral agreement was to be revived.

Agreements with nine countries were suspended upon their accession to the GATT. Seven of the agreements (those with Belgium, Canada, Cuba, France, Luxembourg, the Netherlands, and the United Kingdom) were suspended in January 1948; the agreement with Brazil was suspended in July 1948, and the one with Switzerland in August 1966. Later, all of these except the agreement with Canada were completely terminated. <sup>1/</sup> Agreements with seven countries were terminated immediately or soon after the respective parties joined the GATT: Finland (1950), Haiti (1950), Sweden (1950), Peru (1951), Turkey (1952), Uruguay (1953), and Iceland (1970). When Argentina became a member of the GATT, effective October 11, 1967, the 1941 bilateral agreement with that country was amended so as to keep the agreement in effect

---

<sup>1/</sup> The termination dates were as follows: Belgium (1953), Brazil (1958), the Netherlands (1962), the United Kingdom (1962), France (1962), Cuba (1963), Luxembourg (1963), and Switzerland (1968).

until the President proclaims a consolidated schedule of U.S. concessions under the GATT. 1/

By joint agreement between the United States and the respective countries, nine U.S. bilateral agreements were terminated, in whole or in part, for reasons other than the adherence of the parties to the General Agreement. Agreements terminated in this manner, and the year in which each agreement was wholly or partly terminated, were as follows: Colombia (1949), Costa Rica (1951), El Salvador (1962), Guatemala (1955), Honduras (1961), Iran (1960), Mexico (1951), Nicaragua (1938 and 1950), Paraguay (1963), and Venezuela (1972).

The agreement with Nicaragua was terminated in 1938 with respect to its schedule of concessions and related general provisions; the other general provisions were terminated in 1950. The agreements with El Salvador, Honduras, and Paraguay were terminated with respect to the schedules of tariff concessions and the general provisions related thereto; the other general provisions in the agreements, which provide for most-favored-nation treatment, national treatment in the application of internal taxes, and the equitable administration of import policies, are still in effect. In an exchange of notes with Venezuela in June of 1972, by which most of the bilateral agreement with that country was terminated, it was agreed that the concessions on petroleum specified in the U.S. schedule to the agreement would be maintained, and the most-favored-nation principle was reaffirmed for both countries, although an exception was made in the event Venezuela should desire to enter into free trade pacts or customs unions. The other bilateral agreements listed were terminated fully.

---

1/ Such a proclamation had not been issued at the close of 1973.

On two occasions the United States took unilateral action to terminate bilateral trade agreements. The agreement with Czechoslovakia was terminated in 1939, when the German occupation of that country made it impossible for Czechoslovakia to fulfill its obligations. The U.S.-Ecuador agreement was revoked by the United States in 1956, when Ecuador established a new tariff schedule incorporating rates generally higher than those in the bilateral agreement.

During their existence, a few of the agreements were renegotiated or supplemented, some extensively. For example, the original bilateral agreement with Canada was replaced by an entirely new agreement three years later, and parts of the second agreement later were renegotiated on two occasions. A significant supplementary agreement was added to the original agreement with Cuba (in 1942), with Venezuela (in 1952), and with Switzerland (in 1955).

At the close of 1973, six bilateral agreements negotiated under the reciprocal trade agreements legislation remained in force. For three of these--El Salvador, Honduras and Paraguay--only the general provisions remain, the schedules of tariff concessions having been terminated many years ago. For one--Argentina--virtually all of the tariff concessions have been overtaken by subsequent concessions in the GATT. The fifth--with Venezuela--has been almost completely terminated, the vestiges remaining being the MFN provision and the U.S. concession on crude petroleum (which is not duplicated in the GATT).

A sixth bilateral agreement, the so-called "Exclusive bilateral agreement negotiated with Cuba, supplemental to the General Agreement on Tariffs

and Trade," is still in existence but has not been applied since February 1962. This agreement became effective January 1, 1948, when the 1934 bilateral agreement with Cuba was suspended. Its chief purpose was to continue for selected products, in an arrangement related to the General Agreement, the tariff preferences which had existed under the original bilateral agreement with Cuba. At such time as normal commercial relations are restored with Cuba, this agreement presumably will become operative again.

The Multilateral Agreement Period of the Trade Agreements Program:  
The General Agreement on Tariffs and Trade

The shift from negotiating numerous bilateral trade agreements individually to negotiating simultaneously with several countries in a multilateral context was probably a natural development from the U.S. experience under its trade agreements program from 1934 to 1946. The negotiating technique for bilateral agreements was to deal with the tariff rate on items for which the negotiating partner was a principal (usually the largest) supplier. Under the unconditional MFN policy of the United States, however, its tariff concessions were generalized to imports from all other countries, and consequently the benefits of the concessions were extended to other countries so long as they did not discriminate against U.S. trade. As more and more bilateral agreements were concluded, however, it became apparent that countries which were less important suppliers were interested in, and willing to pay for, a contractual right to the reduced rates of duty which had already been included in earlier agreements with other countries.

Aside from this past experience, there was the additional necessity in 1946 to reconstruct world trade after a devastating war. This could be done most quickly in a multilateral framework.

In response to leadership of the United States, discussions were held before the end of World War II concerning the feasibility of establishing an international organization to resolve the anticipated post-war problems

relating to foreign exchange, investment, and trade. 1/ Following the Bretton Woods Conference in July 1944, the International Monetary Fund and the International Bank for Reconstruction and Development were created. Pending the creation of a third body, an International Trade Organization (ITO), which was intended to function as a United Nations agency for the expansion of world trade and employment, the General Agreement on Tariffs and Trade (GATT) was negotiated in September 1947 as a temporary measure. The plans for the ITO, however, eventually were abandoned, and the GATT became the primary instrument for international trade cooperation. 2/

Tariff concessions under the General Agreement on Tariffs and Trade

The General Agreement on Tariffs and Trade is a multilateral international trade agreement currently adhered to by most of the important trading nations of the world. The GATT is accepted (or applied on a de facto basis) by 99 countries whose foreign trade amounts to more than 80 percent of total world trade. Table 5-P lists the GATT contracting parties and dates of accession.

---

1/ A brief history of efforts by the allied countries to prepare for anticipated post-war problems, including discussions of an Atlantic Charter, the lend-lease programs, the establishment of the International Monetary Fund and the International Bank for Reconstruction and Development, and proposed a charter for an International Trade Organization, appear in the U.S. Tariff Commission report, Operation of the Trade Agreements Program, Part II, Report No. 160, U.S. Government Printing Office, 1949, pp. 16-20.

2/ A new organization in the international trade field--the United Nations Conference on Trade and Development (UNCTAD)--was established on Dec. 30, 1964, (U.N. Resolution 1995 XIX/), as a permanent organ of the General Assembly of the United Nations. Organized, in part, because of a desire among developing countries for a comprehensive trade organization, UNCTAD was to promote international trade, especially with a view to accelerating the economic development of the less-developed countries.

Countries which have acceded provisionally: Tunisia, Philippines

Countries to whose territories the GATT has been applied and which now, as independent States, maintain a de facto application of the GATT pending final decisions as to their future commercial policy

Algeria	Khmer Republic	Southern Yemen
Bahrain	Lesotho	Swaziland
Botswana	Maldives	Tonga
Equatorial Guinea	Mali	Zambia
Fiji	Qatar	

The General Agreement is probably the most comprehensive commercial agreement ever concluded among sovereign nations. Its objectives are to encourage freer trade and nondiscriminatory trade practices through the observance of an extensive set of rules designed to promote the expansion of world trade. The rules principally proscribe the use of quantitative restrictions and discriminatory trade practices by the contracting parties

(except under specified conditions, such as for the correction of critical balance of payments problems).

Article II of the General Agreement provides that "each contracting party shall accord to the commerce of the other contracting parties treatment no less favorable than that provided for in the appropriate...schedule annexed to this agreement." The "appropriate schedule annexed to this agreement" specifies the detailed tariff and other concessions which a particular country has made under the agreement. When most countries have acceded to the GATT they have annexed to the agreement a schedule of specific tariff concessions which becomes a part of the agreement. <sup>1/</sup>

In Article XXVIII bis of the General Agreement, "the contracting parties recognize...negotiations on a reciprocal and mutually advantageous basis, directed to the substantial reduction of the general level of tariffs...are of great importance to the expansion of international trade. The Contracting Parties may therefore sponsor such negotiations from time to time." Six general rounds of multilateral negotiations have taken place between the GATT Contracting Parties, and a seventh round is just beginning. In addition numerous smaller negotiations have been conducted, the most important of which was the negotiation on the accession of Japan. As new concessions are negotiated by a country, they are added to that country's schedule to the agreement.

---

<sup>1/</sup> The only countries which have not yet annexed schedules of specific concessions are newly independent developing nations which have acceded to the GATT under a special resolution of the Contracting Parties.

The first round (Geneva, 1947)

At the close of World War II, in November 1945, the United States proposed to other governments that an international conference on trade and employment be convened to consider the establishment of an international trade organization of the United Nations and to negotiate reciprocal reductions in tariffs. In February 1946, on the motion of the United States, the United Nations Economic and Social Council undertook to sponsor the proposed international conference and established a Preparatory Committee which was to arrange for the conference. At the Committee's first session in London in 1946, it adopted a resolution recommending to the governments concerned that the tariff negotiations proposed by the United States be held under the sponsorship of the Preparatory Committee as a part of its second session. It also recommended procedures for carrying through the negotiations in such a way as to give effect to certain provisions of the charter for an international trade organization, which the Committee was developing, by means of a general agreement on tariffs and trade among the members of the Committee. These recommendations were accepted and negotiations were conducted in Geneva, Switzerland, from April to October of 1947 as part of the second session of the Preparatory Committee for the United Nations Conference on Trade and Employment. The results of these tariff negotiations were the General Agreement on Tariffs and Trade.

Twenty-three countries 1/ participated in these negotiations, each appending to the General Agreement a schedule of tariff concessions. The

---

1/ Australia, the Belgian-Netherlands-Luxembourg Customs Union, Brazil, Burma, Canada, Ceylon, Chile, China, Cuba, Czechoslovakia, France, India, the Customs Union of Lebanon and Syria, New Zealand, Norway, Pakistan, Southern Rhodesia, the Union of South Africa, the United Kingdom, and the United States.

U.S. schedule annexed to this agreement listed concessions on products for which total imports in 1939 (the "base year" used for statistics for the negotiations) were valued at \$1,766 million, or 78 percent of total U.S. imports. The concessions consisted of the following:

- (1) Binding of the duty-free status of products valued at \$1,130 million, which was half of total U.S. imports in 1939 and about 83 percent of duty-free imports;
- (2) binding of the existing rates of duty on imports valued at \$148 million, or about 6.5 percent of total imports and 16.8 percent of dutiable imports;
- (3) duty reductions by varying amounts ranging up to 50 percent on imports valued at \$471 million, or 20.7 percent of total imports and 53.6 percent of dutiable imports.

About 85 percent of the U.S. imports which were bound free of duty had previously been bound in bilateral trade agreements; new bindings were made on duty-free imports valued at approximately \$165 million. Similarly, 68 percent of the imports on which existing duties were bound had been included in earlier bilateral agreements; new bindings of existing rates covered \$48 million in imports. Thus, subtracting concessions which were being transferred from existing bilateral agreements into the General Agreement, the new concessions negotiated in the first round under the GATT actually covered \$533 million of U.S. imports, which was 23 percent of total U.S. entries in 1939. The new concessions made by the United States amounted to an average duty reduction on U.S. dutiable imports of 21 percent.

Commitments were made by other countries negotiating at Geneva in 1947 on their tariff provisions which covered imports from the United States valued at approximately \$1.3 billion. For 23 percent of this trade, the concession was a binding of the duty-free status; and for 28 percent of the trade, the concession was a binding of the existing duty. Duty reductions were made on 38 percent of the trade, and other forms of commitments (such as binding the margin of preference, monopoly purchase commitments, etc.) covered 11 percent of the trade. As in the case of the U.S. schedule of concessions for this first GATT round, a significant part of duty-free bindings and bindings of existing rates by foreign countries represented transfers from earlier bilateral agreements with the United States and were not new concessions.

The foreign duty reductions covered almost \$500 million of U.S. imports in 1939. On 16 percent of this trade the duty was totally removed; for 10 percent reductions greater than 50 percent (but short of total removal) were made. Thirty-two percent of the imports underwent duty reductions of 25-35 percent; 20 percent underwent cuts of 36-50 percent; and 20 percent had cuts of less than 25 percent. Imports into Canada and the United Kingdom accounted for three-fourths of U.S. export trade on which duties were reduced in the 1947 Geneva negotiations (see table 5-Q).

Table 5-Q.--Imports (mainly in 1939 <sup>1/</sup>) from the United States into foreign countries negotiating in the first GATT round at Geneva in 1947, by kinds of scheduled concessions made at the negotiations

<sup>1/</sup> Countries for which statistics cover periods other than the calendar year 1939 are as follows: Australia--July 1, 1938, to June 30, 1939; Brazil--April 1, 1938, to March 31, 1939; Czechoslovakia--1937; India-Pakistan--April 1, 1938, to March 31, 1939; Newfoundland--July 1, 1938, to June 30, 1939; Syro-Lebanese Customs Union--1938.

Statistics of imports into French dependencies were not available in a form suitable for tabulating and United States statistics of export to these countries were used as measures of trade covered by their concessions.

<sup>2/</sup> Includes imports subject to commitments as to monopoly or quantitative controls, commitments of British countries as to margin of preference/unaccompanied by commitments as to rate of duty, and commitments as to duties which are reduced by indeterminate amounts and as to duties which may be increased within specified limits.

<sup>3/</sup> In the 1939 agreement between the United States and the United Kingdom, the United Kingdom concessions included bindings and reductions of the margins of tariff preference to be afforded British goods imported into some of the dependent territories of the United Kingdom. In the Geneva agreement imports from the United States into the territories, other than the metropolitan area of the United Kingdom and Newfoundland, covered by the United Kingdom commitments are subject only to the general commitment that preferential treatment is not to be introduced on commodities where such treatment was not previously provided for, and that existing margins of British preference are not to be increased. Thus, all imports into the dependent territories of the United Kingdom above referred to may be regarded as subject to binding with respect to margins of British preference. No account is taken in this tabulation of reductions in the margins of preference provided for in the 1939 agreement.

<sup>4/</sup> Includes the Netherlands East Indies and the Belgian Congo but not the Netherlands West Indies or Surinam. The statistics available for the latter territories are not such as to make it feasible to identify the trade in concession items.

Source: U.S. Tariff Commission, Operation of the Trade Agreements Program, June 1934 to April 1948, Rept. No. 160, 2nd ser., 1949. Pt. IV, Trade-Agreement Concessions Obtained by the United States, p. 18.

The elimination of British Commonwealth preferences on imports of several agricultural products into the United Kingdom, Canada, Australia and New Zealand, and the significant reduction in the margin of preference on a number of additional agricultural products imported into those countries was considered one of the important concessions obtained by the United States.

#### The second round (Annecy, 1949)

In 1949, 21 of the original 23 contracting parties to the General Agreement convened in Annecy, France, to negotiate tariff concessions with 10 countries which were applying for accession to the agreement. <sup>1/</sup> The United States had previously negotiated bilateral agreements with five of the acceding countries (Finland, Haiti, Nicaragua, Sweden, and Uruguay).

The value of U.S. imports in 1948 from all sources on which concessions were granted at Annecy was \$250 million. Imports of items on which concessions were directly negotiated with the acceding countries were valued at \$143 million. Duties were reduced on \$60.9 million of this trade, existing duties were bound on \$4.2 million, and the duty-free status was bound on \$77.9 million. In addition, each acceding country benefited indirectly from some concessions negotiated with the United States by other acceding countries; U.S. imports from the 10 acceding countries in this category were valued at \$24 million. U.S. 1948 imports of the combined direct and indirect benefits to the acceding countries totaled \$167 million, or about 44 percent of total imports from those countries in that

---

<sup>1/</sup> The ten new applicants were: Denmark, the Dominican Republic, Finland, Greece, Haiti, Italy, Liberia, Nicaragua, Sweden, and Uruguay.

year. As in the initial GATT negotiations in 1947, some of the U.S. duty-free bindings had already been made in bilateral agreements with the countries negotiating for accession at Annecy.

U.S. exports of products on which concessions were received to the countries with which the concessions were negotiated totaled \$489 million. It was estimated at the time that an additional \$100 million of U.S. exports would benefit from concessions negotiated between other countries participating in the conference.

### The third round (Torquay, 1950-51)

In 1950, 27 of the 32 contracting parties to the General Agreement met in Torquay, England, along with seven countries acceding to the GATT (including Uruguay, which had participated in the Annecy negotiations but had not completed the necessary steps for accession). Agreements were reached between the United States and five of the acceding countries (Austria, Federal Republic of Germany, Korea, Peru, and Turkey). Successful negotiations were also completed with 12 countries which were already contracting parties. <sup>1/</sup>

U.S. MFN imports of items upon which concessions were made at Torquay totaled \$477 million from all sources. Of this \$477 million, \$84 million resulted directly from agreements with the five acceding countries, and \$182 million from new agreements with countries which had been contracting parties to the GATT at the beginning of the negotiations. For 88 percent of the trade under U.S. concessions duties were reduced; 5 percent had

---

<sup>1/</sup> These countries were the Benelux Union, Brazil, Canada, Denmark, Dominican Republic, France, Indonesia, Italy, Norway, and Sweden.

existing duties bound, and 7 percent had existing duty-free treatment bound. Among the negotiations concluded by the United States, the agreements with Canada and West Germany were the most important from the standpoint of trade.

Concessions granted directly to the United States by the other participants covered \$1,058 million of 1949 imports from the United States by the 17 countries with which the United States completed negotiations. It was estimated that over \$100 million of additional U.S. exports would benefit from concessions negotiated between other countries participating in the conference.

The life of concessions granted in the earlier Annecy and Geneva conferences were extended beyond the 3-year period initially agreed upon, after satisfactory adjustment. Concessions obtained by the United States at Annecy and Geneva covering an estimated \$100 million were modified or withdrawn, but compensatory concessions covering an estimated \$105 million of U.S. exports were obtained in exchange.

#### Japanese accession to the GATT (1955)

In 1955, Japan acceded to membership in the GATT, with tariff concessions exchanged principally through bilateral negotiations with 17 countries. <sup>1/</sup> Japan also received certain additional concessions from six of these countries in exchange for concessions granted by the United States to these countries.

---

<sup>1/</sup> The 17 countries were Burma, Canada, Chile, Denmark, Dominican Republic, Finland, Indonesia, Italy, Nicaragua, Norway, Pakistan, Peru, Germany, Greece, Sweden, United States, and Uruguay.

Total concessions granted by the United States covered \$179 million (75 percent from Japan) of 1954 U.S. imports. Duty reductions covered \$81 million of U.S. imports, bindings of existing duties covered \$53 million, and bindings of duty-free treatment covered \$45 million. For the \$131 million of U.S. imports of concession items from Japan, duty reductions affected \$59 million of imports, duty bindings affected \$32 million, and free bindings covered \$40 million.

In exchange for concessions granted by the United States, Japan granted concessions on imports from the United States covering \$397 million of trade in 1953. Of this total, \$61 million consisted of duty reductions, \$140 million of duty bindings, and \$195 million of duty-free bindings. Out of these total Japanese concessions, concessions covering \$1.2 million of imports from the United States were granted in return for U.S. concessions to third countries for additional third country concessions on \$2 million of Japanese exports. Most U.S. concessions to third countries designed to increase Japanese exports were negotiated directly between the United States and Japan. However, such triangular concessions covering about \$3 million of U.S. imports were initially negotiated between the United States and third countries. The United States also obtained some indirect benefits when third countries granted concessions to Japan on products which the United States also sells.

#### The fourth round (Geneva, 1956)

In 1956, 22 of the 35 contracting parties to the GATT undertook tariff negotiations in Geneva, Switzerland. <sup>1/</sup> In these negotiations, the High Authority of the European Coal and Steel Community acted on behalf of France, Italy, and Germany concerning iron and steel products.

The United States granted concessions (including compensation for increases in earlier bound U.S. duties) on a total of \$911 million of its 1954 imports from all sources, \$811 million of which came from participants in the negotiations. Excluding duty reductions on copper (duties on copper at that time actually were suspended) U.S. imports of concession items from all sources totaled \$753 million. Except for one free binding and reductions on 36 items to a rate of 50 percent ad valorem, concessions consisted almost entirely of 15 percent duty reductions.

Concessions for United States exports were obtained directly in negotiations with the participating 21 countries, covering imports from the United States valued at \$398 million in 1954. The United States also received indirect benefits from approximately 60 other negotiations between pairs of countries.

#### The fifth (Dillon) round (Geneva, 1960-62)

From 1960-62, 35 contracting parties to the GATT, plus 5 countries (Cambodia, Israel, Portugal, Switzerland, and Spain) negotiating for full accession to the General Agreement met at Geneva for the fifth major round

---

<sup>1/</sup> The 22 countries were Australia, Austria, Belgium, Canada, Chile, Cuba, Denmark, Dominican Republic, Finland, France, Federal Republic of Germany, Haiti, Italy, Japan, Luxembourg, Netherlands, Norway, Peru, Sweden, Turkey, the United Kingdom, and the United States.

of tariff negotiations. The members of the European Economic Community negotiated at this conference for the first time as a unit.

In the first phase of the conference, renegotiation of some of the earlier concessions made under the GATT were undertaken. In this phase, the United States relinquished rights to old concessions of individual European Community member states covering \$1,488 million of U.S. exports (\$900 million bound directly to the United States) in exchange for new concessions by the Community as a bloc of \$1,677 (\$1,583 million bound directly to the United States). In other renegotiations, the United States received concessions worth \$144.6 million in exchange for withdrawn concessions worth \$178 million of U.S. exports. The United States withdrew concessions worth \$86.2 million of U.S. imports in exchange for new concessions worth \$30.2 million of U.S. imports.

The fifth round of negotiations for new tariff concessions, known as the Dillon round, opened on May 29, 1961. During this second phase of the 1960-62 negotiations, the United States concluded negotiations with 19 contracting parties to the GATT, 1/ three parties preparing to become full contracting parties (Cambodia, Israel, and Portugal), and one provisional contracting party (Switzerland). Most concessions granted by the United States were rate reductions of 20 percent, from 1958 levels, but some rates were reduced by 2 percentage points, while others were reduced to a rate equivalent to 50 percent ad valorem. The 1960 value of U.S. imports of products on which concessions were granted was \$1.2 billion from countries of initial negotiation and \$1.8 billion from all sources.

---

1/ Austria, Canada, Denmark, Finland, Haiti, India, Japan, New Zealand, Norway, Pakistan, Peru, Sweden, United Kingdom, and the European Community.

Direct tariff concessions for U.S. exports (mostly 20 percent duty reductions) were valued at \$1.6 billion.

The sixth (Kennedy) round (1964-67)

The sixth round of multilateral negotiations, referred to as the Kennedy round, was by far the largest which has been held thus far. Forty-six countries completed the negotiations, which were conducted in Geneva, Switzerland from May 1964 to June 1967. At the time, it was estimated that the aggregate tariff concessions negotiated at the conference would benefit world trade valued at about \$40 billion annually.

When the GATT Contracting Parties decided in 1963 to conduct a new round of comprehensive trade negotiations, they adopted a resolution which stated: "That, in view of the limited results obtained in recent years from item-by-item negotiations, the tariff negotiations...shall be based upon a plan of substantial linear tariff reduction with a bare minimum of exceptions...The linear reductions shall be equal." <sup>1/</sup> A Trade Negotiations Committee (TNC), established to develop the plan for the negotiations, was to deal, inter alia, with the problem for certain countries "with a special economic or trade structure such that equal linear tariff reductions may not provide an adequate balance of advantages."

At the beginning of the negotiations in 1964, the TNC agreed that a 50 percent cut would be used as the general rule for a linear reduction but that the ultimate agreement on tariff reductions in accordance with this general rule depended upon the solution of other problems (such as

---

<sup>1/</sup> A "linear" tariff reduction is one in which a fixed percentage reduction is applied across the board to all tariff rates.

tariff disparities, agricultural problems, exceptions to the general rule, and nontariff problems) and, in general, with the achievement of reciprocity. The TNC also decided at that time that Canada, Australia, New Zealand and South Africa fell in the category of countries with a "special economic or trade structure" (additional countries were to be added to this category later).

In the conference, fifteen countries negotiated on the basis of linear offers on industrial products, but on the basis of specific offers on agricultural products; 14 participated as "special arrangement" countries, negotiating entirely on an item-by-item basis because of their special economic or trade structure or other economic consideration; and 17 participated under arrangements for less-developed countries. <sup>1/</sup> During the conference six countries (Argentina, Iceland, Ireland, South Korea, Poland and Yugoslavia) completed negotiations for accession to the General Agreement. The United Arab Republic negotiated for accession, but the negotiations were not completed when the conference ended.

<sup>1/</sup> The participating countries which completed the negotiations are listed below. The United States negotiated with all countries listed, except Czechoslovakia and Malawi and all of the negotiations were completed, except the one with Australia.

<u>"Linear"</u> <u>countries</u>	<u>"Special</u> <u>arrangement"</u> <u>countries</u>	<u>"Less-developed"</u> <u>countries</u>
Austria	Australia	Argentina
Denmark	Canada	Brazil
European Community:	Czechoslovakia	Ceylon
Belgium	Greece	Chile
Netherlands	Iceland	Dominican Republic
Luxembourg	Ireland	India
France	Israel	Indonesia
Germany	New Zealand	Jamaica
Italy	Poland	South Korea
Finland	Portugal	Malawi
Japan	South Africa	Nicaragua
Norway	Spain	Nigeria
Sweden	Turkey	Pakistan
Switzerland	Yugoslavia	Peru
United Kingdom		Sierra Leone
United States		Trinidad and Tobago
		Uruguay

Concessions granted by the United States at the Kennedy round covered U.S. imports in 1964 valued at \$8.5 billion. 1/ Of this total, duties were reduced for \$7.9 billion; existing duties were bound for \$150 million; and duty-free treatment was bound for \$400 million. U.S. imports of concession items from major countries (other linear countries plus Canada) totaled \$6.7 billion, of which 6.4 billion had existing duties reduced (or in a few cases totally removed), \$89 million had existing duties bound, and \$240 million had existing free status bound.

Concessions made by all other participants covered 1964 imports from the United States valued at \$8.1 billion. Concessions by the other major participants covered \$7.6 billion of imports from the United States, with duties reduced (or in some cases eliminated) on \$6.7 billion of the total, existing rates bound on \$68 million, and duty-free treatment bound on \$845 million.

Using 1964 import data, and applying the final stage of Kennedy round concession rates, calculations by the Tariff Commission at the end of the negotiations indicated that the U.S. concessions had reduced the average level of U.S. import duties by 27.6 percent (see table 5-R). On agricultural products alone, however, the reduction was only 11.4 percent, 2/

---

1/ Total U.S. imports in 1964 were valued (f.o.b.) at \$18.6 billion, of which \$11.6 billion was dutiable and \$7 billion was free. The \$8.5 billion figure for U.S. concessions is an estimated c.i.f. value for U.S. imports reported in official statistics (on an f.o.b. basis) as \$7.6 billion. The upward adjustment was used during the negotiations to provide comparability with c.i.f. values used for imports by other countries.

2/ This smaller reduction in agricultural products was the result of the general unwillingness of other countries to reduce duties (and other hinderances to trade) in the agricultural area.

Table 5-R.--Commodity groups: Calculated duty reductions made in the Kennedy Round and actual average duty levels in 1964 and 1972 compared

Commodity group	Average duty in 1964 (Actual)	Estimated post Kennedy Round average duty 1/	Percent reduction in Kennedy Round	Average duty in 1972 (Actual)	Percent reduction: 1964-72 (+ = in- crease)	Dutiable net MFN imports 2/

1/ Estimated made by calculating duties which would have been collected on 1964 imports, using the final stage of post-Kennedy Round rates.

2/ "Net imports" are imports on which MFN duties were actually paid (i.e., dutiable products entered free under special situations, such as for government use, are excluded.)

3/ Imports increased substantially in TBUS items having higher than average rates.

4/ The unit price of imported tobacco decreased from \$5.00 per lb. in 1964 to \$3.00 per lb. in 1972. The specific rate on tobacco therefore had a higher ad valorem equivalent in 1972.

5/ A large volume of dutiable lumber imports in 1964 had specific rates of duty with very low ad valorem equivalents (0.1 percent to 1.6 percent). These items became duty-free in the Kennedy Round and substantial increases in other dutiable products with higher rates occurred in 1972.

6/ In 1964, part of this category was subject to escape-clause rates of duty. The reduction in duty was calculated on the basis of the continuance of escape-clause rates and taking into consideration only "new" concessions made in the Kennedy Round. If the reduction had been calculated on the basis of the Kennedy Round cuts plus removal of the escape-clause rates, the estimated post-Kennedy Round rate would have been 36.2 percent ad valorem instead of the 49.8 percent shown.

The 1972 average duty reflects removal of escape-clause rates (i.e., restoration of the former concessions). In addition, in 1972, there was a substantial increase in imports of items for which duties were cut in the Kennedy Round by 50 percent (from \$18 million to \$75 million). The unit price of watches and watch movements also increased significantly between 1964 and 1972, further lowering the ad valorem equivalent of the specific rates applicable to watches.

Source: Calculations made by the U.S. Tariff Commission, using official statistics of the U.S. Department of Commerce.

whereas for industrial products alone it was 30.6 percent (or 32.5 percent without petroleum, which was excepted from U.S. concessions). These calculations represent own-trade-weighted average duties, using 1964 trade as weights. 1/

Using a somewhat different system of weighting than was used in the above calculations, average Kennedy round reductions in the industrial sector (excluding mineral fuels) have been calculated by one writer on the subject as follows: United States, 36 percent; European Community, 37 percent; United Kingdom, 39 percent; and Japan, 39 percent. 2/

U.S. trade coverage and the depth of tariff cut for Kennedy round concessions by the major participants in these negotiations is given (in terms of 1964 imports, which was the year used at the conclusion of the negotiations) in table 5-S for industrial products and 5-T for agricultural products. The trade values in these two tables are converted

---

1/ Table 5-R also provides an illustration of one of the problems in averaging tariffs and comparing tariff averages over time. Applying pre- and post-Kennedy-round duties to 1964 imports indicated an average reduction of 27.6 percent in the U.S. tariff level. By 1972, however, when the final stage of Kennedy round rates became effective, the composition of U.S. imports had changed so that the actual average duty level in 1972 was only 21.9 percent below the actual level of 1964. This would seem to indicate that the reduction in high duties (which were still higher than the average) had stimulated imports to enter under the reduced, but higher than average, rates.

2/ See Ernest H. Preeg, Traders and Diplomats, The Brookings Institute, Washington, D.C., 1970. Such calculations were not made for Canada because of the absence of the necessary data.

in tables 5-U, and 5-V into the percentages of each country's imports available for concession on which concessions were granted. <sup>1/</sup> Trade "available for concessions" in the negotiations consisted of duty-free imports not already bound free in the GATT plus all dutiable imports.

Tables 5-S, 5-T, 5-U and 5-V illustrate one aspect of the extreme difficulty encountered in arriving at a suitable method for measuring reciprocity in large multilateral negotiations. As mentioned earlier, the Kennedy round negotiations lowered the average industrial tariff levels of most of the major participants by approximately the same percentages. The figures in the four tables show, however, that in terms of U.S. bilateral

---

<sup>1/</sup> The data from which these four tables have been compiled were prepared at the conclusion of the negotiations and assumed implementation of the Supplemental Agreement Relating Principally to Chemicals (the "ASP agreement"), which called for the removal of the U.S. system of valuing benzenoid chemicals for duty purposes on the basis of the selling price of competitive U.S. products in return (very generally speaking) for the full linear cut in European and United Kingdom chemical duties (if the U.S. ASP system were not removed, only a 20 percent cut was to be made in European Community and United Kingdom duties). This supplemental agreement was not implemented, and consequently, the depth of cut trade data in the four tables is slightly (but not significantly) overstated in the case of the United States, the European Community and the United Kingdom.

U.S. dutiable imports of benzenoid chemicals in 1964 were valued at \$53 million, or less than 1 percent of total U.S. imports undergoing concessions in the Kennedy round. Total dutiable chemical imports from the United States by the European Community and the United Kingdom were valued at \$465 million and \$170 million respectively.

Failure to implement the ASP package was, of course, significant for the chemical sector. If the ASP package had been implemented, U.S. weighted average duties for chemicals would have been 7.3 percent (in place of 8.0 percent), European Community duties would have been 6.8 percent (in place of 10 percent), and the United Kingdom duties would have been 8.6 percent (in place of 13.1 percent).

For details of the Kennedy round negotiations in the Chemical sector, see pages 173-176 of the Special Trade Representative's "Report on United States Negotiations, 1964-1967 Trade Conference," volume 1.

NA - Not available.

\* Imports already bound duty-free in the GATT, and thus not subject to concessions, accounted for a large percentage of total imports.

1/ Trade data are 1964 MFN imports by the respective countries. Not all of a country's total MFN imports were available for concessions in the Kennedy round, as each country had numerous duty-free items already bound in the GATT. An asterisk indicates product groups where such bound-free imports account for a large percentage of total imports.

2/ Estimated, exact data not available.

3/ Total for all European Free Trade Association (EFTA) countries; separate data are not available for United Kingdom. EFTA countries in 1964 were United Kingdom, Norway, Sweden, Denmark, Austria, Finland, Switzerland, and Portugal. (Iceland did not become a member of EFTA until 1970.)

4/ Grains (principally wheat) were not included among tariff concessions at the Kennedy round but were the subject of an accord reached during those negotiations on the basic provisions of a new World Grains Arrangement. The accord provided for minimum and maximum prices for wheat and for a multilateral food aid program. Imports of grains from the United States covered by the Arrangement were as follows (in millions): By the European Community, \$252; by Canada, \$32.7; by the United Kingdom, \$151.5; and by Japan, \$290.

5/ Figures are for trade with United States only.

6/ Total trade in sugars and confectionery by Canada, and linear countries other than the United States was about \$840 million in 1964.

7/ Concessions by the major trading countries, half of which were U.S. concessions, covered imports of \$67 million.

8/ No reductions were made in MFN duties. The United Kingdom was to reduce margins of preference on \$115 million of tobacco and tobacco products, dependent upon the United States elimination of the American selling price system of valuation. This was not done.

9/ Excludes value of supplemental package negotiated on chemicals for the elimination of American selling price system of valuation.

Source: Abstracted from parts 3 and 4 of Report on Negotiations, General Agreement on Tariffs and Trade, 1964-67 Trade Conference Geneva, Switzerland, prepared by the Office of the Special Representative for Trade Negotiations.

trade with major partners, the patterns of concessions which were made varied widely in terms of depth of tariff cut and trade coverage.

The trade coverage of concessions of the principal participants, by product group, is shown in table 5-W. From that table it is seen that, in general, concessions were made on smaller percentages of the trade in agricultural products than in industrial products. Also, it can be noted that in the industrial area, the percent of trade covered by concessions varied considerably from one product group to another, as well as from country to country for a single product group. For some groups, such as furniture, concessions were made on virtually all trade; for others, only a relatively small part of trade was covered.

#### Summary comparison of the six GATT rounds

A statistical comparison of the results of the six GATT rounds of tariff negotiations, in terms of U.S. trade on which concessions were granted, is presented in table 5-X, which is taken from an earlier Tariff Commission report. <sup>1/</sup> In comparing one round with another, the following factors should be kept in mind: (1) The volume of total imports at the time of the various rounds, (2) the division of imports between free and dutiable, (3) the percent of total imports covered by concessions, (4) the percent of dutiable imports covered by duty reductions, and (5) the reduction made in the average tariff level.

By these criteria, the first, fifth (Dillon), and sixth (Kennedy) rounds of negotiations were the most significant; the second, third, and fourth rounds were relatively unimportant. At the first round, concessions

1/ The data presented in this table are from the indicated sources. No attempt has been made to reconcile differences.

2/ "Trade year" represents the year of the trade statistics used for calculating reciprocity.

3/ U.S. Tariff Commission, "Value of U.S. Imports for Consumption . . . , 1930-67," February 1968.

4/ With the exception of the entries for 1939 and 1964, the figures are taken from U.S. Department of Commerce, Foreign Commerce and Navigation of the United States, 1946-1963, table 1. The 1939 figure is taken from the annual publication of the same source for 1939. The 1964 figure is taken from the U.S. Statistical Abstract, 1965, table 1238.

5/ There is a lack of parallelism in the presentation of concessions granted and received. The former are cited in terms of the value of trade in the product from all sources; the latter in trade with negotiating countries only.

6/ Sources are listed by round.

First: U.S. Department of State, Analysis of General Agreement on Tariffs and Trade, 1947, concessions granted, p. 134; concessions received, p. 4.

Second: U.S. Tariff Commission, Operation of the Trade Agreements Program, 3d report, concessions granted, p. 7; concessions received, p. 9.

Third: U.S. Tariff Commission, Operation of the Trade Agreements Program, 4th report, concessions granted, p. 8; concessions received, p. 8.

Fourth: U.S. Tariff Commission, Operation of the Trade Agreements Program, 9th report, concessions granted, p. 61 (by contrast, U.S. Department of State, General Agreement on Tariffs and Trade, Analysis of United States Negotiations, 1956, refers to \$811 concessions granted, pp. 1-2, the difference from the U.S. Tariff Commission figure being explained by the difference in the size of concessions directly negotiated, State using \$677 and the Tariff Commission \$519). For concessions received, the previous sources, U.S. Tariff Commission, p. 63 and Department of State, p. 5.

Fifth: U.S. Department of State, General Agreement on Tariffs and Trade, Analysis of United States Negotiations, 1960-1961 Tariff Conference, concessions granted, vol. 1, p. 198. U.S. Tariff Commission, Operation of the Trade Agreements Program, 14th report, concessions received, p. 22. (By contrast, the above cited Department of State publication uses the figure \$1,496 for concessions received, p. 106.)

Sixth: Office of the Special Representative for Trade Negotiations, General Agreement on Tariffs and Trade, 1964-67 Trade Conference, Report on United States Negotiations, vol. 1, pt. 1, concessions granted, p. iii; concessions obtained, p. iv.

7/ The concession on copper has been excluded from these figures. If copper is included the figure becomes \$911. Cf. U.S. Tariff Commission, Operation of the Trade Agreements Program, 9th report, p. 60.

Source: U.S. Tariff Commission, Operation of the Trade Agreements Program, 19th report, p. 238.

granted by the United States covered 77 percent of total U.S. imports, but a large part of these were actually transferrals from bilateral agreements into the GATT without change. New concessions at the first round covered 23 percent of total imports and about 54 percent of dutiable imports. The new concessions amounted to an average duty reduction on U.S. dutiable imports of 21 percent. At that time, only 38 percent of U.S. imports were dutiable.

The Dillon round covered about 12 percent of imports, and although most concessions were rate reductions of 20 percent, the total effect of the reductions on the U.S. average tariff level was estimated to be less than 4 percent.

At the Kennedy round, duty reductions were granted on 64 percent of U.S. dutiable imports at a time when dutiable imports accounted for 62 percent of total imports; total concessions (including bindings) covered 46 percent of total U.S. imports. At the time of the sixth round, dutiable trade was far more significant in U.S. imports than at the time of the first round. The Kennedy round concessions reduced the average level of U.S. duties existing prior to the negotiations by approximately one-third.

In terms of trade coverage (both in absolute values and relative to total and dutiable imports) it can be said that the Kennedy Round was by far the most significant of the six rounds. However, the negotiation of the general provisions of the GATT at the first round should not be overlooked as a major accomplishment of possibly greater long-run significance than the new tariff concessions which were negotiated at that time.

## Agreements Outside the Trade Agreements Program

Since the inception of the trade agreements program, the United States has entered into four international agreements which dealt with tariff rates, but which were outside the regular trade agreements program.<sup>1/</sup> These were the U.S.-Canadian Automotive Products Agreement, a bilateral trade agreement with the Republic of the Philippines, and the so-called Beirut and Florence Agreements.<sup>2/</sup>

The U.S.-Canadian Automotive Products Agreement

In January 1965, the United States and Canada entered into an agreement providing for the total removal of duties on trade between the two countries in automotive products. Article I of the agreement states three objectives: (1) The creation of a broader market for automotive products within which the full benefits of specialization and large-scale production can be achieved; (2) the liberalization of United States and Canadian automotive trade in respect of tariff barriers and other factors tending to impede it, with a view to enabling the industries of both countries to participate on a fair and equitable basis in the expanding total market of the two countries; and (3) the development of conditions in which market forces may operate effectively to attain the most economic pattern of investment, production and trade.

---

<sup>1/</sup> The agreements were implemented by special acts of Congress, rather than under the tariff reduction authority granted to the President in the Trade Agreements Acts.

<sup>2/</sup> The Beirut Agreement (negotiated at Beirut, Lebanon) is entitled "Agreement for Facilitating the International Circulation of Visual and Auditory Materials of an Educational, Scientific and Cultural Character." The Florence Agreement (negotiated at Florence, Italy) is entitled "Agreement on the Importation of Educational, Scientific and Cultural Materials."

Canada implemented the agreement with respect to its imports on a most-favored-nation basis, extending the duty-free treatment of automotive products covered by the agreement to Canadian imports from all countries. The United States, however, confined the removal of duties to Canadian products, and it was therefore necessary to obtain a waiver of the unconditional MFN obligation contained in Article I of the General Agreement on Tariffs and Trade.

There are some differences in the definition of articles which are given duty-free treatment by Canada and by the United States. In both directions, only parts for use as original equipment by manufacturers of automobiles receive duty-free treatment. As for vehicles, those imported into the United States from Canada may be imported duty free by any person, whereas those imported into Canada from the United States may be imported duty free only by Canadian manufacturers of automobiles. 1/

The Agreement has resulted in a large increase of trade in automotive products in both directions. In 1964, the year before the agreement became effective, total automotive trade between the two countries (excluding tires and tubes, which are not covered by the agreement) amounted to \$705 million. In 1972, trade in products covered by the agreement totaled \$9,018 million. In 1964, the United States had a surplus of approximately \$563 million in its automotive products trade with Canada; in 1972, the United States ran a deficit of approximately \$128 million in trade in products covered by the agreement. 2/

---

1/ For the specific product coverage of the agreement, see "Canadian Automobile Agreement, Seventh Annual Report of the President to the Congress on the Operation of the Automotive Products Trade Act of 1965," Committee on Finance, United States Senate.

2/ Idem. See also other annual reports of the President on operation of the agreement for a discussion of statistical problems in tabulating trade under the agreement, as well as some problems which have attended the operation of the agreement.

Bilateral agreement with the Philippine Republic

The U.S. Tariff Act of 1909 and the Philippine Tariff Act of the same year established reciprocal free trade between the Philippines and the United States (with a few exceptions, which subsequently were omitted in later U.S. tariff acts). Trade relations with the Philippines continued on substantially the same tariff basis until 1934, when Congress passed several laws which substantially modified them. One of these laws was the Philippine Independence Act, under which free trade between the two countries was to continue for the first 5 years of the "Commonwealth period," (1935-1940) except that limitations were placed upon the maximum amounts of sugar, coconut oil, and cordage which would be permitted to enter the United States duty free. Any shipments in excess of the quotas were to be assessed the full U.S. duties. During the second 5 years of the Commonwealth, the Philippines were obliged to assess progressively increasing export taxes against all exports to the United States which were not admissible into the United States duty free when imported from other countries.

No provision was made in the Independence Act for permitting or requiring the curtailment of imports of U.S. goods into the Philippines during the Commonwealth period, and the Philippines held no legal power to restrict their imports of U.S. goods during this period by means of quotas or tariffs.

Philippine independence was to be attained, under provisions of the Act, on July 4, 1946, at which time the full United States duties were to be collected on all Philippine goods arriving in the United States; and the full Philippine duties were to be collected on all U.S. goods arriving

in the Philippines. When the Philippines became independent in 1946, however, a bilateral trade agreement between the United States and the new Republic of the Philippines provided for a period of reciprocal duty-free treatment relating to U.S.-Philippine trade which would terminate on July 3, 1954, and during the subsequent 20-year period the rates of the United States and Philippine duties were to be gradually increased until July 4, 1974, when all tariff preferences were to have been eliminated and full duties applied by each country.

At a later suggestion of the Philippine Government, the period of reciprocal duty-free treatment was extended for 18 months until the close of 1955, pending discussions of a modification of the original 1946 agreement. A revision of the 1946 agreement was completed in September 1955.

The 1946 agreement called for duties on U.S. imports of Philippine articles and duties on Philippine imports of U.S. articles to be levied at 5 percent of the lowest duty rates (the Cuban rate in the case of U.S. duties) applicable to imports from other countries during the period July 4, 1954, through December 31, 1954. Each calendar year thereafter the rates on U.S. and Philippine articles were to be raised 5 percent until duties on such articles reached 100 percent of the lowest rates on January 1, 1973. They were to remain at this level until July 1, 1974, when all preferences would be eliminated.

The revised agreement negotiated in 1955 provided for a less rapid imposition of U.S. duties on imports from the Philippines and an acceleration of Philippine duties on imports from the United States. The schedule

of declining tariff preferences provided in the revised agreement is set forth below, the figures representing percent of the lowest tariff rate applicable to imports from other countries.

	<u>U.S. rate on Philippine articles (percent)</u>	<u>Philippine rate on U.S. articles (percent)</u>
1956-58-----	5 -----	25 -----
1959-61-----	10 -----	50 -----
1962-64-----	20 -----	75 -----
1965-67-----	40 -----	90 -----
1968-70-----	60 -----	90 -----
1971-73-----	80 -----	90 -----
1974 (Jan. 1 - July 3) <u>1/--</u>	100 -----	100 -----

In the agreement, absolute quotas were also imposed on U.S. imports of a few Philippine products (under the 1955 revision, sugar, cordage, cigars, tobacco, coconut oil, and pearl or shell buttons).

The era of U.S.-Philippine tariff preferences ended for most products at the close of 1973, and will terminate completely on July 4, 1974, after which date trade between the two countries will be conducted entirely on a most-favored-nation basis. The Philippine Republic provisionally acceded to the General Agreement on Tariffs and Trade on August 9, 1973.

Over the past 10 years, U.S.-Philippine trade has increased as follows (in millions of dollars):

	<u>U.S. imports from the Philippines</u>			<u>U.S. exports to the Philippines</u>
	<u>Total</u>	<u>Free</u>	<u>Dutiable</u>	
1963-----	344	80	264	320
1972-----	496	99	397	359

1/ All but a small number of Philippine products imported into the United States became subject to the full MFN rate of duty on January 1, 1974. For a few products, however, the rate rose only to the level of the preferential "Cuban" rate, and will reach the full MFN rate on July 4, 1974.

### The Beirut and Florence Agreements

The United States is a party to two agreements which provide for the duty-free importation of educational, scientific and cultural materials. Both agreements were negotiated under the sponsorship of the United Nations Educational, Scientific, and Cultural Organization (UNESCO).

In an agreement initially negotiated at Beirut, Lebanon, in 1948 and opened for signature at Lake Success, New York, in July 1949, duty-free treatment is provided for specified types of visual and auditory materials of an educational, scientific or cultural character. The purpose of the agreement is to facilitate the international circulation of such material so that "the free flow of ideas by word and image will be promoted and the mutual understanding of peoples thereby encouraged." The Beirut Agreement was not signed by the United States until October 1966; it entered into force for the United States on January 12, 1967. Twenty-seven countries 1/ are parties to the agreement. U.S. imports in 1972 of articles covered by the agreement totaled \$3 million.

In an agreement negotiated initially at Beirut in 1948, completed at Florence, Italy, in 1950, and opened for signature at Lake Success in November 1950, duty-free treatment is provided for books, publications, documents, and specified educational, scientific and cultural materials. The purpose of this agreement is to further "the free exchange of ideas and knowledge and, in general, the widest possible dissemination of the

1/ Parties to the Beirut Agreement are: Brazil, Canada, Congo (Brazzaville), Costa Rica, Cyprus, Denmark, El Salvador, Ghana, Greece, Haiti, Iran, Iraq, Jordan, Khmer Republic, Lebanon, Madagascar, Malawi, Malta, Morocco, Niger, Norway, Pakistan, Philippines, Syrian Arab Republic, Trinidad and Tobago, the United States, and Yugoslavia.

diverse forms of self expression used by civilizations" in order to promote "intellectual progress and international understanding, and the maintenance of world peace." The Florence Agreement was not implemented by the United States until November 1966. Seventy-two countries 1/were parties to the agreement in 1973. When the United States signed the Florence Agreement in 1966, some of the items covered by the agreement were already free of duty in the U.S. tariff schedules and their duty-free status had been bound under the GATT. Products which were dutiable and became free, however, had a total value in 1965 U.S. imports of \$40 million, and an estimated value of approximately \$216 million in 1972 imports. The principal items which had been dutiable were books, and paintings and drawings which were not originals.

## U.S. Trade with Trade-Agreement Partners

In concluding this examination of the nature and extent of tariff concessions made in U.S. trade agreements, it would be useful to look briefly at the pattern of trade with areas of the world according to their trade-agreement relationship. From table 5-Y, it is seen that 98.2 percent of U.S. exports go to most-favored-nation countries and 99.3 percent of U.S. imports come from those countries. Eighty-five percent of this MFN trade is with GATT countries, 15 percent with non-GATT countries. Considering dutiable imports only, U.S. imports from GATT countries paid an average duty in 1972 of 8 percent, while imports from non-GATT MFN countries paid an average duty of 11.1 percent. The small dutiable imports from non-MFN countries paid an average duty of 15.4 percent.

Sixty-nine percent of U.S. exports go to developed countries, but 73 percent of imports come from those countries. U.S. dutiable imports from developed countries paid an average duty of 7.7 percent; whereas dutiable shipments from developing countries were assessed an average duty of 11 percent. Dutiable shipments from African countries had the lowest U.S. average duty level, 4.6 percent; shipments from Asian countries had the highest average duty, 10.8 percent.

Table 5-Z shows U.S. imports and the average level of U.S. duties on dutiable imports for individual GATT countries and for selected non-GATT countries receiving MFN tariff treatment. The most striking observation from this table is the considerable range in the average duty levels on imports from different countries. Dutiable shipments from some countries have average tariffs in the neighborhood of 3 percent, while imports from others pay average duties of over 30 percent.

Table 5-Y.--U.S. trade and average incidence of U.S. duties, by specified areas and groups of countries in 1972

(In billion dollars)						
Area or group	: U.S. : : exports :	: U.S. imports :			: Average : level of : U.S. import : duties <u>1/</u>

1/ Calculated on dutiable imports only. The average level of duties would be somewhat lower if calculated on total free and dutiable imports.

2/ Pursuant to section 401 of the Tariff Classification Act of 1962, to section 231 or 257(e)(2) of the Trade Expansion Act of 1962, or to action taken by the President thereunder, the United States does not extend MFN tariff treatment to imports from Cuba, Czechoslovakia and Romania even though these countries are contracting parties to the GATT.

3/ Tunisia has acceded to the GATT provisionally while the other countries listed have been former territories to which the GATT has been applied and which now, as independent States, maintain a de facto application of the GATT pending final decisions as to their future commercial policy.

4/ Trade data for Fiji and Tonga are included in other Pacific Islands, n.e.c.

5/ Trade data for the Maldives are included in Southern and Southeastern Asia, which includes Bhutan, Burundi and Portuguese Timor plus the Maldives.

Note.--The ratio of duties collected to the value of imports (sometimes referred to as the "average ad valorem equivalent") should be used with great reservation as a measure of the "height" of a country's tariff or of the tariff's restrictiveness of imports. Such a ratio for the schedule of duties as a whole (or even a ratio for most individual tariff categories) is heavily weighted by imports that enter either free of duty or at low unrestrictive rates; it is weighted less by imports that enter at high restrictive rates and not at all by imports that are precluded from entry. Moreover, an upward or downward trend in the "ratio" of duties collected may reflect alterations in the rates of duty applied, changes in the composition of imports from year to year, or changes in the prices of imported commodities.

Appendix table 5-B.--U.S. bilateral trade agreements negotiated between 1934 and 1947 under the Trade Agreements Act of 1934, as amended and extended

Authority and country	Date effective	Date terminated, suspended or superseded

Paraguay-----	4-9-47	6-26-63 <sup>3/</sup>

<sup>1/</sup> The original Cuba bilateral agreement was superseded January 1, 1948, when both countries acceded to the GATT. A new and exclusive bilateral agreement with Cuba supplementing the GATT became effective.

<sup>2/</sup> Suspended as long as both countries are contracting parties to the GATT.

<sup>3/</sup> Terminated in part. The schedule of concessions and related provisions were terminated on date indicated, while the remaining provisions relating to most-favored-nation treatment, national treatment in the application of internal taxes, and the administration of import policies on an equitable basis are still in effect.

<sup>4/</sup> Duty concessions and certain other provisions were terminated March 10, 1938.

<sup>5/</sup> Terminated in part, June 30, 1972. In an exchange of notes on June 26, 1972 it was agreed that tariffs specified for petroleum in the U.S. schedule to the agreement should be maintained and the most-favored-nation principle was reaffirmed, although an exception is made in the event Venezuela should desire to enter into free trade pacts or customs unions.

<sup>6/</sup> Argentina acceded to the GATT, effective October 11, 1967. For all practical purposes the trade agreement between the United States and Argentina is inoperative so long as both countries are members of the GATT.

## Chapter VI

# NONTARIFF TRADE BARRIERS: A RESUMÉ

### Introduction

In preparing this report on tariff and nontariff barriers, the Commission has taken as a working definition of nontariff barriers any governmental or private regulation, practice, or policy, other than an ordinary customs duty, that interferes with a normal conduct of trade and tends to distort the volume, composition or direction of trade flows.

The most obvious nontariff barriers are such measures as quotas, which are imposed specifically to control trade. There are other trade distorting measures which are normally imposed to deal with matters not related to trade, but are occasionally intentionally employed for trade-restrictive purposes; and still other measures which are applied exclusively for non-trade-related reasons but which have an unavoidable adverse effect on trade.

The very great increase in public attention given to nontariff trade barriers during the past few years has led many to believe that they are recent innovations being installed in rapidly increasing numbers by governments around the world. Only the term is relatively new to popular usage, however, and there is little, if any, evidence that nontariff trade barriers are more prevalent today than one or two decades ago. In fact, if an inventory could be made of barriers in existence 20 or 25 years ago, it probably would reveal them to be considerably more numerous at that time.

Several developments have contributed to this increased public awareness and attention. First is the enormous increase in world trade, which has brought an ever increasing number of businessmen dealing in an

increasing number of products into contact for the first time with numerous laws, regulations and practices which hinder the freedom they would like to have in conducting their business. A second important development has been that over the past 25 years most tariffs in the major trading nations have been progressively reduced and are now at relatively moderate levels, with the result that other types of limitations or controls upon trade appear more important than they did when the high tariff was the major and frequently impossible obstacle to overcome. Finally, on the part of both governments and private individuals there is an emerging appreciation of the fact that the long term trend in market economy countries toward direct government participation in, and regulation of, more and more areas of economic and social activity means a vast increase in situations which, in the absence of appropriate attention, could become major barriers to trade.

## Nontariff Trade Barriers Reported in the Commission's Survey

The practices reported to the Tariff Commission as nontariff trade barriers have been classified under 47 general headings, which in turn have been grouped into six large categories. The six categories and their subheadings are shown in the following table.

Table 6-A.--Categories of nontariff trade barriers used in this report

# Complaints, by category and type

The total number of complaints in each of the six categories is given in table 6-B. Slightly more than one-third of the complaints received by the Commission dealt with quantitative restrictions and other specific limitations on trade; 29 percent concerned nontariff charges on imports; and government participation in trade, standards and labeling requirements and customs procedures and administrative practices each drew between 11 and 12 percent. Discriminatory shipping practices were the subject of about 1 percent of the total complaints.

Note.--Complaints against discriminatory shipping practices are omitted from this table because most did not specify a country. Sixty-one complaints were received in this category.

The 47 subheadings of the six categories are listed in table 6-C in the order of the number of complaints received under each subheading.

	:		:

1/ The nontariff charges described by respondents in the Commission's survey as "border taxes" usually referred only to value-added taxes, turnover (cascade) taxes, and a very limited number of other consumption taxes levied on imports upon entry. However, under the customary definition, most of the taxes reported under the following headings listed in this table are also considered border tax adjustments:

1. Nondiscriminatory use and excise taxes and registration fees;
2. Nondiscriminatory sales taxes;
3. Discriminatory excise taxes, film taxes, use taxes, and commodity taxes;
4. Discriminatory sales taxes; and
5. Miscellaneous special and additional taxes and fees.

Source: Compiled from submissions to the Tariff Commission.

Countries named in complaints

All industrialized nations and over 50 developing countries were named in complaints submitted to the Commission against nontariff trade barriers. Although less than one-third of U.S. exports go to the developing countries, half of the complaints concerned practices of those countries. As might be expected, the pattern of complaints against developed and developing countries differed, as illustrated below:

	Percent of complaints against --	
	<u>Developed countries</u>	<u>Developing countries</u>
Quantitative restrictions and similar specific limitations on trade-----	28.6	42.5
Nontariff charges on imports-----	24.1	34.7
Government participation in trade----	17.4	6.7
Standards or labeling requirements----	17.8	5.0
Customs procedures and practices-----	12.1	11.1

The number and categories of complaints against individual countries are shown in table 6-D. The total of complaints against the European Community and its member states greatly outnumbered those received by any individual country. The ten individual countries most frequently named were:

United States	United Kingdom
Japan	Brazil
Mexico	Spain
France	Argentina
Italy	West Germany

1/ Includes complaints against the European Community without specifying a country.

2/ With respect to development status, Portugal is a "borderline" country, but usually is considered to be a "developing" country. Portugal is listed here among developed countries only because of membership in EFTA.

3/ Includes complaints against EFTA without specifying a country.

4/ Includes Poland and complaints against developed countries without specifying a country.

5/ Excludes Poland.

Source: Compiled from submissions to the Tariff Commission.

Note: Due to rounding, percents may not add to totals shown.

Complaints, by sector

For this report, industrial products have been classified into 23 sectors and agricultural products into 9 sectors (see Part III). Respondents in the Commission's survey named in their complaints some products in all 32 of the sectors.

The number and categories of complaints in each of the sectors is shown in table 6-E. Over half of the complaints were in one-fourth of the sectors. The eight sectors drawing the largest number of complaints were:

- Transport equipment
- Chemicals
- Nonelectrical machinery
- Electrical machines and apparatus
- Ores, metals, and metal manufactures
- Beverages and spirits
- Foodstuffs
- Textiles.

The remainder of this chapter is a summarization of the principal non-tariff barriers. These are discussed in greater detail in Part II of this report.

Quantitative Restrictions and Similar Specific  
Limitations on Trade 1/

Quantitative import and export restrictions, the most obvious and easily identifiable nontariff barriers to trade, appear in three basic elemental forms: Embargoes, where trade is prohibited; absolute quotas, where a specified maximum amount of trade is permitted in a given period; or licensing systems, under which administrative officials have discretionary authority to permit trade. Other indirect, more sophisticated and subtle quantitative restrictions include: Exchange controls, where foreign exchange to pay for imports is limited and allocated by kind, quantity, and source of goods; local content and mixing regulations, where specified amounts of local products are required with consumption of a unit of a foreign product; minimum or maximum price controls, permitting trade only above or below stipulated prices; restrictive business practices, under which cartels or similar arrangements control market access; and discriminatory bilateral agreements, where two countries agree to purchase specified amounts of given products from each other before purchases are made from third countries.

The restrictive effects of these controls can vary considerably. Absolute quotas may exceed the level of imports which will enter under existing market conditions or may be extremely restrictive; licensing systems can be "automatic," "liberal" or exceedingly restrictive. Several quantitative restrictions may be applied together, such as a quota and exchange controls, or a quota administered through licensing. Licensing used to administer quotas may restrict imports at announced levels, control

---

1/ See chapter VIII for a detailed discussion of quantitative trade restrictions.

trade at levels not publicly announced (discretionary controls), or enforce regulations such as sanitary requirements. Even where licensing is "automatic" it is an objectionable barrier to trade because of the uncertainty it creates, the possibilities of delays and discrimination in granting of licenses, and the additional documentation costs. The impact which quantitative restrictions can have on world trade has been demonstrated on a grand scale just recently by the embargo on oil exports by producing countries in Africa and the Middle East.

Quantitative limitations have generally been considered by economists as the most objectionable of all trade barriers. Other methods of limiting trade, such as tariffs, are said to be preferable because they still leave open to consumers the possibility of choosing an imported product (admittedly at a higher cost) and to foreign producers the possibility of improving their position by lowering their own prices. Nevertheless, other restrictions, such as variable levies, government procurement practices, certain industrial standards, or a prohibitive tariff are often equally as successful as quantitative restrictions in quashing trade.

Historically, the United States opposed quantitative restrictions on trade and used the device very little against U.S. imports until the world depression of the 1930's. After World War II, the United States supported the movement away from trade barriers through the General Agreement on Tariffs and Trade (GATT). Although the GATT prohibited the use of quantitative restrictions against imports, there were important exceptions to the prohibition, notably in the case of a country experiencing balance of payments difficulties. Quantitative restrictions continued to be widely applied until the late 1950's and early 1960's when developed countries

began to eliminate many of the restrictions imposed during and immediately after World War II.

Although there are numerous exceptions to the GATT prohibition on quantitative restrictions, the United States has persistently worked through the GATT to reduce remaining quantitative restrictions maintained by its principal trading partners. By the late 1960's a relatively small list of products (mostly agricultural) remained under quantitative restriction in these countries. In some instances, however, "voluntary" export restraints (which are not controlled by GATT regulations) have been used instead of quantitative restrictions on imports. Countries compelled to apply export restrictions argue that the country to which their exports are limited is unfairly relieved of obligations which would ensue if the country had imposed quantitative restrictions on imports, but the restrictive effect of voluntary export restraints is exactly the same as import quotas.

#### Trade complaints against quantitative restrictions

Quantitative restrictions were the target of nearly one-third of all complaints against trade barriers submitted to the Tariff Commission in the present investigation, and the three basic elemental forms drew two-thirds of the complaints in this area. Twenty-eight percent of the complaints against quantitative restrictions concerned licensing requirements; embargoes and quotas each received about 20 percent of the complaints; and 10 percent were against exchange and monetary controls. Almost 60 percent of the complaints were against quantitative restrictions in developing countries, slightly less than 40 percent were against developed nations, and a few were against countries of the Eastern Trading Area.

U.S. quantitative restrictions drew more complaints than those of any other single nation, but less than the total of complaints against either the European Community or EFTA countries. Over 60 percent of the complaints were against developing nations. Complaints against developed countries primarily concerned quotas, while licensing practices were the object of most of the complaints against LDC's.

The pattern of actual restrictions contrasted sharply with the distribution of complaints received by the Commission. For example, the countries of the European Community represent about half of the counted restrictions but received only 27 percent of the complaints. The United States and Japan, on the other hand, each had about 5 percent of the restrictions, but accounted for about one-fifth (each) of the complaints. About 80 percent of the complaints were in the industrial sector; only 20 percent concerned agricultural products, where some of the more significant restrictions are found.

#### Consumer costs of quantitative restrictions

Economists and others have devised various estimates of the cost to consumers of quota restrictions on trade (including voluntary export restraints), usually as a theoretical determination of the gross additional amount consumers must pay in a given period because of the increase in prices resulting from limitations on supply. Costs borne by consumers through increased prices due to quantitative restrictions are said to be more burdensome in other countries than in the United States because of the lesser relative importance of foreign trade in the U.S. economy. Various estimates of the costs to the U.S. consumer of U.S. quantitative restrictions have been made, the estimates showing at least several billion dollars of net gains in U.S. welfare if quantitative restrictions were

lifted and a projected increase of nearly \$37 billion in U.S. net welfare over a 15 year period if U.S. quantitative restrictions in place in 1972 were eliminated.

Patterns of quantitative restrictions of the  
major trading countries

The Tariff Commission did not attempt an analysis of the trade and price effects of quantitative restrictions, but attempted to measure the frequency of occurrence and general importance of quantitative restrictions applied by the major trading countries. Restrictions in effect in 1970-71 were counted and crudely weighted according to the burdensome nature of a particular restriction (e.g., heavier weights for quotas than for automatic licensing). Chapter VIII presents various analyses of the ranking of use and importance of quantitative restrictions.

Conclusions reached from an analysis of quantitative restrictions in 16 major trading countries indicate that France exhibits the heaviest use of such measures, followed by (in this order) Italy, the United States, West Germany, the United Kingdom, Japan, Netherlands, Belgium-Luxembourg, Canada, Austria, Norway, Portugal, Switzerland, Denmark, Ireland, Sweden, and Australia. The study indicated that among the countries, quantitative restrictions tend to be found on similar products. When the restriction count is weighted by the level of trade, the high concentration of quantitative restrictions in agricultural products is apparent, as well as their heavy use in certain industrial areas by some countries (such as France and Italy). The six product sectors having the heaviest concentrations of quantitative restrictions are foodstuffs; coal, petroleum, and natural gas; animals and animal products; grains; beverages and spirits; and textiles. These sectors account for 70 percent of the total trade-weighted restrictions.

A few countries (e.g., France, Italy, Norway, and Sweden) tend to use quantitative restrictions to complement tariffs, but evidence generally indicates that such restrictions do not substitute for tariffs on a broad product sector basis. A comparison of quantitative restrictions across countries for product sectors revealed that countries tend, broadly speaking, to protect the same products with tariffs, and also to apply quantitative restrictions to the same products.

"Voluntary export restraints" and other export controls

"Voluntary export restraints" are a 20th century innovation in non-tariff barriers. The effect of "voluntary" export restraints is similar to that of a quota for the country which was to receive the exports, but the exporting nation cannot exercise rights of compensation which would be permitted under the GATT if the importing country had imposed the equivalent restrictions on its imports. Many countries have used this device to limit imports from other countries. Japan, which has exercised "voluntary" export controls on numerous products, including steel and textiles shipped to the United States, claims that it was forced into such action by the threat of more stringent protectionist action in the United States. The advantage to the exporting country of such controls is that it can distribute the impact of decreased exports among its producers, and that it may be able to more easily bring about the end of such controls than it could in the case of restrictions imposed by the importing country. European Countries, the United States and Canada have used "voluntary restraint" agreements to limit exports from the major producers of textiles since the 1950's.

Textiles.--Controls on trade in cotton textiles were established among 30 countries under the Long-Term Arrangement Regarding International Trade in Cotton Textiles (LTA). The LTA, promoted by the United States and sponsored under GATT, became effective in 1962. The agreement allowed importing countries experiencing domestic market disruption to request exporting countries to limit shipments of cotton textiles, or impose import quotas if such requests are not granted. The LTA also provided for bilateral agreements to control trade between countries, a device that has been used by the United States increasingly in recent years.

Numerous textile restraints have also been imposed by Canada, Australia, and European countries, largely directed against exports by Asian textile producers but also against other countries. Many of these restrictions (often pre-dating the establishment of the LTA) were incorporated into the machinery of the LTA, but some are broader than U.S. restrictions, covering manmade fibers and wool as well as cotton textiles.

There was an enormous increase in U.S. importation of manmade fiber textiles, probably resulting from U.S. restrictions on cotton textiles. As a result of pressure from the industry, the U.S. Government obtained agreements with Hong Kong, Korea, Taiwan, Japan, and Malaysia in 1970 and 1971 to control wool and manmade fiber products in a manner similar to that existing for cotton textiles. These five countries accounted for over half of U.S. imports of wool and manmade fiber products in 1971.

The LTA for cotton textiles expired on December 31, 1973, at which time it was subsumed by a multifiber "Arrangement Regarding International Trade in Textiles." The new agreement contains many of the provisions which the LTA had for cotton, but extends the coverage to wool and manmade

fibers. It also establishes an international "Surveillance Body" to supervise its implementation.

It has been estimated that restraints on trade in textiles and apparel annually cost the American consumer \$1 billion.

Steel.--Rapidly increasing U.S. steel imports during the 1960's led the United States to conclude agreements with Japan, the United Kingdom and the European Community to "voluntarily" restrain steel mill product exports to the United States.

Other "voluntary restraints".--In addition to the widely publicized export controls on textiles and steel, lesser known controls have been exercised for some time by Japan over a wide range of goods exported to many countries. During the past few years, some 25 items, other than textiles and steel, have been subject to quantity and price controls when exported by Japan to the United States. These items accounted in 1970 for about 9 percent of Japanese shipments to the United States. Several dozen items have been subject to such controls if shipped to other countries.

The avowed purposes of the Japanese controls are to maintain orderly shipments or orderly marketing. However, they are more often a means of preventing erection of more onerous trade barriers by the importing countries. Japan contends that no other country must enforce "voluntary" restrictions over so many export items. However, "voluntary" restraints apparently are considered preferable to other alternatives.

In 1964, the Meat Import Act set up quotas for U.S. imports of meat of cattle, sheep (except lamb), and goats, with the quota varying directly with U.S. production. In 1968, "voluntary" export restraints were set up, with the burden of the restraint falling upon Australia and New Zealand,

the two major suppliers. In 1972 the quotas, applying to 14 countries, were suspended by the President for the balance of the year to counteract rising meat prices, and have been suspended continuously since then.

In recent years, Mexican exports of strawberries and tomatoes to the United States have been "voluntarily" restrained. In 1968, an agreement was made with Taiwan to limit exports of canned mushrooms to the United States. Efforts have been made to reinstitute a similar agreement with both Taiwan and the Republic of Korea. The International Coffee Agreement, originally set up in 1962, established export quotas to stabilize prices. The program was administered by the International Coffee Organization. The United States and other importing countries which are members of the organization control imports from both member and nonmember countries.

Exports are sometimes controlled for military or strategic reasons, or to conserve domestic supplies, or for political purposes. The United States has employed major restrictions on its export trade with the Communist countries for over 20 years. Japan, the United States, and NATO countries (except Iceland) have had multilateral controls on exports of "strategic" items to Communist countries since 1950. Support for such controls among U.S. allies gradually eroded and the United States began moves to liberalize trade with Communist countries in 1969, culminating in 1972, with liberalization of U.S. trade with the Peoples Republic of China. Several countries have restricted exports of products in short supply. The recent limitations on oil exports from the Middle East have had worldwide attention.

Exchange controls and other monetary and  
financial barriers to trade

The term, "financial barriers to trade," refers to restrictions on international movement of payments for goods and services or for the use of financial capital. These restrictions, found principally in developing countries, limit the flow of real goods and services by slowing the flow of trade in a manner similar to tariffs and other nontariff barriers. Common examples of such financial barriers are foreign exchange controls and other regulations on the method and time of payment for imports. Even though manipulations of exchange rates for balance of payments purposes generally are accepted as complying with the rules set up by the International Monetary Fund, exporters consider them to be financial barriers to trade. Many developing countries, such as Brazil, use or have used different rates of exchange for different products (effectively a form of protection).

Another common type of financial barrier, again used particularly by developing countries, is the prior import deposit, which is discussed in chapter VII dealing with nontariff charges on imports.

The Japanese payments system, involving import licensing and apparently a hangover from the time when Japan was in a deficit position in its balance of payments, has been criticized by numerous complainants. The United Kingdom used extensive restrictions on foreign exchange during the devaluation of the pound in 1967.

Financial barriers to trade are sometimes allowed by rules of the IMF and the GATT, and they are sometimes an integral part of a general protection system and domestic economic policy. Thus it is difficult to study them

in isolation. Chapter VIII discusses problems in international exchange rates and IMF rules governing exchange rates and attempts to give an indication of the level of financial restraint and the ease of financial payments flows from various countries. In general, payments from developed countries tend to be fairly prompt, while payments from developing countries tend to be delayed. Countries with balance of payments difficulties tend to have slower payments. Taking into account balance of payments difficulties, Brazil, Venezuela, and to a lesser extent Japan seem to have poorer payments records than warranted by their balance of payments positions. This could be a weak indication that financial restrictions on the outpayment of dollars to the United States might have been stronger than needed by these three countries, given their general financial situations. Generally, there seems to be linkage between balance of payments difficulties, poor international credit ratings, and financial barriers to trade.

#### Restrictive business practices

Restrictive business practices are practices engaged in by one or more private or public commercial enterprises, or by any combination, agreement, or other arrangement between such enterprises, that restrain competition, limit access to markets, or foster monopolistic control. Where such enterprises possess effective control of trade among countries, the restrictive business practices involved constitute barriers to trade. While governments have been eliminating official barriers to trade, there has been little control or attention focused on trade barriers created by private organizations. Although in 1960, the Contracting Parties to the GATT recommended bilateral or multilateral negotiations to limit restrictive business practices on the petition to one contracting party by another, the procedure

does not seem to have been used. The Treaty of Rome and the Stockholm Convention, respectively establishing the European Community and the European Free Trade Area, contain rules to control restrictive business practices.

Cartels, in which independent business organizations combine to restrain competition, are largely illegal in the United States, whereas in Europe they are permitted and sometimes encouraged. U.S. antitrust laws make the dominance over an industry illegal, while European law tends to make illegal only the misuse of a dominant position, not the dominance itself. European governments and Common Market policy permit and in some cases encourage agreements which tend to rationalize production and regularize markets.

Major types of cartels are: Import cartels, which collectively limit the total amount of specified imported goods, determining the sources of supply and/or fixing the prices and terms of purchase; rebate cartels, which discourage purchases from sources outside the cartel by granting rebates on the purchase price; patent pools, where companies share patent rights and divide markets among participants in the pool; and export cartels, by which competing firms agree to fix export prices or conditions of sale, establish quotas for export, or allocate export markets. Import cartels, rebate cartels, and patent pools are illegal in the United States, but allowed to exist in Europe.

Export cartels are legal in the United States and a number of such cartels exist. In many countries, export cartels are tolerated more freely than other types of cartels. Japanese export cartels are most prominent in textiles, but also exist for chemicals and chemical products as well as in almost all industry groupings.

In addition to national cartels, there are several international cartels, especially prominent in Western Europe (where they were apparently sanctioned or encouraged by both national governments and the European Community). Such cartels account for a sizeable share of international trade in a wide range of raw materials and manufactured products.

A more recent evolution of restrictive business practices is the rapid growth of multinational corporations, with affiliates largely controlled by U.S. parent companies. Although there are indications that multinational corporations may be, on balance, favorable for world trade, in many instances they are alleged to restrain competition in international markets and have a distortive effect on international trade.

In addition to cartels and multinational corporations, large single firms, such as the Nippon Telephone and Telegraph Company in Japan can restrain trade through dominant purchasing power. Another restrictive business practice is the common governmental requirement that transport be carried in national ships and planes. Other restrictive practices include policies of labor unions, which are claimed to exert pressure on importers to cancel orders.

#### Discriminatory bilateral agreements

Bilateral trade agreements between countries granting special trade privileges to each other discriminate against third countries through such devices as preferential financial arrangements or commitments to purchase prescribed amounts of specified commodities from the bilateral partner before purchases are made from third countries. About three-fifths of the complaints received by the Tariff Commission against discriminatory bilateral agreements were against less developed countries, and the

remainder were equally divided between centrally planned and developed market economy countries (all of the latter were European countries). Such complaints against European countries dealt primarily with discriminatory bilateral agreements with either former colonies or with centrally planned economies.

Discriminatory sourcing is one type of bilateral arrangement which favors specific countries as sources of certain imports. The usual case with this barrier is that a developed exporting country imposes on a developing country the obligation to buy its products as a condition for financial aid, or by offering the products on extremely favorable terms. Such arrangements, which distort commercial choice in international trade, are used in the foreign economic assistance programs of all major countries, including the United States, Canada, and Japan. State trading organizations also commonly exhibit a bias in the sources of their purchases. In other cases, such as French trade with its former African colonies, long-standing trade patterns or cultural ties override economic considerations in choosing the source of imports.

Nontariff Charges on Imports 1/

In most countries, imports must pay a variety of charges in addition to a customs duty. These may be collected at the border, or later in the distribution channel (e.g., at the point of consumption or as the product is being used). Some charges, such as European variable levies, are protective devices used to restrict imports, while others, such as U.S. excise taxes or the tax on value added in Europe, are collected to equalize tax treatment of imported goods with that of domestic output. Some charges such as port taxes are levied in payment for services, while others cover fees for sanitary inspections or the cost of compilation of statistical data on trade. Sometimes import "surcharges" are levied by a country with a serious balance of payments deficit.

Nontariff charges on imports were second only to quantitative restrictions in the number of complaints received in the Tariff Commission's survey of trade barriers. This is perhaps because, like quantitative restrictions, the charges are more highly visible and directly restrictive than many trade barriers. Almost one-fifth of the complaints were against charges, such as sales taxes, use taxes, etc., which generally do not discriminate between imported and domestic products, and several of the complaints were against charges, such as statistical taxes and stamp taxes, which are customarily nominal. Among the charges that were clearly identified as to type, the most frequently mentioned, by far, were the various forms of border tax adjustments, followed by port, statistical and similar entry taxes.

---

1/ See chapter VII for a detailed discussion of nontariff charges on imports.

About 85 percent of complaints concerned industrial products, and about 15 percent the agricultural area; a division almost identical with the distribution of U.S. trade. By far the largest area of industrial complaint was in the transport sector (two-fifths of complaints), largely concerning automobiles. In number of complaints, no other industrial area approached the importance of transport equipment, but chemicals; nonelectrical machinery; ores, metals and manufactures; electrical machines and apparatus; and photographic and cinematographic supplies were prominent in the complaints.

Of the nine agricultural sectors, the largest area of complaint was in beverages and spirits (one third of complaints), with most of the other sectors receiving roughly equivalent percentages of complaints.

#### Variable levies

Variable levies are charges on imports in lieu of or in addition to normal customs duties. The levies vary far more frequently than normal customs duties, sometimes daily, and are intended to diminish or eliminate any comparative economic advantage of imports in relation to domestic goods. The most frequent use of variable levies has been to raise the cost of imports to stipulated minimum prices, probably most commonly in connection with domestic agricultural support programs. Variable levies (often with other names, such as "special customs duty") are often collected under laws or regulations other than a country's customs law, and are frequently claimed by the countries applying them not to be customs tariffs and thus not subject to the same treatment in trade negotiations as customs tariffs.

Variable levies have risen to great prominence in the past decade because the European Community made the variable levy an essential element

in its Common Agricultural Policy (CAP). The variable levy thus affects a large segment of world trade and is probably the most important single measure adversely affecting U.S. exports. Variable levies exclude imports from price competition with domestic products just as do import quotas. Some shippers find the variable levy more onerous than import quotas because of the uncertainty for traders caused by the frequent changes in rates and consequent changes in the amounts of imports which are able to enter.

Variable levies are found in several countries outside the European Community, including Austria, Denmark, Finland, Greece, Portugal, Spain, Sweden, Switzerland, and the United Kingdom. In 1971, U.S. agricultural exports to these countries (accounting for over 35 percent of total U.S. agricultural exports in 1971) increased by 9 percent over 1966 levels, while exports to other countries increased by 13 percent.

Variable levies in the European Community.--Under the European Community's Common Agricultural Policy (CAP), the Community has chosen to maintain farm incomes through price supports instead of domestic income supplements. Support prices under the CAP have frequently been set substantially above world market prices, necessitating a control on imports. The variable levy was chosen to prevent imports from interfering with domestic price support programs.

By 1968, the CAP (implementation of which began in 1962) had created a single Community market for most agricultural products. The variable levy, protecting domestic prices, is a basic feature of this system. Except for indirect controls on sugar, there are no production controls; and export subsidies are used to dispose of excess production.

Details vary by product, but in general, the amount of the variable levy is the difference between the lowest offer price on the world market and an internal Community support price. The level of the tax is set so that the lowest cost imports cannot undercut the highest cost producers within the Community; this procedure tends to increase the prices of imports above those for domestic goods. Examples of the ad valorem equivalents of variable levies at a fixed point in time show an extremely wide incidence of duty levels, ranging from 2 percent to 480.2 percent. Rates on individual products are subject to wide fluctuations.

The three new members of the European Community, the United Kingdom, Ireland, and Denmark, have agreed to accept the EC price and marketing systems for agricultural products and the EC price support levels over a staged transition period extending until December 1977. In February 1973, the new members installed CAP procedures for guaranteed or support price, market intervention (price support buying), and variable levies for the major products, which became eligible for export subsidy payments.

Devices used under the CAP--including variable levies to limit or exclude imports, support of internal prices at high levels, a general absence of production controls and export subsidies and other measures to remove excess production--have produced continuing rising agricultural prices (and increasing food costs to EC consumers), impressive increases in EC agricultural production, and an increasing necessity to subsidize the disposal of excess production in the world market.

Trade impact of EC variable levies.--The effect of the EC's variable levy system has been pronounced, relegating the United States and other supplying nations to the role of residual suppliers in the EC market for

products covered by variable levies. Exporting nations have complained that in addition to being deprived of the chance to compete through price, their opportunities have been further limited because of uncertainty of the levels of charges and the different interpretations of regulations among EC member countries.

The impact of the variable levy and its companion measures has been significant. From 1961 to 1970, the value of U.S. agricultural exports to countries outside the Community grew more than twice as much as exports to EC countries. For U.S. export commodities affected by the levy in 1971, the growth of exports from the 1959-61 period was less than one-fourth that of commodities not subject to the levies.

Although the absolute value of U.S. sales of agricultural commodities to the European Community increased between 1961 and 1970, the U.S. share of the import market declined in favor of increased trade among EC member countries. Other third countries have also experienced increasing difficulty in exporting to the Community, thus causing increased competition in other agricultural markets. While the U.S. share of the EC import market declined from 14 percent in 1961 to 11 percent in 1970, the share held by intra-EC trade increased from 20 percent to 36 percent. If the growth of agricultural exports between 1961 and 1971 had followed the same trend as in the 1954-61 period (before the introduction of the CAP), EC imports of U.S. agricultural commodities would have increased 150 percent (instead of less than 50 percent), while intra-EC trade would have increased only 122 percent (instead of 238 percent). As the CAP is extended to the new EC members (the United Kingdom, Ireland, and Denmark), the severity of the impact on U.S. agricultural exports will undoubtedly increase.

Although the aggregate level of U.S. agricultural exports to the Community has increased substantially above levels prior to the CAP, much of the increase has been in products not subject to the variable levy. The slight increase in U.S. exports of products subject to the variable levy in 1968-70 over the 1959-61 levels has been largely due to increased U.S. corn exports, the result of a rapidly expanding livestock and poultry industry within the Community. For some other products covered by variable levies such as rice, wheat and wheat flour, U.S. exports to the Community have shown little growth and U.S. exports to the Community of grain sorghums, barley, oats, and poultry have suffered severe declines from 1959-61 levels. The largest increases in U.S. agricultural exports to the Community have been in oil seeds, oil cake and oil meal, which (along with tobacco) were bound under the GATT in the Dillon round of tariff negotiations and thus not subject to large duty increases through use of the variable levy.

Variable levies in the United Kingdom.--From 1947 through 1971, the United Kingdom's agricultural policy emphasized income supplements to farmers (through a deficiency payments system) rather than price supports. Both import duties and market prices remained relatively low. Movement away from the deficiency payment system for grains began in 1964, with a grains arrangement between the United Kingdom and Argentina, Australia, Canada and the United States. Minimum import prices, normally slightly below world prices were supported by levies (often at nominal rates). After 1964, most other suppliers became parties to the arrangement, which was designed to limit imports at rates below normal world prices. Uncertainty about United Kingdom variable levies was eased by announcement of

anticipated future charges, with the importer receiving the lower charge, if the actual levy on pre-arranged imports differed from the anticipated levy. 1/

In 1971, with the prospective entry of the United Kingdom into the European Community, a complete shift from the deficiency payment system was made toward the EC system of higher tariffs and minimum import prices supported by variable levies. Variable levies were extended to such commodities as beef and veal, certain dairy products, eggs, and poultry. The United Kingdom is to conform to EC agricultural regulations over a 5 year transition period, with staged increases in agricultural support levies, raising the level of protection on over 80 percent of U.S. agricultural exports to the United Kingdom.

U.S. and other third country agricultural exports to the United Kingdom are expected to decline. Declines may be expected in U.S. exports of beef, milk and milk products, poultry, eggs, lard, sugar, wheat, feed grains, and certain fruit. The United Kingdom could become self sufficient in beef and veal and might even achieve a small surplus in grains through entry into the Community. CAP incentives could make the United Kingdom a net exporter of pork, poultry, and eggs.

Variable levies imposed by other countries.--A number of other countries employ variable levies on numerous agricultural products. Countries employing variable levies include Austria, Denmark, Finland, Greece, Spain, and Sweden. Although some of the major U.S. export products (such as tobacco in most of the countries and soybeans and dried fruit in several) are not subject to variable levies, other items of importance in U.S. agricultural exports to these countries are covered by variable levies which suppress trade (e.g., chicken meat to Austria and Greece).

---

1/ For further details see chapter VII, p. 27.

Sweden has exempted a few of its agricultural imports from EFTA countries from variable levies, and Finland has introduced legislation to exempt EFTA agricultural imports from the levies. Denmark is to make its agricultural system conform to that of the European Community over a 5 year transition period.

#### Border tax adjustments for internal taxes

A border tax adjustment is defined as any fiscal measure which enables imported products to be charged with a tax equivalent to that assessed in the importing country on similar domestic products, and which enables exported products to be relieved of a tax charged in the exporting country on domestic products sold to consumers in the home market. Thus, "border" tax adjustments include taxes on imports not only at the time of importation, but also at any subsequent point in the distribution channel, and any exemption from taxes on exports, in addition to the repayment, upon exportation, of taxes already collected on products which are exported. Under this general definition, virtually all countries make some kind of border tax adjustments on their imports and exports.

Under international practices incorporated into the General Agreement on Tariffs and Trade, indirect taxes (usually called consumption taxes or taxes on products) are considered eligible for border tax adjustments. Direct taxes (e.g., income taxes, profits taxes, etc.) are not regarded as eligible.

Foreign nations rely more heavily upon indirect taxes for government revenue than does the United States. The major consumption taxes in foreign tax systems, with respect to imports, are collected when the goods enter the country, rather than later in the distribution process. Thus, beyond

the regular import duties, products imported by these countries are immediately assessed with border taxes which are generally substantial and highly conspicuous. Moreover, products exported from these countries are shipped abroad at prices substantially below the internal domestic price because the consumption tax is not collected on the exported goods (or will be refunded if it has been collected).

On the other hand, only a few products imported into the United States are subject to a border tax adjustment at the time of entry. Generally, U.S. border tax adjustments are found later in the distribution channel, principally as state and local sales taxes. For the great majority of U.S. products, the differential between domestic and export prices which is attributable to the exemption of imports from internal consumption taxes is far lower than the price differential found in products of most other major trading nations resulting from the exemption of their exports from their domestic consumption taxes.

Many U.S. businessmen feel that their competitive position is prejudiced because the cost of entry of their products into foreign markets bears both U.S. and foreign taxes, while a foreign product's cost of entry into the U.S. market is lowered since it bears less foreign taxes and no U.S. taxes. Most economists argue that the link between border tax adjustments and trade is less direct, though they agree that there may possibly be some temporary adverse trade effects for foreign suppliers in the short-run resulting from border tax adjustments. The European businessman, with his own product subject to the substantial consumption taxes, views the assessment of the same tax upon imports as fair and equitable, but he does regard the remission of the tax on exports as a bonus or subsidy for his operations.

The extent to which foreign border tax adjustments may create a disadvantageous competitive situation for U.S. producers is entirely dependent upon the degree to which direct taxes are shifted forward to be borne by the consumer, and to which indirect consumption taxes are shifted backward to be borne by the producer rather than the consumer. There is little empirical knowledge on tax shifting. Most current economic theory recognizes the possibility of some backward shifting of general consumption taxes onto the factors of production in certain circumstances, and is generally recognized that if tax shifting for either consumption or profits taxes occurs, the extent to which the tax may be shifted depends on general economic factors in the relevant country.

General border tax adjustments, such as those for the value-added tax (VAT) widely used in Europe, under certain economic conditions, can affect trade in a manner similar to an exchange rate change. Changes in tax rates and accompanying border tax adjustments can theoretically disturb trade over short periods of time.

Purpose and operation of border tax adjustment in the tax system.--

Border tax adjustments seek to compensate on traded goods for the price effects of an internal tax. For a long time, the assumption of policy-makers has been that indirect taxes will be very largely, or entirely, passed along to the final consumer.

Border tax adjustments can be trade neutral (having no distortionary effect on trade), or they may distort trade if, for example, a different rate is applied to domestic products consumed in the home market or the mix of economic circumstances requires that the consumption tax is not totally shifted forward to the consumer. The magnitude of the trade

distortion depends on the magnitude of the difference between the border tax adjustment and the domestic price increase at the time of the institution of the indirect tax.

Border tax adjustments in the context of general equilibrium theory.--

A really meaningful economic analysis of border tax adjustments can only be made in the context of all relevant factors which are constantly exerting their force toward a general equilibrium in the economic world. In such a context, where many aspects of the economy impinge on the final results of an indirect tax increase, several points should be remembered. The border tax mechanism can be used to allow an extra improvement to be made in the trade balance during a period of government deflationary economic policy. However, it can also be managed to produce the opposite effect. In the situation where the competitive position of domestic firms is improved through the border tax mechanism, the inflationary policies which enable this can also have strong adverse effects. Any trade gains made in conjunction with border tax adjustments and domestic policies may last only for a short period of time, and the long-run result may be quite different from the short run.

A general classification of taxes and principles of their application.--

Taxes are often divided into two broad categories: direct and indirect. The main point of distinction between direct and indirect taxes is their point of payment in the income/expenditure cycle of the public. Direct taxes are levied directly on individual income; indirect taxes are usually levied on goods and services (therefore, only indirectly on incomes). It is popularly held that the burden of a direct tax cannot easily be shifted to some other persons by the person on whom it is levied, but an indirect tax can be easily shifted on to someone else.

To avoid double taxation of incomes in internationally traded goods, it is longstanding international practice that products be subject either to the taxes of the exporting country (the country of origin principle) or to the taxes of the importing country (the country of destination principle). Since the origin principle is usually applied to direct taxes and the destination principle to indirect taxes, income taxes are generally imposed according to where income is earned, while consumption taxes are imposed according to where goods are consumed.

The destination principle vs. the origin principle in border tax adjustments.---If border tax adjustments were applied according to the origin principle instead of the destination principle, the indirect tax over the long run would be fully absorbed by wages and profits and wages and capital prices would be below what they would have been if the destination principle had been applied (at the same exchange rates). However, consumers' real income would be the same under either the origin or destination principle provided the ratio of total taxes to GNP was the same under both tax adjustment schemes.

If two economies have equal total tax burdens, with all other conditions equal except the tax systems and with a proper constant exchange rate between them, one economy could use the origin principle and the other the destination principle, and neither would suffer a comparative disadvantage in world trade in the long run because of the difference in principles used. Provided wages and profits have had sufficient time to adjust, a country which relies more on the origin principle of taxation (associated with direct taxation) than on the destination principle does not suffer a comparative disadvantage in trade in the long run.

Trade effects of internal tax changes.--Several generalizations can be drawn about the situations that might lead to trade balance changes in conjunction with certain taxation changes. Any movement from the origin to the destination principle creates a possibility for a trade balance movement if other economic conditions permit. An indirect tax increase can cause such a movement if other conditions stay the same, since an indirect tax increase would constitute a movement from the origin principle to the destination principle (relatively) for the entire tax structure. Any movement from the destination principle to the origin principle can create the conditions for a possible deterioration of the trade balance in the short run.

Looking at data for the United States and several major trading partners for the period 1951-70, it appears that absolute differences in indirect tax shares can and do persist between countries over periods in which trade balances have oscillated from surplus to deficit. The data show that from the early 1950's to the mid-1960's, any trade effects that resulted from changes in indirect taxes have probably been in the long run neutral or even a positive factor for the U.S. trade balance. From the late 1960's, some European nations have started to reverse the long term trend and created a possibility for slight temporary improvements in their own trade balance through domestic policies plus border tax adjustment trade effects.

Comparative tax burdens and tax systems.--In examining some general data on taxation in the major trading nations and on tax systems in general, it is seen that taxes have grown relative to GNP for most of the countries over the decades of the 1950's to the 1960's. In the decade of the 1960's,

the tax burden for most countries was quite similar and the U.S. tax burden was slightly below the average. If the tax burden measures exclude social security taxes, the relative tax burden positions remain roughly the same and the U.S. tax burden, though slightly below the average, is often slightly above that of the major Common Market countries. A measure of the direct corporate tax burden as a percentage of GNP shows that the U.S. corporate income tax burden is relatively high compared to most of the other countries studied (except Japan). If the corporate tax burden picture includes the contributions to social security, the corporate tax burden in the United States is about average, is below that of the Common Market countries and has been roughly the same (relative to the mean) over the time period covered (1953-1970).

Direct and indirect taxes in the major tax systems.--It is primarily in the area of the relative mix between direct and indirect taxes in the tax system that most industry complaints are found. Examining the ratio of indirect taxes to total tax collections for the major OECD countries with and without social security taxes, the ratios for the United States have been roughly 20 to 30 percent below the average over the past two decades. Looking at direct corporate income tax collections relative to indirect tax collections, the U.S. ratio, even when corporate social security payments are included, is almost 30 to 40 percent higher than the mean in the 1960's. It also appears that the United States has not changed its mix of indirect taxes relative to the average of all countries very much over the last 20 years. Even when social security payments of business are included, the United States does rely much more on direct business taxes compared to indirect taxes than the average OECD country.

The principal border tax adjustments in selected countries.--The principal indirect taxes in Canada are a manufacturers sales tax, federal selective excise taxes, and provincial sales and excise taxes. The European Community (including the United Kingdom) is using the value-added tax. Presently, two members apply a single VAT rate; three have two rates; two have three rates, and two have four rates. Eventually the VAT rates are to be harmonized for similar goods. The United Kingdom and Italy have only recently adopted the value-added tax. All members of the Community also apply excise taxes on selected products.

The principal consumption tax in Japan is a single-stage "commodity tax" which is levied usually at the manufacture stage on a list of consumer goods other than foods, medicines, and some other essentials. Special Japanese excise taxes are levied on alcoholic beverages, sugar, and hydrocarbon oils.

In the United States, federal excise taxes apply to trucks, buses, and trailers, tires, gasoline, diesel and special fuels, lubricating oil, certain firearms, fishing equipment, sugar, alcoholic beverages and tobacco products. Most states and some local jurisdictions levy excise taxes on a fairly restricted list of products. Retail sales taxes are levied by state and local governments.

The U.S. proof-gallon/wine-gallon system.--A special situation in the application of border taxes which has had much attention for many years is found in the manner in which the U.S. excise tax on distilled spirits is assessed. In the United States, if a beverage tests 100 proof at the time the tax is assessed, it is taxed \$10.50 per gallon; if it is more than 100 proof, it is taxed a proportionate additional amount of the base tax; but if it is below proof, it still pays the full \$10.50 per gallon base rate.

Thus, the beverage which is assessed when it is below proof actually bears a higher tax per unit of proof.

For the domestic product, the tax is assessed at a point in the production process when the product is at or above 100 proof, and before it has been diluted with water to the lower proof at which it is normally bottled. Foreign producers may also have the tax levied at this point in the production process if they ship their product in bulk to the United States and have it bottled after entering the country. If the product is shipped already bottled, it normally has been already diluted and therefore must pay more tax than the competing bottle of domestic distilled spirits. In the strict legal sense, no discrimination can be found in the law. However, when viewed in the context of the customary conduct of a particular trade, a discriminatory result is found in the law's operation.

The effect of this so-called wine-gallon/proof-gallon method of tax assessment is that imported bottled spirits pay a significantly higher tax than domestic products and imported bulk products. Foreign producers of distilled spirits have described this situation as one of the major U.S. nontariff trade barriers.

#### Other charges

There are numerous other nontariff charges on imports. The better known are consular fees, stamp taxes, statistical taxes, port charges, and import surcharges. The Tariff Commission received almost endless descriptions of charges levied on imports, many of them in the last analysis actually border tax adjustments for internal taxes also assessed on domestic products. Some, such as port fees or import surcharges, are levied solely on imports. Others apply only to imports because there is no domestic production.

In complaints to the Tariff Commission, automobiles, motion picture films, and alcoholic beverages were stressed as products subjected to unusually heavy or discriminatory taxes or charges in many countries.

#### Automobile taxes and fees

Most countries of the world levy significant taxes or other charges on motor vehicles, especially passenger cars. These varied taxes are particularly numerous and usually at high rates in developing nations. Although these taxes may not appear to discriminate between foreign and domestic production or among foreign suppliers, in practice, the tax schedules tend to levy higher rates on the larger, more expensive models typical of U.S. production. In some cases, the taxes discriminate in favor of local assembly or use of local components. Many of the taxes, although applied to other products, are at higher rates for automobiles.

#### Film taxes

There are taxes on motion pictures in numerous countries, usually imposed by the national government, and frequently imposed as a theater admission tax. In several countries taxes are imposed solely on foreign-produced films, or the rates are higher on these films. Discriminatory fees or income taxes are applied to foreign films in some countries. Internal film taxes of some countries also discriminate among foreign suppliers. In several countries, proceeds of film taxes are used to aid production of domestic films. Some of the countries reported to apply these types of charges or practices include Algeria, the Arab Republic of Egypt, Argentina, Belgium, Brazil, Chile, Colombia, Denmark, France, Finland, India, Italy, Pakistan, Spain, Taiwan, Thailand, and Turkey.

### Alcoholic beverage taxes

Many countries levy a variety of excise, consumption or special taxes on alcoholic beverages. Most of these may be defined as border tax adjustments because they are internal taxes levied equally upon imported and domestic products. Many are "stamp" taxes. Alcoholic beverage exporters and producers also complained of prior import deposit costs, port fees, and consular fees.

A few complaints were received concerning discriminatory tax treatment in relation to products typical of U.S. alcoholic beverage production. France taxes grain spirits at a higher rate than spirits produced from fruit. The U.S. method of assessing duty and tax on distilled spirits was criticized as discriminatory against imports of bottled spirits.

### Port charges and maritime taxes

All ports charge taxes or fees on vessels and/or cargo using the port, usually to cover expenses relating to the port or to provide a return on invested capital. In some cases, the fees provide revenue for other purposes, such as to aid the national maritime industry. Fees customarily vary according to kinds of services used or types of cargo shipped. A number of different valuation methods are used. Particularly in developing countries, the charge may run as high as 12 or 15 percent of the c.i.f. value of the shipment.

Complaints against the amount of port charges were made in the Commission survey for shipments to Uruguay, Guinea, Libya, West Germany, Syria, the Arab Republic of Egypt, Turkey, Iran, South Africa, Switzerland, Sudan, Mexico, Taiwan, and Japan.

Statistical and administrative taxes and fees

Statistical fees are imposed in countries to cover the cost of maintaining adequate trade statistics, in a number of cases, applying to both imports and exports. Complaints against these taxes (ranging from 0.1 to 4 percent) were raised against Argentina, Austria, France, Italy, Peru, Switzerland, the Arab Republic of Egypt, and 11 countries of sub-Saharan Africa. In some countries the fee varies by duty status of the product. Italy exempts imports from other EC members from the tax.

Complaints against so-called "administrative" fees were raised against Afghanistan, Malaysia, Tunisia, Yugoslavia, and five Latin American countries.

Prior import deposits

Prior import deposit systems require importers to deposit a percentage of the value of an import (usually in a non-interest bearing account for a fixed term). Since World War II, such systems have been increasingly used to retard the flow of imports by countries with balance of payments difficulties. Countries without such difficulties have sometimes used such systems for control or surveillance of trade. In either case, the cost of imports is increased by preventing alternative productive uses of deposited funds. The amount of such deposits (collected in 20 to 25 countries) ranges from the relatively nominal fees effective in Japan until 1970 to rates in developing countries frequently above 100 percent and as high as 10,000 percent. The length of time the deposit is held also varies by country, and Indonesia was reported to keep deposits. Complaining companies dealt in chemicals, pharmaceuticals, tobacco, tools, photographic supplies and scientific apparatus, and their individual

estimates of resulting sales losses were as high as \$2 million. The GATT contracting parties have allowed the use of prior deposits only in cases of balance of payments difficulties, and have suggested guidelines limiting their duration and restrictive effect.

#### Consular fees

In many countries (principally developing countries) consular fees or charges must be paid by exporters, usually in relation to the issuance of a consular invoice or other required documentation for imports. Complaints against such charges as high as 7 percent of the c.i.f. value of shipments were raised against 23 countries, 14 of them Latin American countries. In some cases, where the fee was nominal, complaints were made against expenses incurred in fulfilling documentation requirements.

#### Stamp taxes

"Stamp taxes" are excise taxes paid through the purchase of stamps which must be affixed to articles or documents before they may be lawfully sold, purchased or used. The procedure is a common method for collecting excise tax on tobacco or alcoholic beverages or assessing taxes on the transfer of documents. In the Commission's survey, 47 complaints were received against the West African Customs Union and 21 developing countries, France, and Italy.

#### Surcharges

"Surcharges" on imports are taxes or levies applied in the same manner as customs tariffs, but in addition to the normal import duty; sometimes collected as a percentage of the normal duty. Nominal surcharges are collected for such purposes as port fees, statistical taxes, administrative taxes, etc.; whereas substantial surcharges are collected to stem

the flow of imports to correct balance of payments difficulties. In some situations, however, the surcharge is the counterpart of an internal tax also applicable to like domestic products.

Denmark, the United Kingdom and the United States have resorted to temporary use of import surcharges for balance of payments reasons in recent years. Other countries for which surcharges were the object of complaint in the Tariff Commission survey included France, West Germany, Greece, Indonesia, Italy, Japan, South Korea, Saudi Arabia, Switzerland, Turkey, 18 Latin American countries, and 7 African countries.

#### Other "special" taxes

In addition to the taxes discussed above, respondents in the Commission's survey of trade barriers objected to a large variety of other taxes or fees encountered in 7 developed countries and 43 developing nations. Many of these taxes appear to be border tax adjustments for equivalent internal taxes on domestic products, but some are levied exclusively on imports, with the receipts often used to aid national industries. The taxes ranged from nominal rates to 50 percent of the c.i.f. value of the shipment, and in some cases several different taxes were levied on a product simultaneously.

Government Participation in Trade 1/

One of the most important areas of trade distortion--perhaps even the most important--is found where governments directly participate in trade, rather than act as merely administrative overseers of commerce between private individuals. Governments participate in trade as purchasers of goods for governmental use, as buyers or sellers of goods for private use, as producers of goods or services sold to the public, as investors in private industry, and through subsidies or other aids to private business. Governments are likely to give strong attention in their trading activities to political, social, or other noncommercial considerations, as opposed to the economically more efficient market principles of comparative advantage, which generally determine the actions of private traders.

Governments have become the largest single purchaser of goods in every major country. The growth of national economic planning has led to establishment of government monopolies in important products, to the nationalization of basic industries, and to heavy governmental investment or subsidization for industries considered essential for national welfare. Discriminatory administrative decisions by government officials are often less visible as barriers to trade than tariffs or quotas. Problems in precisely identifying or quantifying particular governmental discriminatory practices, combined with the mixture of economic, political, and social goals in state trading activities make problems with governmental trading particularly difficult to address.

---

1/ See chapter IX for a detailed discussion of government participation in trade.

The existing international rules for the conduct of trade have been developed with private enterprise trade principally in view. The major part of the General Agreement on Tariffs and Trade deals with minimizing governmental regulation or interference with private trade; little is said on how the government itself should conduct trade. In fact, an important area of government trading activity--procurement for government use and not for resale--is specifically excepted from the GATT rules. The provisions dealing with state trading, in effect, have not been implemented, and the same can almost be said for the provisions dealing with subsidies.

In its present survey, the Tariff Commission received 550 complaints concerning governmental participation in trade, of which 40 percent dealt with subsidies and other aids to private industry. One-fourth of the complaints concerned state trading operations, government monopolies, and exclusive franchises bestowed by governments; and 14 percent were against discriminatory government procurement practices. The complaints dealt largely with market-economy developed countries, with Japan receiving 13 percent of complaints and the original six members of the European Community receiving 21 percent. Complaints were received concerning all major industrial and agricultural sectors. Concentrations of complaints in the industrial area were for nonelectrical machinery, chemicals, electrical machinery, transport equipment, and ores and metals. In the agricultural area, the largest concentrations were for beverages and spirits, grains, foodstuffs, and tobacco.

#### Subsidies and other governmental aids

Governments may grant subsidies explicitly to increase exports, or give more general subsidies to domestic producers. Subsidization of

of domestic producers, although often having domestic purposes such as regional development or national defence, may effectively distort international trade in the same manner as do export subsidies or import duties. Trade distortions caused by subsidies and other governmental aids constitute a major nontariff barrier to trade and are particularly difficult to deal with because of the close relationship between such barriers and basic governmental policies.

The absence of an agreed-upon international definition of subsidies or of a comprehensive list of practices which are considered to constitute subsidization has prevented meaningful international regulation or surveillance of subsidies. There is a wide range of government activity that may be regarded as subsidization, but the principal forms of governmental subsidy are as follows: Cash subsidies (explicit cash payments); tax subsidies (through reduction of a specific tax liability); credit subsidies (loans at preferential interest rates); benefit-in-kind subsidies (provisions of goods and services at prices or fees below market value); and purchase subsidies (government purchases of goods and services at prices above market levels).

GATT provisions on subsidies.--Although the General Agreement on Tariffs and Trade has not been able to define subsidies effectively, contracting parties are required to notify the Contracting Parties of the extent and nature of subsidization if imports or exports are affected. When an export subsidy harms or threatens serious harm to the interests of another contracting party, the subsidizing country is required to consult with the injured country on the possibility of limiting the subsidy. The GATT also permits a contracting party to raise countervailing duties

against subsidized exports which harm or threaten to harm its domestic industry. GATT provisions designed to limit subsidies on primary products have had little effect. Although 17 contracting parties to the GATT have developed a list of practices which are to be illustrative of prohibited subsidies on nonprimary products, compliance with notification procedures has been poor and provisions on consultation to limit subsidies have had little practical effect.

National provisions.--The U.S. countervailing duty statute provided for the assessment of special "countervailing" duties on imports which enter the United States with the benefit of a foreign "bounty" or "grant" (which are roughly earlier synonyms for subsidies), but the statute does not define what bounties or grants are. This is left to the interpretation of the Treasury Department.

Both the European Community and the European Free Trade Association have enacted provisions that attempt to limit government aids to exports that have a restrictive or distortive effect on trade and competition within the two respective groups of nations.

Subsidies which affect trade.--Subsidies may limit imports by lowering costs and prices of competitive domestic products. Provided that foreign demand is sufficiently large and elastic, subsidies which lower the cost for domestic producers or cover losses occasioned by international sales below domestic prices may promote exports. Governments may admit more freely to using import limiting subsidies than subsidies which encourage the export of industrial products, partly because the latter practice is more clearly contrary to rules of the GATT. Examples of import limiting subsidies are the United Kingdom's concessional assistance to its

domestic aluminum industry, assistance given to declining textile industries in several advanced countries, and subsidies to coal production and consumption given in the European Community.

Export subsidies are frequently calculated in relation to actual exports and usually are given directly to exporters. Agricultural export subsidies, principally by direct cash payments on exports or through direct sales by the government at world market prices of goods purchased domestically at higher prices, have been employed by the European Community, the United States, and other countries.

Government aids to export financing.--Credit subsidies constitute probably the fastest growing area of subsidization of international trade in recent years. Export financing at concessional rates and export credit guarantees have been provided by governments of all major industrialized countries for many years. Such assistance occurs principally in the provision of direct loans, guarantees of loans made by commercial banks to foreign buyers of the country's exports, insurance, and guarantee of credit extended by exporters. The purpose of these operations is to finance exports that would not otherwise be purchased.

The United States and most of the major U.S. trading partners have similar arrangements for export financing aids. U.S. assistance is handled through the Export-Import Bank of Washington. Concessional financing by the U.S. government of agricultural exports under various laws has been especially significant. Medium-term and long-term export credits in France are financed by private companies but then refinanced by special government-controlled credit institutions. The Export-Import Bank of Japan also directly finances long-term export credits charging significantly

lower interest rates than commercial banks. The Japanese Government insures exporters against a wide range of risks; even against the risk of tariff increases in export markets. In the United Kingdom, the Export Credit Guarantee Department (ECGD) provides credit insurance to exporters, guaranteed rates of return to banks, and refinancing of bank credit in order to keep export credit rates on a low level. Although concessional financing has largely been used to support sales to developing countries (which have lesser financial liquidity), there is a growing tendency for governments to guarantee financing on concessional terms in transactions between industrialized nations.

Special tax advantages for exporters.---Several governments provide special tax advantages for export activity, usually by exempting or deferring income tax, rebating other direct taxes associated with production of exported products, or by accelerated amortization of assets used in production for export. On the premise that indirect taxes are fully shifted forward to the consumer, while direct taxes, such as income taxes, are fully absorbed, the GATT permits the rebate of indirect taxes for exported goods, but prohibits such rebates for direct taxes. If, however, the forward shifting of indirect taxes is incomplete, a full restitution of indirect taxes for exported goods acts as a subsidy. In Italy, rebates of direct as well as some indirect taxes have been made on exports of certain products, and the U.S. Treasury Department has applied countervailing duties against such subsidies on several Italian products shipped to the United States.

Tax deferral or exemption schemes designed to promote exports in various countries include: Tax exemption for sales income of foreign subsidiaries; special reserves or deductions for expenses incurred in

establishing export markets; and tax incentives for capital investment which results in exports. In the U.S. Revenue Act of 1971, deferral on half of retained export income is provided for Domestic International Sales Corporations (DISC's), which must confine activities almost entirely to selling and related activities. Tax deferrals last as long as profits are reinvested in export activities, and have thus been criticized as export subsidies, even though some countries criticizing the United States have similar tax deferrals for exports.

Export promotion services.--Governments of all developed countries and many developing countries provide various services to foster exports, generally including research of potential export markets, trade missions, trade fairs, and marketing assistance. In the Tariff Commission survey, many U.S. producers complained that they did not get assistance from the U.S. government equal to that granted to their competitors by foreign governments.

Subsidies in specific economic sectors.--Some economic sectors are widely subsidized in numerous countries. The coal and petroleum industries are strongly assisted by governments that wish to sustain indigenous energy resources. Subsidies granted to the coal industry in the European Community, Japan, the United Kingdom, and Canada may have adversely affected U.S. exports. The petroleum industry receives special tax privileges in the United States and most other countries, and receives direct grants in some countries. West Germany, the United Kingdom, and France give large grants to their computer industries and governments of the latter two countries directly participate in the industry. A number of industrialized countries, such as France, West Germany, and Japan subsidize the electronics industry, with Japanese aids particularly strengthening the competitive position of Japanese products in the U.S. market.

Complaints of U.S. electronics manufacturers regarding Japanese subsidization of its electronics industry are challenged by the Japanese and by interested U.S. importers, who claim that U.S. assistance to the domestic electronics industry has been incomparably greater than the Japanese government's assistance to its own industry, if the massive U.S. research and development subsidies for defense and space are taken into account.

Although the United States does not subsidize the film industry, all major U.S. trading partners and many other countries do, sometimes leading U.S. film companies to produce abroad.

Shipping and shipbuilding is widely subsidized. A number of countries, including the United States, support the shipping industry by practicing "flag discrimination," i.e., permitting only national ships to engage in certain commerce. Countries such as the United States, Canada, and Italy also subsidize their shipping and shipbuilding, in order to gain domestic self-sufficiency. U.S. subsidies are much higher than those of other countries, with the U.S. government subsidizing over half of construction costs. Major exporters of ships, such as Japan and West Germany, subsidize shipbuilding.

Other industries which countries typically subsidize are the aircraft, steel, paper and pulp, and textile industries. Some industries are subsidized when they are located in so-called development areas (principally in the European Community and the United Kingdom). U.S. subsidies are devoted principally to atomic-, space-, and defense-related projects and medical research, whereas in other countries, subsidies are frequently aimed far more directly at general products for industry or consumers.

These latter subsidies act more directly as stimulators to exports or for import substitution in the subsidized industries.

Subsidies are widely applied in agriculture. Most industrialized countries materially aid their domestic agriculture, and at the same time protect it against import competition. In addition to aid through direct payments and purchases of surpluses, governments aid agriculture indirectly with subsidies for services, transport, research, etc. These widespread subsidies have led to low and unstable world prices and major distortions of world production and trade in many affected farm products. Subsidies and export surpluses generated under the Common Agricultural Policy of the European Community (most evident in grains, dairy products and sugar on the world market) have adversely affected U.S. exports. In spite of extensive subsidies of food production in Japan, the most important single export market for U.S. agricultural products, Japanese food imports from the United States have increased markedly.

U.S. agricultural programs and policies have far-reaching effects on world trade in agricultural commodities. Stabilization of domestic prices to protect farm income affects such export commodities as wheat, corn, cotton, rice, tobacco, grain sorghum, milk, and soybeans. In addition to the indirect encouragement of agricultural exports through domestic price-support programs, some exports are directly encouraged, particularly to assist the economic development of needy countries. Direct U.S. export assistance payments for certain agricultural commodities have declined sharply in recent years with the reduction of support prices for several major export crops to or nearly to world price levels.

A large number of complaints dealing with subsidies and other aids were received in the Tariff Commission survey, largely concerning developed countries. About one-fourth of these complaints were against the original six members of the European Community; one-fifth were against Japan; 17 percent were against EFTA countries; and about 4 percent were against the United States. All agricultural sectors were mentioned; the industrial sectors most frequently mentioned were nonelectrical machinery, electrical machinery, transport equipment, photographic and cinematographic supplies, and sound recording or reproduction apparatus.

#### Discriminatory state trading

State trading is defined here as the buying or selling by state enterprises, or by private enterprises upon which the state has conferred some exclusive privilege, of products or services destined for consumption by the public. State trading does not include purchase or sale of goods or services by governments for their own use and not for resale. State trading usually is conducted by special agencies operated for a specific purpose and organized as a branch of government or as a public or private corporation. Such bodies frequently may hold a monopoly for the buying or selling of a particular product or group of products.

Virtually all trade of Communist countries is conducted by state agencies. In market economy countries, state monopolies in selected products traditionally were instituted to raise revenue, to regulate the supply or price of staple commodities, or for social control, and involved such products as salt, matches, tobacco, alcohol, and (less frequently) certain staple foodstuffs. State trading in market economies has increased tremendously in the past few decades because of persistent foreign exchange

shortages (particularly in developing countries) and because of the increased use of national economic planning. State trading is also the unavoidable accompaniment of the nationalization of an industry. Some governments have monopolized trade in certain products for national defense purposes.

Whereas private business must normally operate on commercial principles, state trading is strongly influenced or determined by noncommercial considerations. A state enterprise may discriminate against foreign suppliers simply by a decision not to buy or by charging an unduly high markup on the imported product when it is resold in the domestic market (with the same effect on imports as a tariff). State monopolies may also discriminate among foreign suppliers.

State export monopolies have been used to facilitate exports on the world market when domestic prices are above the world level; to control exports in order to maintain a specified world price level; or to prevent the exportation of a product needed by domestic industry.

In the GATT, state enterprises are instructed to give nondiscriminatory treatment to imports or exports and make purchases and sales solely in accordance with commercial considerations. Import monopolies are not allowed to afford protection to domestic products in excess of that afforded by tariffs, and they must disclose import markups upon request to the Contracting Parties.

In the Tariff Commission survey, complaints concerning state trading and discriminatory practices by government monopolies involved virtually every developed market economy country and 39 developing countries. Products in 17 of the 23 industrial sectors and all of the 9 agricultural

sectors were involved. Complaints against the major trading partners of the United States involved controls on trade in alcoholic beverages in Canada, West Germany, and Japan; tobacco monopolies in France, Italy and Japan; controls on trade in grains in Canada and Japan, and state controls on trade for a number of other products, such as steel, and radio and television broadcasting.

Although the United States has relatively few areas of state trading at the federal level, the magnitude of these operations, principally in connection with the disposal abroad of surplus agricultural commodities and the purchase and sale of strategic raw materials for stockpiling, has been such as to place the United States among the world's top state traders. The federal government also controls trade in helium and fissionable materials. In addition, a number of state governments control the distribution of alcoholic beverages.

#### Discriminatory government procurement

Governments are the largest single purchasers of goods and services in most countries of the world, with U.S. government purchases, for instance, accounting for as much as 21 percent of the gross national product. The importance of governments, quasi-official bodies, and government-affiliated organizations as purchasers increases daily. Although governments usually exhibit some concern to allow all or most of their domestic producers the opportunity to share in supplying public purchases, there is generally discrimination in government procurement against foreign sources in favor of domestic suppliers. While governments may openly favor domestic suppliers, as in the Buy-America Act of 1933, in many cases countries discriminate against foreign suppliers informally, rather than openly through public laws and regulations.

In addition to the inherent psychological bias in favor of dealing with fellow nationals, one of the main practices that inhibits foreign participation in government procurement is the insufficient publicity given to the solicitation of bids and in the disclosure of the criteria on the basis of which contracts are to be awarded. The principle techniques used in the solicitation of bids for government purchases are: Public tender, where invitations to bid are publicized widely; selective tender, where invitations are limited to selected suppliers; and single tender, where the purchasing authority contacts one supplier only. Although public tender is the most important tendering procedure in the United States, Belgium, and Luxembourg, most U.S. trading partners, such as Japan, the United Kingdom, and most European Community countries predominantly use selective and single tender. It is generally recognized that selective and single tender lend themselves to discriminatory practices more readily than public tendering.

Although governments generally use commercial criteria in evaluating bids, most procurement authorities have some freedom to introduce other criteria in awarding contracts, thereby permitting price or other preferences to be given to domestic suppliers. Bidding requirements or advance technical requirements may further disadvantage foreign bidders. Procurement policies may discriminate unequally among foreign bidders, and domestic preferences may be extended to only some domestic suppliers. Governments typically show more discrimination in procurement of certain goods, such as military goods or products of high technology, than for other goods. In some countries, discrimination against foreign suppliers may be particularly used in regard to large contracts.

International concern with procurement practices.--Only recently have governments begun to show much concern over discrimination against their industries in procurement by other governments. Indeed, discrimination in the purchase of products by a government for its own use is expressly permitted in the General Agreement on Tariffs and Trade. More attention has been recently focused on this question, however, partly because of the increasingly large percentage of purchasing by the public sector in most countries. The United States, with published regulations specifically spelling out the degree of discrimination to be applied against foreign bidders, has been an obvious target of criticism from other countries.

A series of formal discussions of procurement practices, begun in the early 1960's in the OECD, eventually led to an effort to develop an international code of conduct covering government procurement. Although substantial progress has been made in developing such a code, major difficulties remain. U.S. trading partners have urged the elimination of U.S. buy-American margins, while not acceding to U.S. demands to eliminate their more covert forms of de facto discrimination against foreign suppliers.

In the European Community, a recent directive attempted to limit discrimination by member states against other EC firms in the award of public works contracts. Another proposed directive would eliminate such discrimination in public procurement of certain products. Similarly, a set of rules has been developed among countries of the European Free Trade Association to promote nondiscriminatory treatment for members of the Association in purchases by their governments, nationalized industries, and semipublic enterprises.

Trade impact of discriminatory procurement.--Only extremely rudimentary and fragmentary data are available to indicate the amount of imported products purchased by governments in comparison with their purchases of domestic products. One rough estimate found that the bias against imports in U.S. government procurement was equivalent to that which would result from the imposition of a 42 percent rate of duty. A similar bias was found for French government procurement.

Trade complaints.--Complaints concerning government procurement received by the Tariff Commission were levied against all the major market-economy developed countries and 13 developing nations. In order of numerical importance, complaints were against the European Community (one-third of complaints), the United States (one-fourth), and members of the European Free Trade Association as it existed prior to 1973 (one-fifth of complaints).

Examples of discriminatory procurement.--In some cases, discrimination in government procurement has been formally required, such as the West German, United Kingdom, or Italian preferences given to domestic industries in economically depressed areas. Another example of formally required discrimination is the West German "bilateral reciprocity" in military purchases in order to offset balance of payments effects of the maintenance of U.S. forces in Germany. In many cases, however, the purchasing authority favors domestic suppliers even though not legally required to discriminate. Frequently in France, Japan, and the United Kingdom, discrimination is facilitated by the many contracts not awarded on the basis of open public bidding. Technical standards in countries such as France and the United Kingdom also act to discriminate against foreign suppliers. Canada and numerous other developed countries give preference

(e.g., 10 percent) to domestic suppliers of goods in considering bids. The United Kingdom has favored Commonwealth suppliers over foreign suppliers in awarding contracts.

In the United States, the Buy-American Act of 1933 set up formal margins of preference to be granted domestic suppliers for government procurement. Much higher margins of preference (50 percent instead of 6 or 12 percent) are used by the U.S. Department of Defense in military procurement. U.S. laws provide for preference to be granted for certain social groups, such as the blind and prisoners. Many state and local governments also discriminate against foreign suppliers.

Miscellaneous government practices which impinge upon trade

In addition to governmental practices under the five major classifications of nontariff barriers, the following practices, applicable to numerous countries, were criticized. Traders complained that trade has been hindered by governmental practices which have led to international monetary problems; by "buy national" campaigns; by government limitations and regulations on commercial aviation, which indirectly limit the sale of aircraft; and by difficulties in repossessing large purchase items on which the purchaser has defaulted in payment. General complaints against the United States included the "extra-territorial" extension of U.S. anti-trust laws; the threat of restrictive legislation on U.S. imports; the insufficient cooperation between business and government in foreign trade matters; import restrictions and uncertainty resulting from application of escape-clause provisions of the Trade Expansion Act of 1962, and the provision of section 337 of the Tariff Act of 1930 dealing with unfair

practices in import trade; and difficulties in obtaining immigration clearance to bring foreign nationals to the United States for training in the use of U.S. produced equipment.

The close relationship between the Japanese government and Japanese business was said to aid Japanese exports and deter imports. Spain and some other developing countries were criticized for requiring importers to purchase some products directly from the original manufacturer, rather than from secondary distributors. U.S. exporters to some Communist countries felt that sales were inhibited because they had to deal with a central purchasing agency.

Standards as Technical Barriers to Trade 1/

Standards are laws, regulations, specifications, or other requirements with respect to the properties of products or the manner, conditions, or circumstances under which products are produced or marketed. These requirements usually deal with: A product's quality, purity, component materials, dimensions, level of performance, or other important characteristics; the health, sanitary, safety, technical, or other conditions or circumstances under which a product is produced or marketed; and the product's packaging or labeling. Standards perform an extremely constructive and necessary role in commerce and trade, but they sometimes impede international trade and can be used as protective devices against import competition.

Detailed product standards allow international traders to exactly identify products without seeing them and are thus extremely useful. A very large--and perhaps the major--part of standards are established for purposes unrelated to commerce or trade. Primarily, such standards are intended to protect the public health, safety, and welfare by providing rules for safeguarding plant, animal, or human life and for protecting or informing consumers.

Many standards affecting international trade were originally initiated by local governments to protect the public health, safety, and welfare or initiated by nongovernmental organizations as industries developed, and eventually became accepted at the national level. In many countries, import standards regulations have been affected by a distrust of the quality

---

1/ See chapter X for a detailed discussion of standards as technical barriers to trade.

of foreign products. Such regulations can be (and have been) used for protection for domestic producers.

#### Trade barrier effects of standards

Although some standards, such as controls on pesticides, are imposed to restrict or control certain materials or substances, most standards are imposed not to restrict the use of products, but to assure that they meet certain levels of performance, quality, purity, safety, or sanitary conditions. Standards generally are not intended to discriminate among products by their origin. Nevertheless, many standards become "technical barriers to trade" and inadvertently impinge more severely upon imports than upon domestic output.

Differences among national standards (language, measurement systems, climatic and environmental conditions) often create restrictive effects on international trade, as do diverse requirements for testing, production, inspection, and certification. Inspection requirements during production are often especially troublesome to foreign suppliers and can amount to a virtual embargo. Regulations can particularly hinder international trade if they are expensive, are based on characteristics peculiar to national production, foster uncertainty as to the acceptability of merchandise, are administered in a discriminatory fashion, or cause extra delay and expense, or allow too brief a time for adapting. Bodies establishing standards may purposely base requirements on national production in order to restrict imports through building codes, fire regulations, etc. In spite of the discriminatory application of some product standards, standards are not

presently classed among the serious barriers to trade. Nevertheless, they hold the potential for becoming one of the greatest of trade barriers if concerted international action is not taken to avoid this.

At all levels of government, concern for consumer protection, the environment, and the ecology has expanded standards in many areas. The U.S. Consumer Product Safety Act, for example, has set up a regulatory commission which may issue mandatory safety standards for any consumer product. Mandatory standards for products are being issued in numbers and coverage scarcely imagined only a few years ago.

#### The development of standards and their enforcement

Standards may be mandatory or voluntary. Mandatory standards are those with which there is a legal obligation to comply. Health and safety standards and other legally mandatory standards are generally issued by local, regional, or national governments. Voluntary standards (where there is no legal obligation to comply) are usually issued by various professional, manufacturing, or consumer nongovernmental organizations. Voluntary standards sometimes become quasi-mandatory in effect, for example, when they are incorporated into building codes promulgated by the government. Government procurement specifications also often support voluntary standards. Where the market for a product is dominated by a buyer or seller of a product, as in the case of a public utility, standards may also become mandatory in practice.

International groups enacting standards depend on participating countries to implement the standards. The formulation of international standards is centered principally in two international nontreaty organizations,

the International Standards Organization (ISO) and the International Electrotechnical Commission (IEC). The membership of the two organizations consists of the national standardization bodies (often nongovernmental) of the participating countries. Other international standards organizations include the International Bureau of Weights and Measures, the International Organization of Legal Metrology, the U.N. Food and Agriculture Organization, the U.N. Economic Commission for Europe, and the Organization for Economic Cooperation and Development. Some international organizations exist to establish standards in limited geographical or political areas.

Some organizations which develop voluntary standards can give a mandatory effect to their standards through the domination of markets, the use of monopoly power, refusal of insurance, control of an established quality mark, or similar methods, even without legal authority for making standards mandatory. In absence of legal or de facto enforcement authority, compliance is normally a matter of agreement between the manufacturer of a product and the consumer. Independent testing facilities are often used to determine compliance.

#### International harmonization of standards

In evidence of the restrictive trade effect of divergent national standards, regional trading blocs such as the European Free Trade Association and the European Community began to harmonize disparate standards among their members almost immediately after formation. Of all the categories of nontariff barriers, those resulting from standards, because of their nature, probably present the greatest opportunity for amelioration or

removal, and there is general recognition that an international program of harmonization can greatly reduce the restrictive effects of standards. The attempt to establish machinery to harmonize standards and to achieve reciprocal acceptance of harmonious standards, however, is a difficult endeavor.

Agreements within regional organizations of nations, and bilateral and multilateral agreements on standards have furthered progress in harmonization of standards; and it is anticipated that some regional agreements which have been established will be expanded to include all interested nations. Problems include the lack of legal authority on the part of federal governments and central bodies of regional organizations to make commitments on behalf of private groups and smaller jurisdictions. Another problem is the diversity of jurisdictions administering standards and the lack of easily accessible information centers for traders.

The United States is moving toward a more active role in international activities to harmonize standards. Legislation is currently pending before the Congress (the International Voluntary Standards Cooperation Act of 1973, S. 1761 and H.R. 7506) to provide a formal arrangement between the U.S. government and industry in the standards field in order to enable and facilitate U.S. participation in international standards agreements. Several governmental and private organizations are working to harmonize standards both within the United States and on the international level.

For over two years, the contracting parties to the General Agreement on Tariffs and Trade (GATT) have been attempting to develop a code of conduct to assure that standards and certification procedures do not impede trade. The completion and ultimate international approval of the code is

expected to be accomplished in the new round of multilateral trade negotiations which began in September, 1973.

#### Trade complaints against standards

In the Tariff Commission's survey of trade barriers, there were a total of 520 complaints against standards and related regulations said to hinder trade. Health and safety standards were the subject of 35 percent of the complaints, and labeling and container requirements drew 19 percent, followed by industrial standards, pharmaceutical standards, and product content requirements. Although over three quarters of the complaints were against developed countries, there were a large number of developing nations also included in the complaints. U.S. standards drew more complaints in the Commission's survey than those of any other single nation, but less than the total of complaints against members of the European Community or the European Community or the European Free Trade Association.

Industrial sectors drew 58 percent of the complaints; agricultural sectors, 42 percent. Over three-fourths of the complaints in the industrial area fell in 7 of the 23 industrial product sectors: Nonelectrical machinery; chemicals; electrical machines and apparatus; transport equipment; ores, metals, and manufactures; wood and cork and manufactures; and professional, scientific, and controlling instruments. Five of the nine agricultural sectors received virtually all standards complaints in the agricultural area, while a negligible number were received concerning grains, tobacco and oil seeds. For both the agricultural and industrial sectors, health and safety standards were the largest topic of complaint.

Second and third in importance for industrial products were industrial or product standards, and marking requirements; while second and third in importance for agriculture were complaints concerning labeling and container requirements, and product content requirements.

#### Industrial and product standards

Industrial and product standards relate principally to weights, measures, container sizes, nomenclature, quality, product content, production processes, safety, ecology, and environment. This is the largest of the four major subdivisions of standards and affects the largest value of trade among the four. Regulations have been greatly expanding in virtually all countries, particularly in the areas of environment and product safety. Electrical and electronic equipment and automotive products, two sectors which are closely regulated by virtually all countries and which are of particular importance for U.S. exports, illustrate this development.

Electrical and electronic equipment standards.--A European organization called the Multipartite Accord for Assessment and Certification of Electronic Components, including all members of the European Community and the European Free Trade Association, provides for the establishment of standards for electronic components, a system of quality control inspection, and harmonization of specifications and inspection procedures in member countries. The Accord is now administered through the European Committee for Coordination of Electrical Standardization (CENEL). As the arrangement initially developed, it held the probability of virtually excluding U.S. products from the European market. However, members of the Accord approved a U.S. request for membership in 1971, but the U.S. Government has not

established the necessary administrative machinery for participation. If fully implemented without U.S. participation, the Multipartite Accord could harm U.S. exporters and adversely affect U.S. employment, the balance of trade, and balance of payments.

Standards for automobiles and farm and industrial vehicles.--Motor vehicle safety and emission laws have been enacted increasingly both in the United States and other countries, particularly in Europe. Specifications under the new laws vary widely. For U.S. exporters, the new standards are often difficult to meet and inspection is time-consuming and costly. In some cases, U.S. products must be certified abroad, rather than being tested in the United States.

Standards in the European Community (of six)

The European Community has undertaken a program of harmonization of industrial and product standards, with member states required to incorporate harmonized standards into national legislation. Of the 25 directives issued in the program by the EC council, 12 concerned automobile standards. Requirements that containers for liquid foods be exclusively in metric units are particularly difficult for U.S. exporters. U.S. exporters of seeds encounter difficulties in getting seeds tested and approved for importation into the Community. Wine standards under the Community's Common Agricultural Policy inhibit U.S. exports of wine.

Complaints of standards hindering U.S. exports to individual members of the Community concerned the following products: Gold jewelry in France and Italy; container-board liners and aircraft in France and Germany;

hardware in Germany and the Netherlands; spirits and pressure vessels in France, Germany, and Italy; steam generating equipment in France, Germany, and Belgium; gas appliances and hybrid seeds in France; and film, welding and cutting equipment, and scientific apparatus in West Germany.

#### Canada

Standards in Canada for electric ranges necessitate reengineering of U.S. products. The number of can sizes for retailing of certain foods is restricted, and five standard U.S. can sizes are prohibited. U.S. fruit and vegetables which do not meet grade and quality standards of any U.S. marketing order cannot be imported from the United States but may be entered from other countries.

#### United States

Complaints against U.S. industrial standards were directed principally against the Department of Transportation standards for high pressure gas cylinders; Coast Guard inspection of safety equipment on U.S. flag vessels; Federal Housing Administration standards for window glass; Department of Agriculture marketing orders on vegetables and fruit; safety and emission standards for motor vehicles; Underwriters Laboratory guarantee of inspection on products such as electrical appliances and apparatus, medical equipment, and gas and oil burning equipment; standards of professional and industrial associations covering products such as plumbing, heating, and fire-fighting equipment, lumber, pressure vessels, boilers, industrial fans, bicycles, and steel. Many of the organizations which discriminate against foreign products have their seal of approval required by local jurisdictions, effectively restricting foreign imports. The American Society of Mechanical Engineers and the National Board of Boiler and

Pressure Inspectors, both faced with antitrust suits by the U.S. Department of Justice, were forced in 1972 to permit foreign manufacturers who meet requirements to use approval stamps on an equal basis with domestic manufacturers.

The United States was also criticized by domestic manufacturers for its failure to adopt the metric system, thus restricting acceptance of U.S. products overseas.

#### Other developed countries

The following U.S. exports were said to meet industrial and product standards barriers in other major countries: Electrical equipment or electrical appliances in Denmark, Finland, Norway, and Sweden; aircraft in the United Kingdom, Switzerland, and Japan; articles of precious metal in the United Kingdom, Sweden, Switzerland, and Japan; distilled spirits in the United Kingdom and Japan; fertilizers in Finland; shoes in Norway; lawn mowers in Sweden; canned food in Australia; and packaged food, medical and clinical apparatus, and sensitized photographic supplies in Japan.

#### Labeling and marking requirements

In industrialized countries, the growing concern for consumer protection is bringing an increasing number of products under labeling requirements and expanding information required on labels. Although labeling may create inconvenience and supplemental cost, labeling and marking requirements are mostly nuisances rather than major obstacles to trade. In some cases, however, the cost of compliance may become significant, especially if information required is detailed and differs considerably from one country to the next. For most firms involved, the international harmonization

of labeling and marking requirements would reduce costs, and could result in substantial trade increases for low volume articles.

Most industrialized nations and many developing countries have extensive lists of commodities which must be marked to show the country of origin. "Marks of origin" requirements are probably the most universally criticized of all labeling regulations and are often said to be imposed to protect domestic industry rather than to inform and protect the consumer. The United Kingdom, Japan, Canada, and the European Community have formally complained that U.S. requirements for "marks of origin" are excessive and more difficult to meet than those of most countries. U.S. firms importing rubber products, brass and copper tubing, steel shapes and bars, pipe, wire rod, hardwood products, radio parts, and valve and pressure gauge parts also criticized U.S. mark of origin regulations. Relaxation of requirements for marks of origin on individual items could result in substantial increases in business for some U.S. importers.

The method required for labeling country of origin can significantly affect the cost of complying with the regulation. France, for instance, requires mark of origin for some canned foods to be embossed on the end of the can, a more expensive procedure than supplying the information on the label.

In many countries, labeling requirements for alcoholic beverages and pharmaceutical products are especially complex and costly to comply with. Information required frequently varies by country. Label approval for importation of alcoholic beverages into the United States is complex and sometimes causes long delays or spoilage. U.S. exports of wine to Western

Europe are severely inhibited by appellation of origin requirements, prohibiting use of names such as "champagne" or "chianti," even if it is clear that wines involved are produced in the United States. Most nations also maintain complex labeling requirements for pharmaceutical products. International harmonization of these requirements would greatly facilitate trade.

Labeling requirements were the subject of complaint in relation to the following countries and products: Austria, citrus fruit; Canada, textile goods, adhesives, marine paints, engine additives, polyester resins; Federal Republic of Germany, oranges and lemons, canned shrimp, poultry and game products; Japan, canned foods and general requirements on all products (metric units are used and dual labeling is prohibited); Mexico, textiles and apparel; Saudi Arabia, electrical equipment, canned soups and juices; South Africa, all goods (shifting to metric units); United States, labeling requirements on imported goods in general, fiber products, clothing, fish and seafood products, cocoa, chocolate and confectionery products, watch movements; several less developed countries, canned food products.

#### Health and sanitary standards

Laws to protect the health of humans, animals, and plants exist in all countries. The health and sanitary standards of many countries (including the United States) were the subject of complaint. Most of the complaints concerned regulations on the use of food additives, regulations governing meat, poultry and seafood, and phytosanitary requirements for agricultural products. A number of complaints concerned the spreading ban on the use

of DDT. Common complaints were that trade was hampered by differing regulations among countries concerning food additives and pesticides or that inspection requirements were costly, repetitive, or impossible to meet. In a number of cases, there are blanket prohibitions against importation of products of certain countries or areas.

Health and safety standards drew complaints against numerous countries. Complaints concerned restrictions on meat and poultry, fruit (especially treated fruit), live animals, and many other products. Complaints against meat and/or poultry restrictions were made against France, West Germany, Italy, Sweden, Denmark, Finland, Norway, Austria, Australia, the United Kingdom, Canada, New Zealand, and Switzerland. Complaints concerning restrictions on fruit were made against the European Community as a whole, West Germany, Italy, the United Kingdom, Austria, Finland, and Australia. Complaints against restrictions on importation of live animals were made against Denmark, Austria, Finland, Norway, Australia, and New Zealand.

In the United States, all imported foods are subject to inspection by the Food and Drug Administration and there are specific laws controlling some agricultural products such as meat, poultry, and milk and cream. Importation of plants is rigidly controlled.

U.S. regulations are often different from those in other countries and U.S. health and sanitary regulations prohibit numerous products and make importation of other products difficult (as do such regulations in other countries). In some cases, such as the State of Maryland's virtual prohibition of products containing imported shellfish, complainants feel that the regulations are discriminatory in intent.

Japanese restrictions on food additives are claimed to differ entirely from those of the United States and many European countries. Japan has rigorous inspection requirements and prohibitions on many imported food products and plants.

Numerous complaints were also received against health and sanitary requirements in South Africa, Ireland, and a number of developing countries.

#### Pharmaceutical and veterinary standards

Complaints against the burden of pharmaceutical and veterinary standards principally concerned requirements for testing, plant inspection, special documentation, and the use of a specific pharmacopoeia. Testing requirements especially were cited as causing unreasonable delay and expense. Several countries do not accept the validity of tests and approval by the U.S. Food and Drug Administration. French regulations virtually exclude pharmaceutical imports. Italy does not recognize foreign tests. Japanese testing requirements differ from those of the United States.

Both U.S. and foreign firms complained against several U.S. requirements, including compulsory inspection of plants in the country of exportation by U.S. inspectors and repetition in the United States of research and tests.

Pharmaceutical regulations in developing countries cause problems to traders because of language requirements for documentation, conformance to any of a variety of pharmacopoeia, certification requirements, and restrictions on distributors. Some countries only permit importation of products not produced domestically.

Customs Procedures and Administrative Practices 1/

Administrative procedures and customs matters other than rates of duty frequently impinge upon the free flow of trade. Obstacles can be found in tariff classification systems, customs valuation, documentation requirements, consular formalities, antidumping practices and other administrative practices connected with the international exchange of goods. Although some of these matters, such as tariff nomenclature and customs valuation, are intimately connected with rates of duty, it has become customary in various organizations dealing with international trade to classify as "nontariff" all matters affecting trade other than the tariff rates themselves. Overly complex or strict procedures, regulations, and administrative practices may involve substantial costs to the trader and create uncertainty, especially in countries where customs officials have broad discretion in customs classification and valuation for duty and tax purposes.

In the Tariff Commission's survey of trade complaints involving customs procedures and administrative practices, the most frequent complaints involved customs valuation practices (one-third of complaints) and documentation requirements (one-fourth of complaints). About 52 percent of the total complaints were against developed nations, with 19 percent of the total concerning the United States and 8 percent concerning the European Community (of six). Valuation practices were the principal concern in developed nations, while documentation requirements drew slightly more complaints than valuation practices in developing countries.

---

1/ See chapter XI for a detailed discussion of trade barriers in customs procedures and administrative practices.

Chemical products were the subject of an unusually large number of complaints. These complaints reflected concern with documentation requirements and regulations on samples for pharmaceuticals and drugs maintained by many countries, as well as customs valuation practices of the United States. For other products, the distribution of complaints conforms fairly closely to the trade importance of the sectors.

The fact that many countries have worked to improve government administrative procedures to minimize the inconvenience and cost of customs and administrative procedures to traders is reflected in the Tariff Commission's survey of trade barriers, where complaints involving these practices were named in only about 12 percent of all complaints received.

#### Customs valuation

When ad valorem tariff rates are used, the value assigned to imported merchandise is as important as the tariff rate itself in determining the amount of duty to be collected and the valuation may be of greater concern to the importer than the tariff rate applied. In the 1920's and 1930's, concern was voiced on the need for international standards of customs valuation in the League of Nations. Broad principles of customs valuation were included in the General Agreement on Tariffs and Trade in 1947, and in 1949, an international convention set up the Brussels Definition of Value as a comprehensive valuation standard, designed to comply with general provisions contained in the GATT. Countries adhering to the Brussels Valuation Convention 1/ agree to incorporate the Brussels Definition into their customs laws. An additional 58 countries nominally apply the Brussels Definition of Value without being members of the Valuation

---

1/ In 1973, 26 countries, including most of Western Europe and Japan.

Convention. The United States, Canada, Australia, New Zealand, and South Africa are the principal market-economy developed countries which do not use the Brussels Definition.

There is a general consensus that as far as possible, customs valuation should be uniform and impartial with respect to products and suppliers, should be based on simple principles and have predictable results, should be based on commercial values in competitive transactions, and should not be used as an auxiliary tool to provide tariff protection to domestic industries. Although some complaints against valuation practices deal with practices contravening these general principles, many complaints have arisen because a procedure differs from the one familiar to the complainant.

A summary comparison of valuation practices.--The customs value of imported goods under the Brussels Valuation System is a notional concept of valuation; that is, it is based on the "normal price" of a good, defined as the price the good would fetch, if delivered to the buyer at the place of importation at the time the import duty becomes payable, assuming a sale in the open market between a buyer and seller independent of each other. Goods are dutiable based on this value regardless of whether the goods are actually traded at the time or under the conditions set up in the valuation model. Although the concept of the Brussels Valuation System is simple, and normally permits the use of the c.i.f. transaction price; the application of the system may become complex, especially in determining "normal prices" for non-arms length transactions.

Most nations not employing the Brussels Definition of Value use "positive" valuation systems, defining value in terms of the price at which and conditions under which goods are actually sold. Consequently,

positive valuation systems require two or more standards for valuation, with secondary standards to be applied in a ranked order when conditions of the preferred standard are not met. A second difference of valuation standards employed by all major market-economy developed countries which do not use the Brussels Definition is that the generally preferred value for customs purposes is the value in the country of exportation, exclusive of transportation and other charges (loosely speaking, the f.o.b. value); as opposed to the value at the point of importation (loosely, the c.i.f. value) used in the Brussels Definition. In several countries, and particularly developing nations, customs duties are assessed upon values calculated from "official prices" or "minimum prices" determined by the government.

Australian customs valuation is based on the higher of (1) the actual f.o.b. transaction price adjusted to disallow any special discount, or, more commonly (2) "current domestic value," i.e., the value of identical goods sold for domestic consumption in the country of export plus all charges for placing goods free on board at the port of export. In addition, there are additional duties on certain imported goods also made in Australia, based on an established "support value."

The basic method of Canadian customs valuation is the use of the "fair market value" of the imported goods in the exporter's country; or if this cannot be determined, cost of production plus an allowance for gross profit. Under certain circumstances (e.g., for used goods), government officials may prescribe the manner in which dutiable value is to be determined.

The U.S. Tariff Act of 1930, as amended, provides for nine standards for customs valuation of imports. The basis for valuation of the great bulk of U.S. imports is "export value" in the country of origin, or where this is not appropriate, "United States value" or "constructed value," both of which are estimates of "export value." Valuation on the basis of the selling price of competitive U.S. products (the "American selling price") is used for benzenoid chemicals, certain rubber-soled footwear, low-value wool knit gloves, and certain canned clams. For 1,015 ("Final List") articles, the primary value to be used is the "foreign value" (wholesale value in the exporting country) or "export value," whichever is higher. The Final List also contains many benzenoid chemicals subject to valuation on the basis of an American selling price standard which differs somewhat from the ASP standard applied to goods not on the Final List.

Complaints against customs valuation.--By far the most numerous of the complaints against customs valuation received in the Tariff Commission's trade barrier survey came from U.S. exporters who objected to the prevalent use of c.i.f. values for customs purposes in most other countries. Because U.S. import duties are chiefly on an f.o.b. basis (which are lower than the c.i.f. values because they do not include freight and insurance charges), U.S. producers and exporters apparently look upon assessment on the c.i.f. value in other countries as inherently unfair.

Several countries assess duties on the "domestic value" of merchandise in the country of origin if it is higher than the invoice value for the imports being considered. This practice drew complaints principally against Canada, Australia, New Zealand, and South Africa.

A large number of developing countries were criticized for using "arbitrary" values for assessment of duties. Several of these use "official values" set by the government, rather than some form of commercial value, for customs purposes. Particularly singled out for criticism in this respect were Mexico, Brazil, Argentina, Venezuela, and Peru.

A problem in virtually all valuation systems is establishing a correct customs value for imports not shipped as arms-length transactions between independent unrelated parties. Most countries adjust upward the invoice values of such imports to establish the customs value. As multinational corporations and exclusive distributorships spread around the world, problems arising from non-arms-length transaction multiply. The upward adjustment of invoice values for customs purposes in non-arms-length transactions is commonly referred to as "uplift," especially in countries using the Brussels Definition of Value. Japan, the United Kingdom, France, and Italy were particularly mentioned in complaints to the Commission concerning uplift procedures.

The American selling price valuation method used by the United States for four products (benzenoid chemicals, rubber footwear, low-priced wool knit gloves, and canned clams) has long been a major target of criticism. The ASP system usually results in the collection of a substantially larger amount of duty than would be collected if the actual value of the imported goods were used. Valuation of imports based on value of merchandise produced in the importing country is not permitted under the General Agreement on Tariffs and Trade, except, as in the U.S. case, where the system was being applied before the country's accession to the GATT. ASP valuation is applicable to less than 1 percent of total U.S. imports. Many U.S.

imports covered by ASP tariff provisions are subject to other valuation standards in the U.S. system (when found not to be competitive with a U.S. product).

A more general complaint leveled by traders against the U.S. customs valuation system is the complexity of the system which has nine specific detailed standards, ranked in the order of precedence for application, but varying with the type of merchandise. The complexity of the system, especially in regard to the so-called Final List provisions, is said to cause considerable confusion.

#### Documentation requirements and consular formalities

Every country requires some form of documentation to be submitted on products crossing its borders. Such documents are required for a variety of reasons, such as the compilation of commercial statistics, the determination of import duties, the regulation of trade, or other purposes. A serious detriment to trade in terms of costs to the exporter or importer is recognized to exist in the cost of complying with documentation requirements which are excessive in terms of quantity, complexity, formality, and the time consuming procedures associated with obtaining or clearing the documents. A recent study found that an average international shipment requires 46 different documents in about 360 copies requiring 64 hours of preparation and processing time.

Several nations, among which are Canada, Australia, New Zealand, South Africa, the United States, and a number of South American countries, require a special customs or consular invoice on merchandise shipped to them. Some nations also require these invoices to be certified at a consulate nearest the port of shipment of the cargo. Venezuela recently equated

the revenue it received from consular invoices to a tariff of 3.5 percent ad valorem.

Strong criticism has been raised against the complexity of the U.S. customs invoice and the detail of information required. Use of certificates of origin, often required by countries controlling trade with particular nations, have been protested as expensive, inconvenient, and an unnecessary invasion of confidential business information.

Nearly three-fifths of complaints concerning documentation requirements (including virtually all complaints against consular formalities) in the Tariff Commission survey related to less developed countries. Among developed countries, the United States received the most complaints concerning documentation requirements, with complaints commonly against the U.S. special customs invoice for imports, documents required for U.S. exports under programs of the Agency for International Development, or requirements for products under U.S. export control programs. The following requirements drew complaints against other developed countries: Special customs invoices for imports in Canada, Australia, New Zealand, and South Africa; documentation requirements on pharmaceuticals and drugs in Italy, Netherlands, United Kingdom, and Japan; authenticity requirements for bourbon whiskey in France, Netherlands, United Kingdom, South Africa, New Zealand and Japan; certificate of origin in Italy; complicated declaration of value in Australia; homologation certificates for boats in Italy; textile samples attached to each of four copies of invoices on textile shipments to South Africa; and extremely detailed documentation for certain products imported into Japan.

Regulations on samples, returned goods and reexports

Although most governments among the major developed countries have made some provisions in line with the idea that customs duties should not be collected on commercial samples and advertisements used to solicit sales, or on imported products returned or destroyed because of defect or non-conformance with purchase contracts, the administrative procedures which have been established for such transactions are frequently cumbersome, expensive, and time consuming. Complaints relating to samples, returned goods, and reexports received by the Tariff Commission were about equally divided between developed and developing countries. Many complaints dealt with quantitative limitations on pharmaceutical samples and advertising matter. A number of developing countries were criticized for assessing duties on samples or imposing complex and long procedures to obtain permits for duty-free entry. The United States and several other countries were criticized for having complex procedures for refund of import duties when imported products are reexported.

Customs classification of merchandise

Tariff nomenclatures (classification systems of goods by tariff category) have developed into extremely complex and detailed instruments. Tariff classifications by customs officials frequently lead to disputes as to the proper classification (and duty rate) applicable to imports. The growing complexity of these systems led to a world-wide movement to a standardized customs nomenclature. The majority of nations today classify their imports according to the Brussels Tariff Nomenclature. Canada and the United States are the only major trading nations which do not use this system. Because the classification nomenclatures of these two countries differ

substantially from the widely used standard system, they have been criticized as constituting barriers to trade.

"Arbitrary" classification practices.—The Tariff Commission received several complaints against the United States and other countries concerning "arbitrary" classification by customs officials, resulting in the importer paying higher duties than he deemed appropriate. Australia was criticized for its "substitute notice system," whereby customs officials may charge duties on chemicals and textiles at the rate applicable to a similar product. Chemicals producers, particularly, felt that the guidelines were so broad that they encouraged arbitrary decisions, higher rates of duty than appropriate, and created uncertainty. Similarly, uncertainty as to duty rates was said to result from the rate differentiation made in the Canadian tariff schedule between products "of a class or kind made in Canada" and products not made in Canada, with the former subject to higher rates of duty.

#### Antidumping practices

"Dumping" is international price discrimination, or the practice of selling in foreign countries at prices below those charged in the home market of the exporter. Under the GATT, dumping is regarded as objectionable if it distorts natural trade patterns, i.e., causes or threatens material injury to national industry (existing or developing industry). Most major trading nations have laws or regulations which assess special "antidumping duties" on dumped goods in order to raise the dumping price to the level of home market prices. In the late 1950's and early 1960's, charges became widespread that antidumping procedures were being used to provide additional protection for domestic industry, rather than just to

correct an unfair trade practice. Time-consuming administrative practices in U.S. antidumping cases were particularly criticized; and U.S. exporters especially criticized the abrupt and arbitrary nature of Canadian antidumping procedures.

An International Antidumping Code, intended to supplement and interpret GATT regulations on antidumping, was negotiated during the Kennedy round. With the exception of Australia, New Zealand, and South Africa, most major trading nations have signed the Code. The Code established rules of conduct for administrative practices in antidumping proceedings and set up a Committee on Antidumping Practices to examine antidumping actions and reconcile international differences. After controversy within the United States as to whether the Code was consistent with the U.S. Antidumping Act of 1921, the U.S. Congress, in 1968, resolved that any differences between the Code and the Act should be resolved in favor of the Act.

Of the parties to the International Antidumping Code, the United States had by far the highest level of antidumping activity in 1971-72. The frequency of complaints against Australia and South Africa (neither of which is party to the Code), would seem to indicate that they are also active users of antidumping proceedings. The less frequent dumping activity by some countries than others is undoubtedly partly attributable to a difference in commercial policy views of the countries on the matter of dumping; but it might also be partly due to the application of other measures to imports which their customs officials consider to be below normal value.

Among complaints on antidumping practices submitted to the Tariff Commission, complaints were raised against Australia and South Africa for the lengthy application of provisional antidumping duties before a final finding is made (affecting U.S. exports of chemicals and saws to Australia) and dumping duties imposed through unfair customs valuation (affecting U.S. chemical and wood exports to South Africa). Some complainants felt that South African antidumping duties had been imposed where there was no serious injury or threat of injury to South African producers. Although many of the more onerous Canadian antidumping practices were revised after Canadian adherence to the International Antidumping Code, complaints against the new system were received concerning the method of valuation in antidumping proceedings, particularly in transactions between related firms.

After the Antidumping Code was negotiated, the U.S. Treasury Department modified its administrative procedures to hasten action in antidumping cases. Nevertheless, there is continued severe criticism of U.S. antidumping practices by U.S. importers and foreign governments. A number of major countries have charged that certain practices of the U.S. treasury Department and findings of the Tariff Commission violate the Antidumping Code.

#### Countervailing duties

Countervailing duties are special duties in addition to regular duties, imposed on imported products, if, under designated circumstances, these products benefit from foreign subsidies. Under the GATT, the subsidization to be countervailed must threaten to injure or retard the development of a domestic industry. Although not explicitly defining a subsidy,

the GATT states that exemption of exported goods from indirect taxes applied to domestic consumption does not constitute a subsidy.

U.S. regulations provide for countervailing duties on imports (excluding duty-free imports) equal to bounties or grants bestowed by another country on the production or export of the product. Although the GATT requires a determination of injury before imposition of countervailing duties, the U.S. statute (which pre-dates the GATT) does not require an injury determination. Great discretion is left to the Secretary of the Treasury to determine whether a subsidy is involved and whether countervailing duties are applicable.

Few countries actually resort to countervailing, often employing other protective devices instead. In the United States, countervailing action has been infrequent. Since 1967, however, there has been an upsurge of countervailing action in the United States, against French subsidies (1968-69) and certain Italian and Canadian exports. The Canadian case (against certain tires) was the first instance where the United States countervailed against regional development subsidies. Although there has been significant subsidization of agricultural exports by the European Community in recent years, there have been few cases where the U.S. Government has chosen to apply countervailing duties (most of the products have been subject to absolute quotas).

Although critics of the U.S. countervailing duty practices (particularly the absence of a requirement for an injury finding) have proposed an international code on countervailing duty practices along the lines of the antidumping code, there has been no agreement, partly due to disagreements between the European Community and the United States. The U.S. position

has been that countervailing should be discussed in the broader context of subsidization, especially agricultural subsidization. The European Community has not wanted to discuss agricultural subsidization, but has desired to focus on the removal of the U.S. exemption from the requirements to find injury before countervailing. A solution of the problem of subsidies in international trade would automatically wipe out the practice of countervailing as well.

Discriminatory Ocean Freight Rates 1/

Many U.S. producers and exporters reported to the Tariff Commission that discriminatory treatment in ocean freight rates greatly weakens their ability to compete abroad and enhances the competitive strength of foreign industries in the U.S. market. For example, ocean freight rates on many commodities from the United States to Japan are higher than the rates from Japan to the United States on the same products. The differences frequently are large, ranging from 20 percent to well over 100 percent. Moreover, since most foreign tariffs are applied on a c.i.f. basis, and most foreign consumption taxes, such as the value-added taxes in Europe and the commodity taxes in Japan, are applied on a landed cost, duty-paid basis, the effects of the discriminatory rate treatment are multiplied.

Differences in ocean freight rates charged on the same item moving along reciprocal trade routes are called shipping disparities. This disparity problem, which is prevalent in all U.S. outbound shipping routes, apparently adversely affects only U.S. shipping trade, and not the shipping trade of other major trading nations. Such disparities have been said to contribute to the U.S. balance of payments deficit and export malaise. While acknowledging the disparities, both American and foreign shipping lines defend the discriminatory rate structures as economically just and necessary.

Shipping liners are ships which operate along definite routes on fixed schedules, usually hauling only general, rather than bulk or liquid

---

1/ See chapter XII for a detailed discussion of discriminatory ocean freight rates.

cargo. Liners are usually organized in conferences which control freight rates for shipping in only one direction (e.g., from the United States to Japan). Conferences, which have highly complex and intricate rate structures, are likely to employ different systems of rates, even though many conferences have members in common. The conference system, developed in the 19th century as a reaction against cutthroat competition, allows shipping lines to cooperate to offer dependable scheduled service at uniform charges. The system benefits both the shipowner and the shipper, the latter being assured of stable rates and treatment equal to that of his competitors.

Although the conference system fosters stability, it also has significant drawbacks. U.S. outbound rates are substantially higher than comparable outbound rates from other industrialized countries, both in shipping to other industrialized countries and to "third market" ports. Thus, U.S. exporters are put at a competitive disadvantage in relation to exporters of other industrialized countries in shipping to third country markets.

Although the shipping conferences are a kind of international monopoly, the U.S. government allows the conferences to set ocean freight rates in foreign commerce and U.S. conference members have been exempt from antitrust action since the early 1900's. The Federal Maritime Commission (FMC), established in 1961, is empowered to disapprove of particular discriminatory conference rates, and the FMC has been active in efforts to influence the conferences. However, conferences are not national bodies, and moves to control foreign-owned steamship companies and foreign-based conferences have created difficult international situations, with other nations objecting to U.S. interference.

Shipping lines which are members of conferences usually have no tie to their national manufacturing sector, with the exception of Japanese lines. This means on one hand that there is little basis for a conference to favor a particular national exporting interest, and on the other hand, that U.S. conference member lines, although aware of the U.S. disparity problem, are not likely to surrender the profits afforded to them by high freight rates.

It is not surprising that each shipping conference has a very personalized rate structure, since the commodity classification system is incredibly complex, and the application and interpretation of criteria for rates differ. Shipping rates for U.S. products reflect the fact that the value of a commodity is a major measure in determining freight rates and that U.S. unit prices tend to be higher than those of its trading partners. Another conference criterion for rates is the cost of ship operation, the greatest component of which is the cost of loading, stowing and unloading. It is possible that the presence in a conference of American liners, with their much higher expenses, may well create a need for a higher rate structure in order to allow the American liners to operate at a profit.

The conferences feel that differences in outbound and inbound rates on identical products are justified because the "product mix" of the entire cargo may be different in one direction than in another. The conference tries to charge what it thinks the traffic will bear and not to raise rates so high that a shipper's product is priced out of the foreign market, thereby denying future business to the conference.

Several U.S. laws have set up regulations requiring the transport of at least a fixed percentage of special types of government-owned or

financed cargoes in U.S. flag commercial ships. A number of other countries have also adopted cargo preference measures. The elimination of competition for government-owned cargo through the cargo preference system tends to create upward pressure on freight rates, resulting in increased disparity in outbound and inbound shipping rates.

Although some of the most exorbitant discriminatory U.S. outbound rates have an end result of adding only a few percent on the overseas selling price of the U.S. exports, this addition to the price can price marginally competitive U.S. products out of a foreign market. There are several alternatives to paying conference rates. The normal conference rates may be avoided if a shipper is able to hire an entire charter vessel, instead of a conference vessel; if a shipper does not require regularly scheduled service and can use a tramp ship instead of a conference vessel; or if a shipper agrees to ship exclusively within the conference for a particular length of time, he may be eligible for a lower schedule of rates. There is also official machinery within the conference for handling requests for rate changes.

In addition to the above possibilities for shippers to obtain lower rates, strong national shippers councils in countries such as Japan and the United Kingdom have shown themselves very able to obtain results from conferences in areas where governmental agencies have been ineffective. U.S. shippers councils have not developed strength comparable to councils in other countries, and such bodies might be liable to antitrust action in the United States.

The shipping rate disparity issue could possibly be entirely ended through the growing trend toward containerization. Standard containers

and container ships would tremendously simplify commodity rate classifications, end the disparity issue, and make the conference rate system immeasurably simpler.

## Chapter VII

### NONTARIFF CHARGES ON IMPORTS

#### Introduction

"Nontariff charges" is the term which has been coined in international trade discussions to loosely describe the very large variety of fees, levies and taxes which must be paid on imports into most countries in addition to a customs duty. The term is used in this report to cover all taxes and other governmental fees which are attached to internationally traded goods except a regular customs duty, an antidumping duty, or a countervailing duty. It includes so-called "surcharges" and "surtaxes," which are actually customs duties levied on top of a country's normal customs tariff. Many of these charges are essentially the same as customs duties, but are considered separately from the regular tariff for a variety of reasons. The statutory basis for collecting the charges usually is separate from the regular tariff schedule; the charges may be imposed only temporarily, or they may be regarded separately for other reasons which appear to differentiate them (albeit superficially) from regular customs duties.

There is a large variety of charges other than customs duties which imports into most countries must pay. Some of these charges are collected at the border when the imported product enters the country; others are collected later in the distribution channel, such as the point of final sale to the consumer or sometimes as the product is being used; and some, indeed, are even collected before the goods leave the exporting country.

Some of the charges, such as the "variable levy" now applied to agricultural imports into most of Europe, are purposely intended to discriminate against imported products and protect domestic output. On the other hand, some charges, such as U.S. excise taxes and the tax on value added (TVA), prevalent in a large part of Europe, are collected at the border with a view to assessing imported products with the same tax applied to domestic output (although there is frequent debate over the equality of treatment of imports under these taxes). Some levies, such as port taxes, are considered charges for services rendered; many countries collect a fee for required sanitary or other inspections. In some countries a fee is collected on both imports and exports to cover the cost of tabulating statistical data on the country's trade. Many countries from time to time, to cope with an acute balance of payments deficit, have levied import "surcharges" in addition to the regular customs duty. These are only a few examples; the variety of names and purposes assigned to the charges seems almost endless.

Nontariff charges on imports were second only to quantitative restrictions in the number of complaints received in the Tariff Commission's survey of trade barriers. This is perhaps due to the fact that, like quantitative restrictions, they are more highly visible and more restrictive to the trader than many other forms of trade barriers. Table 7-A presents a summary count of these complaints, by type of charge. It is interesting to note that almost one-fifth of the complaints were against charges, such as sales taxes, use taxes, etc., which generally do not discriminate between imported and domestic

1/ Charges have been classified by type in this table as they were described in submissions to the Tariff Commission by respondents in the Commission's survey of trade barriers. Charges described by the respondents as "border taxes" usually referred only to value added taxes, turnover (cascade) taxes and a very limited number of other consumption taxes levied on imports upon entry. However, under the customary definition, most of the taxes reported under the following types of charges listed in the table are also considered border tax adjustments.

3. Nondiscriminatory use and excise taxes and registration fees
4. Nondiscriminatory sales taxes
5. Discriminatory excise taxes, film taxes, use taxes, and commodity taxes
10. Discriminatory sales taxes
11. Miscellaneous special and additional taxes and fees.

Source: Compiled from submissions to the Tariff Commission.

products (types 3 and 4 in the table) and that several of the complaints were against charges, such as statistical taxes and stamp taxes, which are customarily nominal. Among the charges that were clearly identified as to type, the most frequently mentioned, by far, were the various forms of border tax adjustments, 1/ followed by port, statistical and similar entry taxes. A large number of the complaints identified the charges only as "special taxes," "additional fees," etc.

A perusal of responses in the Commission's survey shows a consistent theme: Traders object to any additional charge or cost which they encounter in distributing their products, regardless of whether the charge is large or small or discriminates between imported and domestic articles. Some of the charges are substantial, and give rise to particularly strong objections. The general sentiment is found in a brief submitted by a U.S. steel producer, for example, stressing the cumulative effect of border tax adjustments on products shipped to European Community countries. "The value-added tax, which is a significant charge, is levied on the duty-paid value of the product. The rates and additional charges, the compounding effect of their assessment, and their resultant penalty to the high-priced foreign supplier over the low-priced supplier are punitive to our trade." According to a representative of the U.S. tanning industry, "such supra-customs charges are defended on the ground that they do not represent tariff rates but reflect internal tax policy. The contention is nonsense; border taxes or border excise taxes are nothing more than a device to evade treaty obligations." Other respondents

---

1/ It should be noted that charges reported as "border taxes" in table 7-A were probably not more than one-fifth of the total number of complaints actually concerned with some form of border tax adjustment.

felt that such charges nullify tariff reductions agreed to in the Kennedy Round. A spokesman for the U.S. electronics industry, for example, states that "while the post-Kennedy Round duties are lower in both countries (the United States and Japan) for most electronic products, the Japanese have carefully retained significantly higher rates of duty on most categories not also subject to a border tax. For the categories of electronic products subject to the border tax, the combined weight of the tax and duty far exceeds the level of monetary charges imposed in the form of duties on the like products imported from Japan into the United States."

Many charges are sharply progressive or so designed in other ways as to make them more burdensome for the imported product. This is particularly true of taxes imposed upon automobiles which are usually based on horsepower or cylinder capacity. According to the association representing U.S. automobile manufacturers, "their burden on larger U.S. vehicles, as compared to traditionally smaller overseas produced vehicles, is commonly four or five times (and often over 10 times) as great."

Some of the charges complained of are the direct result of other requirements pursuant to certain regulatory procedures. For example, a domestic distiller also dealing in imported spirits reported that it is often "necessary to request a permanent customs inspector on the premises with the cost and expense of such inspector being attributed to the importer. Statutory and regulatory changes to eliminate such inspections, or curtail it for a more efficient manner, would moderately increase imports."

The most vociferous complaint concerning U.S. nontariff charges came from domestic importers of distilled spirits. They have long expressed opposition to the wine-gallon/proof-gallon method of imposing internal revenue excise taxes on imported spirits. The importers of bottled spirits contend that this system favors the domestic producer and bulk imports of 100 proof spirits which are later reduced in proof and bottled in the United States, and discriminates against the imports of bottled spirits. One important distributor states that "removal of this barrier or adjustment so that both bottled and bulk spirits are taxed on a similar basis would increase imports significantly."

Table 7-B shows the distribution of complaints against nontariff charges, by country and type of charge. The bulk (59 percent) of the complaints were made against charges encountered in the less developed countries. Port charges, statistical taxes and similar entry fees and prior import deposits drew far more complaints against developing countries than against the developed nations; but even in the developed countries, the total of complaints against the various forms of border tax adjustments far surpassed all other categories.

Two-fifths of the complaints received against developed nations were charges encountered in the European Community; one-third were against EFTA members; about 6 percent against Japan; 4 percent against Canada; and 3 percent against the United States. For developed countries, about three-fourths of the complaints were concerned with the various forms of border tax adjustments.

The distribution of complaints against nontariff charges among the various product sectors is shown in table 7-C. About 85 percent

<sup>1/</sup> Charges have been classified by type in this table as they were described in submissions to the Tariff Commission by respondents in the Commission's survey of trade barriers, as follows:

- |  |   |
|--|---|
| 1.. "Border taxes"   | 6. Prior import deposits                                |
| 2. Port and statistical taxes, etc.  | 7. Variable levies                                      |
| 3. Nondiscriminatory use and excise taxes and registration fees  | 8. Consular fees  |
| 4. Nondiscriminatory sales taxes   | 9. Stamp taxes  |
| 5. Discriminatory excise taxes, government controlled insurance, film taxes, use taxes, commodity taxes. | 10. Discriminatory sales taxes                          |
|  | 11. Miscellaneous special and additional taxes and fees |

It should be noted that charges described by the respondents as "border taxes" usually referred only to value added taxes, turnover (cascade) taxes, and a very limited number of other consumption taxes levied on imports upon entry. However, under the customary definition, most of the taxes reported under the following types of charges are also considered border tax adjustments:

3. Nondiscriminatory use and excise taxes and registration fees; 4. Nondiscriminatory sales taxes; 5. Discriminatory excise taxes, film taxes, use taxes, and commodity taxes; 10. Discriminatory sales taxes; and 11. Miscellaneous special and additional taxes and fees.

<sup>2/</sup> Includes complaints against the EC without specifying a country.

<sup>3/</sup> With respect to development status, Portugal is a "borderline" country, but usually is considered to be a "developing" country. Portugal is listed here among developed countries only because of membership in the EFTA.

<sup>4/</sup> Includes complaints against EFTA without specifying a country.

<sup>5/</sup> Includes Ireland, New Zealand, Poland and complaints against developed countries without specifying a country.

<sup>6/</sup> Excludes Poland.

1/ Charges have been classified by type in this table as they were described in submissions to the Tariff Commission by respondents in the Commission's survey of trade barriers, as follows:

- |   |   |
|---|---|
| 1. "Border taxes"   | 6. Prior import deposits                            |
| 2. Port and statistical taxes, etc.   | 7. Variable levies                                  |
| 3. Nondiscriminatory use and excise taxes, and registration fees  | 8. Consular fees                                    |
| 4. Nondiscriminatory sales taxes  | 9. Stamp taxes                                      |
| 5. Discriminatory excise taxes, government controlled insurance, film taxes, use taxes, commodity taxes | 10. Discriminatory sales taxes                      |
|   | 11. Miscellaneous special/additional taxes and fees |

It should be noted that charges described by the respondents as "border taxes" usually referred only to value added taxes, turnover (cascaide) taxes, and a very limited number of other consumption taxes levied on imports upon entry. However, under the customary definition, most of the taxes reported under the following types of charges are also considered border tax adjustments: 3. Nondiscriminatory use and excise taxes and registration fees; 4. Nondiscriminatory sales taxes; 5. Discriminatory excise taxes, film taxes, use taxes, and commodity taxes; 10. Discriminatory sales taxes; and 11. Miscellaneous special and additional taxes and fees.

2/ Total counts are not the same as those in tables 7-A and 7-B because a single complaint in those tables may involve more than one product sector and not all complaints specified a product.

Source: Compiled from submissions to the Tariff Commission.

Note.--Due to rounding, percents may not add to the totals shown.

of the complaints were in the industrial area, 15 percent in agricultural products, a division almost identical with the distribution of U.S. trade. In the industrial area, almost two-fifths of the complaints were in the transport equipment sector. These complaints concerned principally automobiles, a prime target for fees and taxes of all types all over the world which have been carefully documented and reported by U.S. automobile manufacturers. No other industrial sector drew more than about 7 percent of all the complaints submitted in the industrial area. The largest percentages were in chemicals; nonelectrical machinery; ores, metals and manufactures; electrical machines and apparatus; and photographic and cinematographic supplies.

In the agricultural area, about one-third of the complaints fell in the beverages and spirits sector. The remainder were more or less evenly distributed, except that very few were made in the sector for fish and shellfish.

The remainder of this chapter discusses the more important types of nontariff charges under three headings: Variable levies, border tax adjustments for internal taxes, and other nontariff charges.

## Variable Levies

"Variable levy" is the term commonly used for certain charges assessed on imports in lieu of, or in addition to, a normal customs duty. For regular customs duties, rates of assessment remain relatively fixed for long periods of time; the variable levy changes (usually rather frequently--sometimes daily--and often is dependent upon world market prices), hence the name. Like regular protective customs duties, variable levies are assessed on imported products for the specific purpose of increasing their cost in relation to domestic products in order to diminish or eliminate any comparative economic advantage the import may have in competing with the domestic product.

Some countries have resorted to variable levies when a stringent but flexible control is desired over the level of imports. Variable levies probably have been used most frequently to raise the cost of an imported product to a minimum import entry price; and probably the most common application has been to raise the landed cost of imported agricultural products to a level which has been predetermined by authorities administering domestic agricultural programs as necessary to prevent imports from interfering with the operation of the program. In such cases, the variable levy is often an integral part of the domestic agricultural program, and because of its use in this manner, the term, in popular parlance, is confined to

charges on agricultural imports under such conditions. 1/ For convenience, the term is used here in this popular sense, but will cover all variable charges on agricultural imports, regardless of how they are designated officially by the country applying them. 2/ Because variable levies are usually collected under laws or regulations other than a country's customs laws, countries applying such levies frequently maintain that the levy is not a customs tariff, and hence not subject to the same considerations and treatment in trade negotiations as customs tariffs.

Variable levies are not new; they have been employed by several European nations for many years. However, during the past decade they have risen to great prominence because the European Community made the variable levy an essential element in its Common Agricultural Policy (CAP), thereby spreading application of this import control device over a large and important segment of world trade. As a consequence, today the variable levy is probably the most important single measure adversely affecting U.S. exports.

As used in the European Community's CAP to equalize imported and domestic prices, the economic effect of a variable levy is the

---

1/ Variable charges on industrial product imports are given other designations, such as "special customs duty," "special tax," "minimum import price requirement," "arbitrary surtax," etc., even though the amount of the charge may be determined in a manner similar to the agricultural product levies.

2/ Semantic problems arise from the fact that some countries apply several variable charges to agricultural imports, only one of which is designated a "variable levy." The European Community, for example, applies a "variable levy," a "variable component," an "additional duty" and a "compensatory tax."

same as import quotas in that the importer cannot increase his sales by reducing prices. Some shippers contend that the CAP's variable levy is more restrictive than a quota because quotas at least provide some secure level of access, whereas under the EC's levy, imports are relegated to an unpredictable residual supply position after domestic supplies are exhausted. In addition, trade is further hampered by the element of uncertainty as to the amount of the charge which will be collected on any particular shipment. When the levy itself is moderate, exporters tend to complain less about the level of charges than about the general uncertainty that prevails under a variable levy system. Frequent changes in the variable charges cause difficulty in calculating market prices and hamper forward planning. Information concerning changes in levies is often not available promptly.

Complaints were registered with the Commission about variable levies on imports of agricultural products into the European Community, Austria, Denmark, Finland, Greece, Portugal, Spain, Sweden, Switzerland, and the United Kingdom. The total effect of these levies on U.S. or world trade cannot be determined with any degree of exactness. Together these countries have been important recipients of U.S. agricultural exports, taking over 35 percent of the total value of such exports in 1971. While exports to these countries in 1971 were 9 percent above 1966, exports to other countries increased by 13 percent.

Variable levies in the European Community

Implementation of the Common Agricultural Policy (CAP).--The European Community is the largest market for U.S. agricultural exports. It comes as no surprise, therefore, that development and implementation of the Community's Common Agricultural Policy has been of primary concern to the United States.

The Treaty of Rome lists the following agricultural policy objectives, which the CAP was created to achieve: (1) Increasing agricultural productivity, (2) maintaining a fair standard of living for the rural population, (3) stabilizing markets, (4) assuring regular supplies, and (5) maintaining reasonable consumer prices. In the CAP, the Community has chosen to maintain farm incomes through price supports rather than through domestic income supplements. Internal price support levels generally have been set substantially above world market prices, thus necessitating a control on imports to prevent their interference with the price support program. The variable levy was chosen for this purpose.

Implementation of the CAP began in January 1962, with adoption of a series of regulations establishing common arrangements governing marketing of commodities or groups of commodities, and by mid-1968, under the CAP regulations, a single Community market had been created for most agricultural products. These regulations differ as dictated by conditions of production and marketing, but most have certain characteristics. The most pervasive element is reliance on a minimum import price and some form of variable levy to protect and insulate

the domestic price from lower world prices. There are no controls on production, except for certain indirect controls on sugar. Export subsidies are provided for the disposal of excess domestic production.

In general, the amount of the variable levy is the difference between the lowest offer price on the world market and an internal Community support price, although details vary from product group to product group. For dairy products, wheat, rice, and coarse grains, the levy is equal to the difference between the designated minimum import price and the lowest offer price for a commodity from outside the Community at the port handling the heaviest volume of trade to the area with the least adequate supply of that commodity. For pork, poultry and eggs, a compound levy is applied which is derived from the difference between EC and world market prices for the feed grain required to produce each kilogram of the product plus 7 percent of the cost (including feed cost) of producing and marketing the domestic product. If the import price plus the compound levy is below established minimum prices, a supplementary levy is applied to bring the price up to the minimum. For beef, fruits and vegetables, and wine, if the import offering price plus duty is below established minimum prices, a levy is applied to bring the price up to the minimum. In all cases the minimum import price is set at a level calculated to raise the cost of imports to the support price for the domestic product in the principal deficit market in the Community. Because the amount of the levy is determined on the basis of the difference between the lowest offer price from any source and the minimum import price, and then is applied

to all imports regardless of origin, shipments arriving with prices higher than the lowest offer price have their landed cost raised above the support price level for the domestic product. Consequently, imported products frequently have their prices increased above those for domestically produced goods. 1/

The height of the EC's variable levy charges is illustrated by the ad valorem incidence of the levies on selected products in 1970 shown in table 7 - D. Because of problems in calculating an ad valorem incidence of variable levies (the frequent and substantial variations in the amount of the levy and insufficient detail in import statistics), the figures given can only be taken as approximate indications. The incidences shown in the table are calculated by using unweighted averages of monthly levies and import prices. Moreover, the variable levy incidence can change substantially over time because of variations in world market prices and in the amount of the levy. For example, in contrast to the data shown in the table, levies on August 1, 1972, were equal to 122 percent of the lowest c.i.f. price for wheat imports, and 84 percent for corn. The products in the list are representative of about \$1.5 billion of the Community's estimated \$1.8 billion of agricultural imports in 1970 subject to variable levies.

---

1/ This description of the determination of the amount of EC variable levies greatly oversimplifies extremely complex arrangements. The reader interested in more accurate details can refer to The Common Agricultural Policy of the European Community, Executive Branch GATT Study No. 12, prepared at the request of the Senate Finance Committee's Subcommittee on International Trade, or to Foreign Agricultural Report No. 55: The European Community's Common Agricultural Policy, issued by the U.S. Department of Agriculture, or to the actual regulations issued by the Community.

Table 7-D.--Ad valorem equivalents of EC variable levies on selected agricultural products in 1970

Product	: Ad valorem : : equivalent :	Product	: Ad valorem : : equivalent :
	: Percent :		: Percent :
Live hogs-----	42.2	Barley-----	69.7
Baby chicks, less than 185 grams-----	3.6	Corn-----	47.4
		Grain sorghum-----	74.0
Beef, frozen, sides-----	<u>1/</u> 33.3	Rice, husked (brown rice)-----	105.6
Pigmeat, carcass/half carcass-----	42.2	Rice, milled, bleached, long-----	181.6
Whole poultry, with giblets-----	33.5		
Turkeys, whole-----	24.1	Wheat flour-----	50.8
Turkey breasts-----	24.1	Wheat groats and meal-----	50.3
Smoked ham-----	42.2		
Canned poultry, 57% or more meat-----	25.7	Lard, edible-----	42.2
		Olive oil, virgin-----	2.0
Milk powder, fat 1.5% or less, no sugar added-----	150.5	Sugar, white, undenatured-----	196.4
Butter, fat 85% or less-----	480.2	Sugar, raw, undenatured-----	133.3
Cheddar cheese-----	133.8	Lactose-----	61.3
Eggs, fresh/preserved-----	66.2		
Eggs, dried, whole without shell-----	82.3	Canned peaches, sugar added-----	<u>1/</u> 4.6
		Fruit cocktail, sugar added-----	<u>1/</u> 4.8
Non-durum wheat-----	101.9		
Durum wheat-----	79.7	Eggs and milk albumin, dried-----	26.7

1/ In addition to the levy, the products are also subject to a customs duty, which in 1970 was 20 percent ad valorem for beef sides, 24.4 percent for canned peaches, and 23.2 percent for fruit cocktail.

Source: Compiled from data furnished by the U.S. Department of Agriculture.

The United Kingdom, Ireland, and Denmark became members of the European Community on January 1, 1973. Under the Treaty of Accession, the new members agreed to accept the EC price and marketing systems for agricultural products and the EC price support levels, over a transition period extending to December 1977. During the transition period, the new members will adjust to the variable levies on imports from third countries, at the same time eliminating import charges on trade between the original EC member states and themselves. In February 1973, the new members installed the EC's Common Agricultural Policy involving guaranteed or support prices, market intervention (price support buying), and variable levies for the major products, and these items became eligible for export subsidy payments. The acceding countries are to adjust in stages 1/ to EC guaranteed prices, by December 31, 1977.

The combination of devices which make up the CAP for the various product groups--some type of variable levy charge to limit or exclude imports and assure minimum price levels for imports which do enter, support of internal prices at high levels, a general absence of production controls, and export subsidies and other artificial measures to remove excess production from the internal market--have produced continuing rises in prices for agricultural products in the Community (with rapidly increasing food costs to the EC consumer), impressive increases in EC production of agricultural products, and an increasing necessity to subsidize the disposal of surplus supplies in the world market.

---

1/ Staged adjustments vary by product and country, with some elements of the CAP adopted on February 1, 1973 without a transition period, and other elements adopted in stages over a transition period; full adjustment is to be completed by January 1, 1978.

Trade impact of EC levies.--The effect of the EC's variable levy system on trade in agricultural products has been pronounced. The removal of nearly all trade barriers to internal EC trade coupled with the application of variable levies to imports from third countries has relegated the United States and other supplying nations to the role of residual suppliers of variable levy products, since they are not permitted to compete in price with domestic products in the EC market. Exporting nations have complained that in addition to being deprived use of this basic and elemental means for competing, their opportunities are further diminished because of uncertainty of the level of the charges and differences in interpretations of regulations among member countries of the Community.

The general trend in EC agricultural trade reveals the impact of the variable levy together with the other companion devices that make up the CAP. While the value of U.S. exports of agricultural products to countries outside the Community grew by 90 percent from 1961 to 1970, exports to EC countries increased by only 43 percent. The 1971 U.S. export value of commodities affected by the levy increased by only 23 percent above the average during 1959-61, compared to a 98 percent gain in commodities not subject to levies; the corresponding gains for 1972 exports amounted to 48 percent and 125 percent, respectively.

Despite the fact that the value of EC purchases of U.S. agricultural commodities has increased since 1961, 1/ the U.S. share of their import market 2/ declined from 14 percent in 1961 to 11 percent in 1970.

---

1/ It should be noted, however, that there were many other controls which severely restricted European imports in these earlier years.

2/ Includes intra-EC imports.

The same is true of other third countries (including the recent new members, the United Kingdom, Ireland, and Denmark) whose share of the EC market declined from 64 to 51 percent. Third countries have found it increasingly difficult to export to the EC and have stepped up their sales efforts in other agricultural markets, thus stiffening competition with U.S. exports in those areas. Meanwhile the share of intra-EC trade in its expanding market increased from 20 percent to 36 percent. The value of intra-EC trade increased almost 2-1/2 times from \$1.8 billion in 1961 to \$6.1 billion in 1970.

An extrapolation based on the level of trade in 1954-61 indicates that U.S. exports to EC countries could have performed considerably better had the variable levy not been in effect. If the same trends had continued, the value of EC imports of U.S. agricultural commodities during 1961-70 would have increased by 150 percent to \$3.0 billion instead of an actual gain of less than 50 percent to \$1.8 billion. Moreover, the intra-EC trade level would have increased 122 percent instead of the actual gain of 238 percent. In less specific terms it seems evident that U.S. exports of agricultural products to the Community would have been considerably better without the CAP.

The severity of the impact will undoubtedly increase as the CAP is extended to the new EC members, the United Kingdom, Ireland, and Denmark, which accounted for \$621 million in U.S. agricultural exports during 1972.

U.S. exports of agricultural products to the EC during 1971 amounted to \$1.8 billion, almost \$750 million above the average level during the three years just prior to application of the variable levy;

during 1972, they amounted to \$2.1 billion (table 7-E). This might be construed to indicate that the existence of the Community has stimulated demand sufficiently to offset the restrictive effects of the levy. However, a commodity-by-commodity analysis reveals that the impact of the CAP has been severe enough on some commodities to jeopardize the overall value of future U.S. agricultural exports. The chart below shows the strong downward trend which has occurred in variable levy product shipments into the Community in contrast to the upward trend of other products.

The principal U.S. agricultural exports to the European Community which have been assessed variable levies are feed grains (corn, grain sorghums, barley, and oats), wheat and wheat flour, rice and poultry.

Table 7-E.--U.S. agricultural exports to the European Community: Value of variable-levy and nonvariable-levy commodities, calendar year averages, 1959-61, 1962-64, 1965-67, and 1968-70; annual 1970, 1971, and 1972

1/ Grains, poultry, and pork were subject to variable levies beginning on July 30, 1962; rice on September 1, 1964; and beef and dairy products on November 1, 1964.

2/ Less than \$0.5 million.

3/ Includes rye, beef, pork, and veal (except variety meats), lard (for food) dairy products, and eggs.

4/ Although fruits and vegetables are subject to supplementary levies, they have only been applied in very recent years and the effect cannot be determined. Therefore, for this analysis they are considered as nonvariable-levy commodities.

5/ Although canned poultry, tallow, and variety meats are subject to variable levies, these cannot exceed the amount of import duties bound in GATT.

6/ Mainly corn gluten feed and meal, which are nonvariable-levy commodities, but may contain small quantities of other corn products, subject to variable levies.

7/ Includes canned poultry, fruit preparations, fruit juices, canned fruits, vegetable oil, and fats.

Source: U.S. Department of Agriculture.

Other products subject to variable levies include rye, veal, pork, lard for food purposes, dairy products, eggs, and sugar. <sup>1/</sup> Table 7-E compares U.S. exports to the Community of specific commodities assessed variable levies with the performance of commodities not assessed with the levies.

The 1968-70 average export level for commodities subject to a variable levy is slightly above the average of the pre-levy period of 1959-61, but had it not been for the sharp increase in exports of one commodity, corn, the increase in variable levy commodities would have been nil. The increased exports of U.S. corn resulted from the demand of a rapidly expanding livestock and poultry industry--a result itself of the CAP--and was accompanied by greatly accelerated corn production in the Community as well as an expansion in intra-EC trade. Exports of rice in 1971 and 1972 were above the pre-levy period, but they were below peak levels attained during the late 1960's. Exports of grain sorghums, barley, oats, and poultry have sustained severe declines below 1959-61 levels. Wheat and wheat flour exports were down in the late 1960's as well as during 1970 and 1971, but by 1972 they had regained the level prior to the levy. The following chart compares annual U.S. export performance of the major variable levy and nonvariable levy product groups.

---

<sup>1/</sup> In addition, beef, wine, and fruit and vegetables are subject to a supplementary levy when the import offering price is below established minimum prices. A levy is also assessed on various products processed from agricultural products; e.g., yogurt, spaghetti, macaroni, and prepared glazings, etc. A levy is also charged on the sugar added content of such items as confectionery, certain chocolate goods, milk crumb and gingerbread; a levy is charged on the flour added content of certain bread and pastries. See appendix table 7-A at the end of this chapter for a list of items subject to the variable levy when imported into the European Community.

# U.S. AGRICULTURAL EXPORTS TO THE EC, BY PRINCIPAL COMMODITIES

The principal agricultural commodities not subject to the EC variable levy include oil seeds, oil cake and meal, tobacco, variety meats, certain corn byproducts, cotton, tallow, and hides and skins. The total value of U.S. exports in 1971 to the Community of commodities not subject to the variable levy <sup>1/</sup> amounted to \$1.4 billion, or some \$680 million above the 1959-61 average; during 1972, they amounted to \$1.6 billion. The export values of these commodities in 1971 and 1972

<sup>1/</sup> Including several items which became subject to variable levies in very recent years. It is too early to determine the impact of the levy on these products and therefore they are included in the non-variable group for this analysis.

represented about three-fourths of the value of U.S. agricultural products exported to the Community in each of these years. The largest increases, by far, have been accounted for by exports of oil seeds, oil cake, and oil meal. These products, plus tobacco, accounted for about 70 percent of the 1971 and 1972 values of exported commodities not subject to the variable levy.

Bindings under the GATT of duties for oil seeds and oil seed products which were agreed to by the European Community during the Dillon Round of tariff negotiations have prevented the inclusion of these products in the variable levy system. Otherwise, in all probability, these products would have been included since certain of these oil seeds are domestically subsidized and production is increasing. Exports during 1971 were valued at \$805 million, some \$655 million above the 1959-61 average; in 1972, they amounted to \$914 million.

U.S. exports of tobacco to the Community benefitted from two circumstances: Rising demand for U.S. qualities and trade sanctions by the United Nations against Rhodesia. Exports of tobacco increased from an average of \$89 million during the 1959-61 period to \$162 million in 1971 and \$169 million in 1972. CAP regulations have recently come into effect on tobacco which will tend to insulate the EC market (including associated areas of Africa, as well as Greece and Turkey) from world prices and have a significant effect on EC production. An important factor in possibly limiting future U.S. exports is a "buyer's premium" paid to manufacturers who buy EC produced tobacco. A proposed percentage excise tax would also discriminate against high quality U.S. products.

U.S. exports of variety meat products to the European Community amounted to \$51 million during 1971, or more than 3-1/2 times the 1959-61 level; during 1972, exports amounted to \$58 million. Although such products are subject to variable levies, the combined duty and levy cannot exceed certain rates bound in the GATT. U.S. production is competitively priced in the Community and exports are expected to increase.

Substantial growth in the EC livestock market and levies on grain imports stimulated large exports of corn byproducts for the mixed feed industry (\$34 million in 1971 and \$52 million in 1972 compared to \$1 million in 1959-61). Exports are expected to continue to increase.

In contrast to larger sales to the Community since 1959-61 of most commodities not subject to variable levies, declines have taken place in exports of raw cotton and tallow. Cotton has sustained the most severe reduction (from \$217 million in 1959-61 to \$53 million in 1971 and \$61 million in 1972) primarily due to expanded use of manmade fibers coupled with the reduction in U.S. production and larger foreign cotton output. Demand for U.S. tallow is expected to again increase and exports to the European Community should recover the slight declines registered in recent years. Hides and skins have already shown a significant increase in 1972 (\$54 million) after having declined to \$18 million in 1970. Exports had been \$22 million during the 1959-61 period.

#### Variable levies in the United Kingdom

From 1947 through 1971, the underlying feature of the United Kingdom's agricultural policy was a deficiency payment to farmers to

compensate for any difference between the price realized on the market and an established guaranteed price. Domestically-produced commodities competed in the market with imported products, on which there were relatively low duties, and under this plan, market prices remained relatively low.

Movement away from the deficiency payment system began in 1964, when modifications were introduced into the grain program, primarily to reduce costs to the government. Minimum import prices were established, and incorporated in a grains arrangement which the United Kingdom entered into with Argentina, Australia, Canada, and the United States. The arrangement provided for the use of levies to protect the United Kingdom market from suppliers willing to sell below the minimum prices. After 1964, most other suppliers became parties to the arrangement. <sup>1/</sup> The minimum prices were set at levels normally slightly below world prices. The ad valorem equivalent of levies collected on most products were nominal (for example, less than 1 percent on wheat, wheat flour, and corn).

Under the system which the United Kingdom installed, the uncertainty factor of the variable levy was eased somewhat by the method of application. Anticipated levels of future charges were announced on which forward contracts could be registered by the Ministry of Agriculture. A registration fee was paid and a certificate issued

---

<sup>1/</sup> The series of agreements on grains (negotiated in 1964, 1967, and 1971) was separate from the international wheat agreements, but wheat, as well as other grains, was covered. The agreements were terminated on December 29, 1972, prior to the entry of the United Kingdom into the European Community.

to the importer quoting the rate of levy appropriate to the month of shipment. If the actual rate of levy in force at the time of import differed from the certified quotation, the importer paid whichever rate was lower.

In 1971, in light of the prospective entry of the United Kingdom into the European Community and the need to harmonize the United Kingdom agricultural support system with that of the Community, fundamental changes were made in the United Kingdom's agricultural policy involving a complete shift from the deficiency payment system to a system of higher tariffs and minimum import prices using variable levies on imports. The use of variable levies was thus extended to such commodities as beef and veal, certain dairy products, eggs, and poultry meat.

As already mentioned above, the United Kingdom, in the Treaty of Accession to the Community, has agreed to accept the Community's Common Agricultural Policy, thus bringing under a variable levy all products subject to this device under the CAP. During the five-year transition to complete conformance to EC agricultural regulations, the United Kingdom will be making staged upward adjustments in its support prices to reach the EC price support level, with corresponding adjustments in its variable levy charges. This will entail substantial increases in protective charges levied by the United Kingdom on imports of most agricultural products from non-EC sources from the relatively nominal levels of the past few years to levels of the Community (see table of ad valorem equivalents under discussion of the EC variable levy). The

shift to the Common Agricultural Policy raises the level of protection on over 80 percent of U.S. agricultural exports to the United Kingdom. 1/

According to a study by the U.S. Department of Agriculture, 2/ the overall import requirements of the United Kingdom will be significantly reduced by 1975 as a result of their entry into the European Community. A Michigan State University study indicates that expansion of intra-EC trade resulting from EC enlargement will be extensive and the potential shifts in trading patterns will be substantial. "This, along with a projected rate of increase in output greater than the rates of increase in utilization will result in diminishing export opportunities for third country suppliers..." 3/

U.S. agricultural exports to the United Kingdom during 1968-70, after the modification of their deficiency payment system of grains,

---

1/ United Kingdom tariff rates on several of the items on which protection is being increased have been bound under the GATT. The GATT rules pertaining to the formation of a customs union state that the duties and other regulations of commerce imposed in the union shall not on the whole be higher or more restrictive than the general incidence of duties and regulations applicable in the constituent territories prior to formation of the union. Under the provisions of Article XXIV of the GATT, a detailed examination and negotiation is being conducted concerning the enlargement of the European Community. The EC Council has announced that its position in these negotiations is that any increase in protection (largely on agricultural products) in the United Kingdom and other acceding countries is compensated by reductions in the acceding countries' tariff rates (chiefly on industrial products) to the generally lower levels of the Common External Tariff.

2/ Summary of United Kingdom: Projected Level of Demand, Supply, and Imports of Agricultural Products, 1970, 1975, and 1980, ERS Foreign 248, U.S. Department of Agriculture, July 1969.

3/ The Impact on U.S. Agricultural Trade of the Accession of the United Kingdom, Ireland, Denmark, and Norway to the European Economic Community, research report No. 11, Institute of International Agriculture, Michigan State University, 1971.

averaged \$382 million, 15 percent below the 1958-60 average level. U.S. exports during 1971 amounted to \$438 million and accounted for about 9 percent of agricultural product imports by the United Kingdom. Some of the most important U.S. export items to the United Kingdom face declines. Among these are beef, milk and milk products, lard, sugar, wheat, feed grains, and certain fruit. Indeed, as indicated by the Michigan State University research study, it is entirely possible that the United Kingdom's entry into the European Community could bring about self sufficiency in beef and veal and their deficit in cereals might not only be reduced, but a small surplus could appear. Furthermore, the incentives of the CAP could result in the United Kingdom becoming a net exporter of pork, poultry, and eggs.

#### Variable levies imposed by other countries

Austria.--Variable levies are applied to several animals and certain products thereof, poultry, certain tuber or root vegetables, certain cereal grains and flour or meal thereof (except rice), sugar beets, certain animal fats and meat preparations, sugar, molasses, and confectionery, chocolate and certain products thereof, tapioca, certain pastries, jams and jellies, animal feeds, and chemical products containing agricultural materials. Incomplete data on the amount of levies collected on Austrian imports in 1968 indicate that the ad valorem incidence of the various levies ranged as follows: Fresh and frozen meat, 4-40 percent; cheese, 0-23 percent; wheat, 18 percent; corn,

50 percent; flour and other milling products, 24-95 percent; prepared or preserved meats, 30-40 percent; sugar and confectioneries, 24-148 percent. The levies act to exclude U.S. exports. For example, the U.S. Foreign Agricultural Services reported in 1972 that if U.S. chicken meat could be delivered to Austria without the import levy, the competitive advantage now enjoyed there by non-U.S. products would be eliminated. The United States supplied only 2.3 percent of Austria's chicken imports in 1971.

Sales of U.S. agricultural commodities in Austria during 1971 amounted to \$10 million, some \$3 million less than during 1966, but \$2 million more than the 1967-70 average; in 1972 sales amounted to \$11 million. The largest U.S. export to Austria, tobacco, is not assessed variable levies. Other items which represent significant U.S. sales to Austria include unmilled corn, and prepared fruits and nuts.

Denmark.--In its programs to improve farm income, Denmark has emphasized quality production in agricultural products and evolved a highly integrated system of production and marketing. Prior to its accession to the European Community, variable import levies to protect these programs were applied to imports of milk powder for animal feed, wheat, rye, barley, oats, corn, millet and grain sorghum, and certain cereal flour and meal. In a recent year, the ad valorem incidence of the levy on wheat was 27 percent; on corn, 15 percent; and on other grains, from 17 to 39 percent. As a new member of the European Community, Denmark has begun the 5-year process of conforming its agricultural program to the EC's Common Agricultural Policy, under which

variable levies will be brought into line with those of the Community. According to the U.S. Foreign Agricultural Services, Denmark would have incurred a \$750 million loss annually if she had remained outside the enlarged Community. The consequences for Denmark of nonmembership would have been a gradual cutback in agricultural production to a level of home-market self-sufficiency.

The total value of U.S. exports of agricultural commodities to Denmark was \$10<sup>4</sup> million in 1971, some \$18 million above 1966, and \$27 million more than the 1967-70 averages; in 1972 exports amounted to \$102 million. Tobacco and soybeans, which are not subject to variable levies, are by far the leading commodities shipped to Denmark by the United States.

Finland.--Variable levies are applied to imports of certain types of meat, dairy products, corn, fats and oils, prepared foodstuffs, food residues, and oil cake. In a recent year, the ad valorem incidence of the Finnish levies were as follows: Fresh or frozen meat, 4-53 percent; dairy products, 9-183 percent; corn, 56 percent; fats and oils, 0-328 percent; prepared meats, 21-142 percent. Efforts are under way to liberalize trade in agricultural commodities with EFTA countries, and Finland has introduced legislation which would eliminate this trade from the import levy charge.

Total exports of U.S. agricultural commodities to Finland in 1971 amounted to \$13 million, some \$3 million less than in 1966, but about \$1 million above the 1967-70 average; in 1972 exports amounted to \$16

million. Tobacco and dried fruit, which are not subject to variable levies, account for the largest part of U.S. agricultural exports to Finland.

Greece.--A variable levy is applied to imports of poultry meat and (since August 1971) dry milk. Poultry meat imports into Greece are subject to an import duty and a variable charge, the total incidence of which in a recent year was 30 percent. About one-sixth of this amount was attributable to the variable levy. Frozen broiler imports into Greece during 1971 were more than 40 percent below the previous year, with those from the United States down by 58 percent. The decline has been attributed to increased domestic production, under the protection of high import levies. The rationale given for the imposition of the levy on dry milk was to encourage use of domestic milk and discourage illegal addition of dry milk (along with water) to fresh milk.

Spain.--Since 1963, variable levies have been applied to various meats, poultry, fish, vegetables, fruit, cereals, oil seeds, vegetable oil, and fish meal. Satisfactory data on the ad valorem incidences of these levies are not available.

Sales of U.S. agricultural commodities to Spain in 1971 amounted to \$180 million, some \$10 million less than during 1966 and \$6 million less than the 1967-70 average; in 1972 exports amounted to \$300 million. Soybeans, the principal U.S. agricultural export to Spain, were not subject to a variable levy until the fall of 1973.

Sweden.--Variable levies are applied to various live animals, certain meats, fish, dairy products, vegetables, cereals (except rice), flour and meal and certain products thereof, certain oil seeds, animal and vegetable fats and oils, prepared foodstuffs, sugar and molasses, chocolate, certain food and industry residues, and certain miscellaneous chemical products containing farm commodities. 1/ The levies serve to protect Sweden's domestic production and at the same time provide revenue to help subsidize exports of agricultural commodities. Countries of the European Free Trade Association are exempt from the levies on some products, although agricultural commodities are not generally included in the EFTA Agreement.

The levels of charges are reviewed and are subject to change periodically as domestic and world prices change. A minimum price acts as a trigger for the application of the variable tax. For most products the levies are fixed as long as domestic prices remain within pre-determined price limits. The charges are generally made according to the net weight of an item rather than the actual relationship of the landed value to the domestic price as in the case with most other countries' variable levies. Therefore, not all imports of a particular product are raised to the same level and some competition between exporters is retained. However, the levy is sometimes so high that the imported product is unable to compete with the domestic product (e.g., the levy

---

1/ In addition to the variable levy, many of these products are, upon importation, also subject to "compensatory fees" which are import charges corresponding to charges on domestic production in Sweden (e.g., slaughter fees, manufacturing fees, etc.).

on corn has recently been \$66 per metric ton) thus relegating importers to a position of residual suppliers. Illustrative approximate ad valorem incidences of the Swedish variable levy charges in a recent year are as follows: Fresh or frozen meat, 0-124 percent; dairy products, 5-183 percent; fresh, frozen or dried vegetables, 0-212 percent; grains, 0-110 percent; milled grains, 0-133 percent; fats and oils, 0-120 percent; prepared meats, 0-78 percent; fruit juices, 20 percent.

Sales of U.S. agricultural commodities to Sweden in 1971 amounted to \$57 million, some \$4 million above the 1967-70 average but some \$4 million below the level of 1966; in 1972 exports amounted to \$58 million. Fruit, fruit preparations, and tobacco are by far, the principal U.S. agricultural exports to Sweden. Tobacco is not subject to a variable levy.

Switzerland.--Variable levies are applied to certain live animals; meats, fish, dairy products, leguminous vegetables, cereals, certain oil seeds, sugar beets, forage, certain animal fats, certain vegetable oils, prepared meats, cocoa shells and husks and waste, certain wines, certain residues from food industries, prepared animal fodders, and straw and hay for animal feed. Satisfactory representative data on the level of the variable levy charges separate from other fixed charges assessed on imports of these products are not available.

Sales of U.S. agricultural commodities to Switzerland in 1971 amounted to \$83 million, some \$12 million above 1966, and \$11 million above the 1967-70 average; in 1972 exports amounted to \$113 million. Tobacco, which is not subject to a variable levy, is by far the largest U.S. export commodity to Switzerland.

## Border Tax Adjustments for Internal Taxes

In the Tariff Commission's survey of trade barriers, vehement protests were received from important segments of U.S. industry against "border taxes" levied on imports by many foreign countries, and particularly European nations. Such charges have become one of the most contentious issues in the general public's discussion of trade barriers. The subject is one of the most complex and difficult in the NTB field.

"Border taxes" defined

When the American businessman speaks of "border taxes", he generally has in mind the charges, other than import duties, which countries in continental Europe have been collecting for many years on their imports, simultaneously with import duties, to offset or compensate for national general consumption taxes (particularly turnover taxes of the cascade and value-added type) 1/ which are applied

---

1/ "Turnover" taxes are taxes levied on the transfer of products from one owner to another. There are three types:

1. Single-stage taxes, which are levied at a single stage of the production or distribution process (e.g., manufacturers excise taxes, retail sales taxes);
2. Cascade taxes, which are levied at each transfer of a product on the product's cumulative value without credit for taxes paid at any prior state; and
3. Value-added taxes, which are also levied at each transfer of a product, but with credit for taxes on the preceding transfer until the product is sold to the final customer, at which point no credit is given. Allowing credit for prior taxes leaves as the tax base the value added in the production process, which goes to capital as profits and labor as wages.

to domestic products. His concept may also extend to the taxing nation's "refund" of such taxes on its exports.

In international considerations of the border tax adjustment issue, a more comprehensive definition has been used. In order to deal with the full range of problems which these tax adjustments present, it has been considered most convenient to define border tax adjustments as any fiscal measure which enables imported products to be charged with some or all of a tax charged in the importing country on similar domestic products and which enables exported products to be relieved of some or all of the tax charged in the exporting country on domestic products. Thus, "border tax adjustments" include the imposition of taxes on imports not only at the time of importation, but also at any subsequent point in the distribution channel, and any exemption from tax on exports in addition to the repayment, upon exportation, of taxes already collected on products which are exported.

This general definition of border tax adjustment is used for this report. Under this definition, virtually all countries, including the United States, make some border tax adjustments on their imports and exports.

#### The "border tax" issue

Under fairly longstanding international practices, which were incorporated into the General Agreement on Tariffs and Trade when it was drafted, indirect taxes (taxes usually referred to as consumption taxes or taxes on products) are considered eligible for border tax

adjustments, while direct taxes such as income taxes, profits taxes, payroll taxes, and social security charges are not regarded as eligible. 1/

Foreign countries rely more heavily than the United States does upon indirect (consumption) taxes for government revenue. In foreign tax systems, the major consumption taxes are generally types which, with respect to imports, are collected when the goods enter the country, rather than at later stages of distribution. Therefore, in addition to the regular import duties, products imported by these countries are immediately assessed with taxes which are both substantial 2/ and highly conspicuous. Moreover, products exported from these countries are shipped abroad at prices substantially below the internal domestic price by virtue of the fact that the consumption tax is not collected on the exported goods (or will be refunded if it has been collected).

On the other hand, very few products imported into the United States are subject to a border tax adjustment at the time of entry. (The most important are alcoholic beverages, tobacco products, gasoline

---

1/ A full discussion of GATT provisions on this matter is found in "Tax Adjustments in International Trade: GATT provisions and EEC Practices," Executive Branch GATT Study No. 1., Committee on Finance, U.S. Senate, April, 1973.

2/ In France, for example, a standard effective rate of 23 percent applies to most goods; in West Germany, most goods are taxed at the rate of 11 percent. Before the United Kingdom changed to a value-added tax in 1973, the United Kingdom purchase tax (which could be assessed either at the time of importation or at a later stage of distribution, depending upon the method of distribution) was levied at four rates: 12.5 percent, 20 percent, 33 1/3 percent and 50 percent; a wide range of consumers' home products and automobiles paid the 33 1/3 percent rate; jewelry, furs, gold watches, and similar articles paid the 50 percent rate.

and lubricating oil.) Most U.S. border tax adjustments are found later in the distribution channel, and occur principally as state and local retail sales taxes. For all but a very few U.S. products, the differential between domestic and export prices which is attributable to the exemption of exports from internal consumption taxes is substantially lower than the price differential found in products of most other major trading nations resulting from the exemption of their exports from their domestic consumption taxes. 1/

A large percentage of American businessmen regard this situation as grossly unfair to them in their efforts to compete with foreign producers both in markets abroad and in the United States. Their general complaint is that when selling abroad they bear the burden of the substantial U.S. direct taxes (corporate income taxes, etc.) plus the significant indirect taxes of the foreign country; when selling in the United States, the imported product of their foreign competitors has been relieved of a substantial part of its national tax burden through the border tax adjustment process, and bears none of the U.S. direct taxes.

---

1/ Border tax adjustments in Europe operate similarly to the various state sales taxes in the United States. If an article imported into the United States is sold in a state with a sales tax, the seller adds the tax to the price and passes it on to the consumer. If a domestic product is exported to another state or to a foreign country, no sales tax is charged by the exporting state. (Article I, section 9, of the U.S. Constitution prohibits the laying of a tax or duty on articles exported from any state.)

Thus, the United States does, in effect have widespread "border tax adjustments" on traded goods, since sales taxes are charged on imported goods when sold and are not paid on goods destined for export. The difference is that in Europe the taxes are actually levied as the imported goods cross the border, while in the United States they are paid usually at the time of final sale. Another important difference is that most of the European tax rates are substantially higher than those in the United States.

One U.S. corporate executive describes the situation thusly:

...The use of indirect taxes by our major trading partners disadvantages the United States which relies primarily on direct taxes as the major source of national receipts.

The disadvantage to the U.S. manufacturer is very substantial. A European or Japanese manufacturer absorbs in his costs the domestic taxes imposed in his country on products sold for domestic consumption, but his costs are reduced on products exported because a substantial portion of these taxes is rebated when he sells the product for export. When these exports enter the U.S., the foreign manufacturer does not have to pick up any part of the U.S. tax bill, since the U.S. does not have a border tax. Therefore, the foreign manufacturer's costs are favorably affected by the remission of part of his domestic tax burden, while his costs reflect no part of the U.S. tax burden.

The U.S. manufacturer faces an opposite situation. His U.S. tax costs are not reduced when he exports since we have no border tax rebates. In addition, his export costs are increased by the obligation to pay at the border of the foreign country a portion of a foreign country's tax burden in the amount of the border tax imposed.

The unfairness to the United States of such a situation is obvious and serious, and, in my judgment, is a major reason why the U.S. trade balance will not improve. 1/

The view of the European businessman is only partially at variance with that of the American. The European, having his own product subject to rather substantial consumption taxes, regards the assessment of the same tax upon imports as fair and equitable. 2/ However, he tends to look upon the remission of the tax on exports as a bonus or subsidy for his operations. For example, a Parisian clothier,

---

1/ Remarks by Fred J. Borch, Chairman of the Board, General Electric Company in "United States International Economic Policy in an Interdependent World," a report to the President submitted by the Commission on International Trade and Investment Policy, July 1, 1971, page 330.

2/ It is perhaps noteworthy that those American businessmen whose products have been subject to significant Federal excise taxes also share this view, and that U.S. producers of these products (such as automobiles, alcoholic beverages, and tobacco products) usually do not consider border tax adjustments discriminatory.

with a branch store in Washington, D.C., has advertised in a Washington newspaper that he is able to sell his French-made clothing in Washington at approximately the same price as in his Paris store because "the French government pays a 23 percent subsidy on exports of French products," (meaning that the 23 percent value-added tax levied by the French government is not collected on exports).

In sum, the U.S. businessman feels that his cost of entry into foreign markets, and hence his competitive position, is prejudiced by the fact that the price of his product bears both U.S. and foreign taxes, while the cost of entry of foreign products into the U.S. market is lower, and their competitive position enhanced, by the fact that they bear little, if any, foreign taxes and no U.S. taxes.

Professional economists generally disagree with this position of the business community on border tax adjustments. Economists argue that the link between border tax adjustments and trade is less direct, and any distortion of competitive conditions less severe, than some businessmen claim. Most economists agree that there may possibly be some temporary adverse trade effects for foreign suppliers resulting from border tax adjustments. However, the academic research which has been done on the subject has been inconclusive.

Under a particular set of market conditions, foreign border tax adjustments may prejudice the competitive position of individual U.S. products (or individual U.S. producers). The extent to which foreign border tax adjustments may create a disadvantageous competitive situation for U.S. producers (which, in any event, would be limited to the

short run) 1/ depends entirely upon the extent to which direct taxes, such as profits taxes, are actually shifted forward to be borne by the consumer rather than the producer, and the extent to which indirect consumption taxes are shifted backward to be borne by the producer rather than the consumer.

Tax shifting is a matter on which there is much theory but an abysmal absence of empirical knowledge. Most current economic theory recognizes that there may be some backward shifting of general consumption taxes onto the factors of production under certain circumstances. However, there is hardly any consensus on the possibility of shifting profits taxes forward to the consumer, and present theory on this point has been described by one writer as "in utter disarray." 2/ Views range from absolutely no shifting forward to more than a complete shifting forward! However, it is generally recognized that if tax shifting for either consumption or profits taxes does take place, the degree to which the tax may be shifted depends on general economic factors in the relevant country such as the demand for the product, actions of the monetary and fiscal authorities, the stage of the business cycle, and the extent to which the producers are oligopolistic. Also, economists argue that any trade disturbances caused by internal tax changes plus changes in border tax adjustments are short-run phenomena because trade imbalances usually lead to some form of compensatory adjustment (exchange rate adjustments, inflationary pressures, etc.)

---

1/ In the long run, other economic adjustments will take place which counterbalance or even the disadvantage.

2/ James A. McNamara, Tax Adjustments in International Trade, the Border Tax Dispute, in the Journal of Maritime Law, January, 1972.

and that permanent differences in tax rates and direct-indirect tax structures among countries do not result in permanent trade distortions. 1/

The differences between businessmen and economists on the border tax issue arise in part because of their differing points of view on the subject. The economist looks at the overall effect of border tax adjustments on the economy as a whole, whereas the businessman may view the question primarily from the experience of his individual product, which may differ greatly from the experience of the economy as a whole.

The tax adjustment problem has been considered and debated internationally in the OECD, the GATT and in bilateral discussions between countries. A major interest of the United States in these discussions was to explore possible ways of changing current border tax adjustment practices to compensate for the imperfections in the present arrangement. The general result that emerged from all of these discussions has been a consensus that, at least for the present, no one seems able to devise a more practical or preferable alternative to the existing GATT rules. The situation has been summed up thusly: "... the tax adjustment problem is not imaginary. It may well be, however, that the existence of an arrangement preferable to the present GATT rules is imaginary; alternatives to the GATT rules are not promising." 2/

---

1/ Long-term differences in tax rates and total tax burdens do create incentives for capital to migrate from higher tax to lower tax countries; however, this effect is not the direct subject of this report.

2/ Paul Wonnacott, "Tax Adjustments on Internationally Traded Goods," in United States International Economic Policy in an Interdependent World, Washington, D.C. July 1971 (The Williams Commission Report).

The remainder of this discussion is chiefly in terms of the macro effects of border tax adjustments, rather than the effect which they may have on individual products.

The purpose and operation of border tax adjustments  
in the tax system

The rationale for border tax adjustments is to compensate on traded goods for the price effects of an internal tax. For a century or more, the working assumption of policymakers has been that indirect taxes will be very largely, if not completely, passed along to the final consumer, in the form of price increases if the producer pays the tax, or in the form of a surcharge on sales if the tax is collected at the time of sale. This position rests upon the teachings of some classical and turn-of-the-century economists that all consumption taxes are fully reflected in the final price of the product, or in other words, fully shifted forward to the consumer.

Historical evidence can be found to indicate that there is a link between changes in indirect taxes and changes in general price levels. Certainly there is the possibility of full forward shifting, although this may not occur in every case. If it is assumed for the moment that indirect taxes are fully passed on to the consumer, the rationale for border tax adjustments, as they are commonly used, can be explained by a simplified example.

An example of a trade neutral border tax adjustment.--Germany has a value-added tax (VAT) of 11 percent. Suppose product X sells on the world market for \$100 c.i.f. at a German port and that Germany has a

tariff of 10 percent on that product, bringing the landed price of imports up to \$110. Before the VAT was instituted, a German manufacturer could compete with the imported product by making and selling the same article for \$110 on the German market. However, after the VAT was enacted, he must pay an 11 percent tax on his sales of the product. Under our assumption that the 11 percent VAT will be included in the final price to the consumer, the German producer could not compete with imports unless they too were charged the 11 percent VAT as a border tax adjustment. Consequently, all goods destined for the German market (both domestic and imported) are charged the same VAT. <sup>1/</sup> The German buyer will select between the domestic and imported products on the basis of price, quality, etc., but not on the basis of any final price differential caused by the German value-added tax system.

Now suppose a large German export item, product Y, is able to compete on the world market when selling for \$200 f.o.b. at a German port and that there is no German tariff on the article. Because of the 11 percent VAT, a German buyer would pay \$222 for product Y, whether it is imported or domestic. These conditions would mean that a German producer, selling either to the domestic or export market, would have to manufacture and sell product Y in Germany for \$200 to compete with imports. If the German producer is not to be penalized in the external world market, the 11 percent value-added tax must not be collected on

---

<sup>1/</sup> This is the "destination principle" of taxation where, for taxes associated with products, all goods destined for domestic consumption are taxed. Besides being trade neutral (if the exact border tax adjustment is made), the tax coverage will be complete because all individuals have all of their consumption taxed whether the products purchased are of domestic or foreign origin.

his exports. Thus, the VAT is not collected (or is rebated, if already collected) on goods destined for foreign markets.

If the forward price shifting assumptions are correct, the German VAT system with its associated border tax adjustments should result in German domestic price levels (to the final buyer) being about 11 percent above the world price level at the German border, inclusive of the German tariff. <sup>1/</sup> Under this situation, a foreign exporter to Germany could not complain about the 11 percent tax adjustment on his product at the German border since an equivalent article bought in the German market from a German producer bears the same 11 percent tax. Also, foreign producers could not complain about unfair competition on world markets from German exports which have been relieved of the 11 percent internal German consumption tax. In other words, the tax is totally neutral insofar as its having a discriminatory effect on trade.

Examples of border tax adjustments which distort trade.--In the light of this hypothetical example predicated on the theory that consumption taxes are totally paid by the ultimate consumer, two situations are immediately apparent where border tax adjustments would not have a neutral effect on trade. One, of course, is the obvious case when a different rate is actually applied to imports and exports than is applied to domestic products consumed in the home market. The second,

---

<sup>1/</sup> Any comparison between domestic and foreign prices must be made through an exchange rate. The assumption here is that German domestic prices would exceed foreign prices by 11 percent at the given exchange rate (which presumably is the same as that which would have existed without an 11 percent internal tax because the border tax adjustment compensated perfectly for any trade effects that the tax might have caused).

less obvious, situation is when the mix of economic circumstances is such that the consumption tax is not totally shifted forward to the consumer. <sup>1/</sup>

In both of these cases, the border tax adjustment does not equal the domestic price increase (the forward shifting of the tax) that occurred when the internal consumption tax was instituted, and if no other conditions in the economy have changed (e.g., changes in the exchange rate for the nation's currency), a trade distortion may result. However, its magnitude will not depend upon the magnitude of the indirect tax or the border tax adjustment, but on the magnitude of the difference between the border tax adjustment and the domestic price increase at the time of the institution of the indirect tax. The German example can be used again to illustrate the two ways this could happen.

An example of trade distortion because the border tax adjustment does not equal the domestic tax rate.---Suppose Germany imposed an 11 percent VAT but made a 13 percent tax adjustment at the border. Assume domestic prices rose by 11 percent. This would mean that a domestic buyer would tend to choose the domestic product over the imported one

---

<sup>1/</sup> A third case where some would argue trade distortion in connection with border tax adjustments is where indirect tax rates differ on the same products in different countries. For example, if the consumption tax of a particular product is higher in country A than in country B, some in country B would argue trade discrimination because the higher tax in country A discourages consumption and, therefore, the exports of B's product to A. However, this case is not the traditional border tax adjustment problem. Any problem arising from such a tax rate difference lies more in the area of disagreement in countries' values of what economic activities and/or consumption should be encouraged or discouraged by taxation.

because the tax would be 2 percent greater on the imported product. Similarly, if a German exporter were rebated 13 percent, he would be able to sell at 2 percent below world price levels and would be receiving an export subsidy. This procedure would have roughly the same effect on German trade as a 2 percent devaluation of the deutsch mark. 1/ If the border tax adjustment was less than the internal tax (as has happened) of course the trade distortion would be in the opposite direction: German imports would be assisted and exports penalized. In the situation where the border tax adjustment exceeds the internal tax, the foreign businessman could indeed complain about the unfairness of the German border tax adjustment, but he would have to acknowledge that the unfairness was measured by the 2 percent differential between the VAT and the border tax adjustment rather than the 11 percent VAT. In the situation where the border tax is less than the internal tax, the German businessman would have cause to complain. 2/

---

1/ This would assume the VAT was applied to all goods and services at the same rate.

2/ In this latter case the domestic consumer would be able to escape part of the tax burden by buying imports. In the former case where the border tax adjustment exceeded the domestic tax rate, the domestic consumer who used imports would have a total tax burden greater than the 11 percent tax rate.

This illustrates a general principle regarding the relationship between border tax adjustments, internal taxes, and the total tax burden of individuals earning and spending their incomes in the taxing country. A tax covering all consumption (an indirect tax) or a tax covering all income (a direct tax) or a combination of both taxes which allows no escape is trade neutral; a tax which allows some escape of the burden or which imposes a burden greater than the tax rate is not trade neutral. For example, if individuals can escape part of a consumption tax by buying imports not fully covered by a border tax adjustment, the country's trade balance will suffer (imports being relatively cheaper will grow while exports being priced above the world prices will decline). On the other hand, a tax and border tax adjustment which gives a trade-price advantage to a country puts a tax burden on the domestic taxpayer that exceeds the tax rate (as previously illustrated).

The first case of a valid argument that border tax adjustments may distort trade was particularly relevant when many European countries relied on the cascade tax as their chief form of indirect taxation. <sup>1/</sup> Turnover taxes were paid whenever a product was sold from one firm to another on the cumulative value of the product without credit for tax paid at any prior stage and, therefore, the burden of tax carried on goods depended on the degree of vertical integration of firms in the total production process. Since border tax adjustments were to be allowed for the total tax burden on domestic goods, the amount of the adjustment varied from product to product. Various averaging methods were used in different countries to calculate the total indirect tax burden carried by various domestic products, and thereby determine the rate to be applied in border tax adjustment.

Even the most fair minded assessments under such a system were bound to result in hidden subsidies for some goods and hidden tariffs for others. Depending upon the balance of these opposing forces, the net effects on the entire economy would be like either a currency devaluation or revaluation. This problem, associated with a cascade tax system, is disappearing as most of the major European countries convert

---

<sup>1/</sup> France has had a value-added tax since 1954, but most other countries in continental Europe had a cascade form of tax until fairly recently. Under a 1964 decision of the Council of Ministers of the European Community, member states were to harmonize their tax systems by the adoption of a VAT by 1970. This schedule was met by West Germany (1968), Netherlands (1969), and Luxembourg (1970). Belgium did not move to a VAT until 1971 and Italy until 1972. Austria, Denmark, Ireland, Norway, Sweden, and the United Kingdom have also adopted the VAT.

to the value-added tax under which the border tax rate adjustment exactly equals the VAT rate. 1/

An example of trade distortion from incomplete forward tax shifting.--To examine the second case where border tax adjustments may distort trade (because the indirect tax is not totally shifted forward into final price increases), suppose again the example where the 11 percent VAT is matched by an 11 percent border tax. In this case, however, assume that the German government manages to keep the German price rise following imposition of the VAT to 9 percent by monetary and/or fiscal policies which depress wages (or their increases) 2 percent, so that the firms still make acceptable profits under a 9 percent (tax inclusive) price to the consumer. 2/ The German consumer will again choose the domestic product because it costs only 9 percent more after the institution of the VAT, while the import costs 11 percent more. The difference of 2 percent acts like a tariff on imports. Also, since the German exporter has had his wage costs depressed by 2 percent in relation to foreign wage costs, he has a 2 percent price advantage on world markets for his VAT-free exports. This situation would have an

---

1/ Numerous cases can be cited where foreign suppliers feel the "border tax adjustment" applied to their product (either at the border or at a subsequent stage of distribution) is greater than the internal tax on the domestic product with which they are competing. Such inequalities usually arise when tax rate structures differentiate between products, or classes of a product, and have the ultimate result of different tax rates on domestic and foreign products which are competitive at least to some degree. For example, in many countries of the world, tax rates on automobiles are, for various reasons, structured to discriminate against the higher horsepower, larger cars. Another case is found in the U.S. method of assessing federal excise taxes on distilled spirits, under which, although a single rate is applicable to foreign and domestic spirits, the foreign spirits, if bottled abroad, bear a heavier tax.

2/ The deflationary policy would probably not lower wages 2 percent in the real world, but would prevent them from rising as fast as they were in the predeflationary situation.

effect on the trade balance similar to a 2 percent devaluation (or an import tariff plus an export subsidy). 1/

In this second example of trade distortion from a border tax adjustment, it is clear again that the measure of the discriminatory price effect on trade is not the 11 percent rate of the border tax adjustment, but rather the 2 percentage points difference between the border tax and the domestic price rise inclusive of the VAT and other economic effects. Even though the price effect is small, however, it can have quite an impact on trade if it covers most physical goods that cross borders in trade. Nevertheless, as will be seen later, there are good arguments that over a longer period of time "devaluation" effects of border tax adjustments in conjunction with other policies may be canceled out by other changes in the economy. 2/ It is also worthwhile noting that if indirect tax increases are prevented from being passed on in price increases by deflationary policies of the government, domestic producers, even though possibly benefitting from

---

1/ If Germans bought the same quantities of imports under the new 11 percent tax rate, their total tax burden would exceed 11 percent. For that part of income spent on domestic goods, 2 percent is foregone in terms of (after tax) lowered wages and profits and 9 percent is taxed away as domestic goods are consumed, giving a total tax burden of 11 percent on this portion of their income. However, for that portion of income spent on imports, the 2 percent is foregone on the income side while 11 percent is taxed away on expenditures for imports for a total burden of 13 percent. Hence, as long as some imports are purchased under this system, the total tax burden will exceed 11 percent.

2/ For example, a large price-trade advantage would cause a trade surplus which might necessitate a revaluation of the currency or devaluations of currencies of trading partners. Such an exchange rate change would neutralize the temporary trade advantage caused by the internal tax and mismatched border tax adjustment. Another possibility might be that a large trade surplus, by earning large amounts of foreign exchange, would increase the money supply (in the absence of neutralizing action by the monetary authorities). This would inflate domestic prices, erasing the trade-price advantage (i.e., the backward shifting) that caused the trade surplus.

a small devaluation-like effect of the border tax, also may suffer adverse effects from the government's deflationary policies which prevented the price rise.

"Cost of entry" analysis applied to border tax adjustments.---Many of the briefs concerning border tax adjustments which were submitted to the Tariff Commission in the present investigation claimed to show, for a selected sample of products, that the "cost of entry" into European countries from the United States is substantially greater because of border tax adjustments than the "cost of entry" of European goods into the U.S. market, and consequently, that U.S. products are at a competitive disadvantage in the two markets.

For U.S. goods, these presentations usually start out with the basic U.S. f.o.b. price and calculate the "cost of entry" to the European market by adding transportation costs to Europe, the European tariff, and the full European border tax adjustment. This amount is then compared with the "cost of entry" of the same European goods into the U.S. market, calculated in a similar manner. 1/ The comparison is made principally to show the degree to which trade barriers of the two countries are reciprocally imposed when they ship similar products to each other. In this respect, it is analagous to comparing tariff rates in the two countries to identify rate disparities.

By far the more important question, however, is the effect of border taxes upon competition, and this can only be examined meaningfully

1/ Although it was unclear, it appeared that most of the "cost of entry" calculations for European products shipped to the United States erroneously subtracted the amount of the border tax adjustment from an f.o.b. price, which already would have excluded the internal tax, thus resulting in the European "cost of entry" to the U.S. market being understated by the amount of the border tax export rebates to the European producer. Using such calculations, it is no wonder that the U.S. producer finds extreme "discrimination" in the border tax adjustment mechanism.

by looking at its effect on the price of the foreign and domestic products in the same market, not in separate markets. In examining this question, it must be kept in mind that both the domestic and imported products are subject to the same consumption tax, and consequently so far as this part of the cost of entering the market is concerned, they are on an equal basis unless the rate of taxation differs. <sup>1/</sup> Thus, in such a comparison, border tax adjustments have significance only to the extent they exceed (or are less than) the internal taxes with which they are associated.

Border tax adjustments in the context  
of general equilibrium theory

A truly meaningful economic analysis of border tax adjustments can only be made in the context of all relevant factors which are constantly exerting their force toward a general equilibrium in the economic world. An individual producer faced with a tax increase will examine the market for his product and the markets in which he buys his labor and material to see how much of the tax he may succeed in passing on to the consumer in terms of a price increase. His conclusion with respect to his immediate individual situation can (and likely will) differ markedly from a more general analysis of the overall effects of the tax increase on the domestic economy and trade as a whole. Moreover, the situation which may permit an individual producer to shift his tax may disappear over the long run as more general

---

<sup>1/</sup> As explained elsewhere in this discussion, even though the rates nominally are the same, such differences effectively can result, for example, from incomplete forward shifting of the consumption tax in the domestic product.

counterbalancing economic forces come into operation to restore equilibrium.

To gain a possible price advantage for the trade balance through border tax adjustments which nominally match the rate of the internal indirect tax, other important economic forces may have to come into operation. For example, government monetary and fiscal policy measures may be needed to prevent or slow down domestic price increases that might accompany an increase in the rate of indirect taxation. Such a policy might be designed to dampen wage increases. The success or failure of such an attempt would depend on general employment conditions in the economy, the amount of unused production capacity available, the domestic political situation of those elements in the economy that might object to a deflationary policy, and other factors affecting the economic situation.

Such a situation, where many aspects of the economy impinge on the final results of an indirect tax increase, is the context in which most economists see border tax adjustments and their possible effect on the trade balance. <sup>1/</sup> Several general points should be made in this regard, to be kept in mind when judging evidence and arguments about the trade effect of border tax adjustments.

First, the border tax adjustment mechanism can serve as a tool which allows (but does not alone cause) an extra improvement to be made

---

<sup>1/</sup> A model of this form is described implicitly in "Border Taxes, Border Tax Adjustments, Comparative Advantage, and the Balance of Payments", by Harry Johnson and Mel Krauss in Canadian Journal of Economics, November 1970. For an explicit description of such a model, see R. Baldwin, Nontariff Distortions of International Trade, The Brookings Institute, 1973.

in the trade balance during a period of government deflationary economic policy. A deflationary policy of slowing down inflation would normally be expected to improve the trade balance anyway. The imposition of an indirect tax increase and an associated equivalent border tax adjustment would boost the trade balance effect still more in the short run. <sup>1/</sup> On the other hand, the border tax mechanism also can be managed to produce the opposite effect. For example, in late 1968, West Germany, pending an upward revaluation of the deutsch mark, purposely "undercompensated" at the border for its value-added tax on domestic consumption, and therefore, in effect, subsidized imports and taxed exports.

The second point to be borne in mind is that in the situation where the competitive position of domestic firms is improved through the border tax adjustment mechanism, the deflationary policies which enable this can have some strong adverse effects as well. The gains that firms might make vis-a-vis the outside world could well be offset

---

<sup>1/</sup> A deflationary policy boosts trade as it slows domestic price increases relative to foreign price increases. This makes domestic goods cheaper to foreigners and domestic customers alike. Thus exports tend to increase and imports decrease. The addition of a price effect by an excess border tax adjustment makes imports even more expensive and exports less expensive, thus accentuating the effect of the deflationary policy.

See "Tax Adjustments on Internationally Traded Goods," by Paul Wonnacott in United States International Economic Policy in an Interdependent World, Washington, D.C., July 1971 (The Williams Commission Report).

by domestic employment conditions, etc., which would dampen domestic demand. 1/

The third point, and the one most strongly emphasized by many economists, is that any trade gains made in conjunction with border tax adjustments and domestic policies may last only for a short period of time. In the long run, counteracting forces in the economy will be set in motion which work to neutralize the original gains. Where the final result ends, whether the temporary trade improvement is cancelled out, depends upon several subsequent factors in the economic situation.

A deflationary policy is quite likely to improve the trade balance if indirect tax increases and border tax adjustments are instituted; but as the trade surplus builds up and foreign exchange earnings increase, the money supply will increase (if monetary authorities take no action) causing domestic economic activity and prices to increase. This would tend to neutralize the deflationary policy and its price effects. 2/ As prices rise, the export advantage and slight tariff-like protective effects of the tax and border tax policy are lost, and the extra price incentive effect on the trade balance disappears. It is even possible that such counter effects could more than neutralize the original gains, replacing them with a net loss on the trade balance

---

1/ As previously mentioned, improvement of the trade balance via an overcharge of the border tax rate puts a total tax burden on the tax payer greater than that indicated by the indirect tax rate alone (this is part of the mechanism which helps dampen domestic demand, cuts imports, and frees more goods for export). This situation would not be viewed favorably by domestic producers both from their domestic marketing viewpoints and from their viewpoints as taxpayers.

2/ See Johnson and Krauss, op. cit. The effect of increased foreign exchange earnings increasing the money supply is automatic unless monetary authorities intervene. Also, a large trade surplus might lead to exchange rate changes.

over a longer period of time. The main point in the long-run context is that the results of deliberate policies are often complex and the long-run result may be quite different from the short run. Over a longer period of time there will appear countervailing forces affecting the final result.

In conjunction with long-run considerations, it is instructive to systematically examine the possibilities concerning the application of border tax adjustments.

A general classification of taxes and principles of their application.---Numerous classifications have been devised to describe types of taxes. One widely used distinction is to broadly divide taxes into two categories: "Direct" and "indirect." The essence of the distinction between direct and indirect taxes is their point of payment in the income/expenditure cycle of the public. Direct taxes are collected as the public receives its income; indirect taxes are collected as the public spends its income. Direct taxes are levied directly on individual incomes; indirect taxes are usually levied against goods and services, and thus only indirectly on incomes. As pointed out earlier, it is popularly held that the burden of a direct tax cannot easily be shifted or passed on to some other persons by the person on whom it is levied, but the burden of an indirect (consumption) tax can be easily shifted on to someone else by the person who is required by law to pay the tax.

Income taxes on salaries of individuals and profits of companies are regarded as direct taxes. Examples of indirect taxes in the United States are federal excise taxes and the various state sales taxes. European examples of indirect taxes are the cascade tax and the value-added tax.

Arrangements are frequently made among nations to avoid double taxation of incomes in internationally traded goods. This can be done, for example, by agreeing that products be subject either to the taxes of the exporting country (the so-called country of origin principle) or to the taxes of the importing country (the country of destination principle), but not to both. The origin principle is usually applied to direct taxes, and the destination principle to indirect taxes. In other words, income taxes are generally imposed according to where income is earned (i.e., where goods are produced), while consumption taxes are imposed according to where goods are consumed. This, broadly speaking, is a longstanding international practice and is currently followed under the provisions of the General Agreement on Tariffs and Trade. 1/

The destination principle vs. the origin principle in border tax adjustments.--In the examples given earlier, border tax adjustments were applied to traded goods according to the destination principle of taxation.

---

1/ It also is administratively easy. For example, if taxes were to be rebated that had been paid on income originating from exported goods (applying the destination principle to direct taxes), companies would be obliged to keep detailed accounts of what parts of income and expenses were associated with export production.

The other extreme possibility would be to apply border tax adjustments according to the origin principle. This would mean that for indirect taxes, goods would be taxed wherever produced, whether they were for the home market or for export. Imports, since they do not originate with home producers, would not be taxed. In a trade equilibrium situation, this would mean that domestic prices of goods would have to be the same as world prices; but because the indirect tax over the long run would be fully absorbed by wages and profits, wages and capital prices would be below what they would have been if the destination principle had been applied (at the same exchange rates). Consumers' real income, however, would be the same under either the origin or destination principle provided the ratio of total taxes to GNP was the same under both tax adjustment schemes.

These two opposite extremes shed light on the taxation "incidence" problem in the general equilibrium context in the long run. If the government taxes away some of the purchasing power of the public, it does not matter to the public, as far as what their efforts will bring in real goods, whether the taxing is done by lowering their money wages to buy a lesser amount of available goods at the old pre-tax prices, or by increasing the prices of the available goods to "soak" up the pre-tax public wages.

Given two economies with equal total tax burdens, with all other conditions equal except the tax systems 1/ and with a proper constant exchange rate between them, one economy could use the origin principle of taxation while the other could use the destination principle, and neither would suffer a comparative disadvantage in world trade in the long run because of the differences in principles used. A unit of capital or labor would earn the same amount of real goods in each economy. In the destination principle economy, a citizen would receive a higher money income and pay a higher money price for both the domestic and foreign goods purchased. In the origin principle economy, a citizen would receive a lower money income but could purchase goods at the lower world price levels. Both countries' exports would enter world markets at world price levels.

The origin principle of taxation is almost by necessity applied to direct taxation, such as the income tax, because it would be extremely difficult to determine accurately the part of income and profits that comes from producing exported goods in order to use the destination principle. 2/ However, provided wages and profits have had sufficient

---

1/ Direct versus indirect tax systems may have differences in their distribution of the tax burden on the population by income levels and the economic effects ensuing therefrom. These differences have to do with tax concepts such as progressivity of taxes. However, as far as trade effects are concerned, both direct and indirect tax systems can be trade neutral under either origin or destination principles of taxation. The association of the origin principle with direct taxes and the destination principle with indirect taxes is one of tradition and administrative convenience.

2/ The U.S. DISC scheme (where a separate exporting corporation must be set up to keep account of export-related income) is good evidence of the difficulties involved in trying to associate income earned and exports.

time to adjust, a country which relies more on the origin principle of taxation than on the destination principle does not suffer a comparative disadvantage in trade. Since the origin principle is associated with direct taxation in today's world and the destination principle is used for most of the indirect taxation, it follows that a country will not be disadvantaged by relying more on direct taxes than on indirect taxes in the long run. This means that comparisons of absolute ratios of indirect taxation to direct taxation or indirect taxation as a percentage of total taxation have little meaning. <sup>1/</sup> If large differences in these ratios exist over a long period of time, other adjustments in the economies occur to neutralize any trade balance effects that the disparities once might have implied. However, economists do find some short term significance in changes in the trends in the relevant ratios.

Summary of the trade effects of internal tax changes.--In light of the origin and destination principle concepts, some generalizations can be made about the situations that might lead to trade balance changes in conjunction with certain taxation changes.

Any movement from the origin to the destination principle creates a possibility for a trade balance improvement. Whether or not one actually occurs depends on the government monetary and fiscal policies

---

<sup>1/</sup> See appendix 7-B at the end of this chapter.

at the time, as well as general economic conditions. An indirect tax increase can cause such a movement if other conditions stay the same (including the amount of direct taxes in the economy). Since direct taxes follow the origin principle and indirect taxes have border tax adjustments applied by the destination principle, an indirect tax increase would constitute a movement from the origin principle to the destination principle (relatively) for the entire tax structure. However, the short term trade effect would depend solely on the general economic situation and general government economic policies at the moment. Final trade balance improvements might not occur at all in the long run.

Conversely, any movement from the destination principle of taxation to the origin principle can create the conditions for a possible deterioration of the trade balance in the short run. But here again, the short run effects depend on the economic situation and the government policies followed. Again, the forces encouraging a deterioration in the short run may well be offset over a longer period of time when wages, profits, and prices have had a chance to adjust in the economy.

Changes in direct vs. indirect taxation in OECD countries.--In conjunction with the above arguments, it is useful to look at data for the United States and several major trading partners over a long period of time. Charts 7-A, 7-B, and 7-C show plots of a possible indicator of the movement of a country between the origin and the destination principles of taxation. These indexes were made by calculating the

Chart 7-A. -- Canada, Japan and the United States: Index of the ratio of (indirect taxes/total taxes) to a weighted average ratio of (indirect taxes to total taxes) of nine developed countries, 1951-1970. 1/

1/ 1967 GNP values were used as weights for the weighted index.

Source: Data for 1953-1969 are from National Accounts of OECD Countries, 1953-1969; data for 1970 are from National Accounts of OECD Countries, 1960-1970, OECD, Paris, 1971 and 1972, respectively.

Chart 7-B. -- France, Belgium and the Netherlands: Index of the ratio of (indirect taxes/total taxes) to a weighted average ratio of (indirect taxes to total taxes) of nine developed countries, 1951-1970. 1/

1/ 1967 GNP values were used as weights for the weighted index.

Chart 7-C.-- Italy, United Kingdom and Germany: Index of the ratio of (indirect taxes/total taxes) to a weighted average ratio of (indirect taxes to total taxes) of nine developed countries, 1951-1970. <sup>1/</sup>

<sup>1/</sup> 1967 GNP values were used as weights for the weighted index.

Source: Data for 1953-1969 are from National Accounts of OECD Countries, 1953-1969; data for 1970 are from National Accounts of OECD Countries, 1960-1970, OECD, Paris, 1971 and 1972, respectively.

ratio of (indirect taxes/total taxes) to the weighted average ratio over a period of years. Country GNP's in 1967 were used as weights in the average ratio. Consequently, the weighted means reflect the relative sizes of the economies used, and the U.S. weight accounted for almost half of the weights. It could be argued that the ratio of business taxes to indirect taxes might be a more important aspect of the origin-destination principle argument and should be used instead of the measure shown. However, the ratio used does reflect the entire movement from the origin to the destination principle, considering the overwhelmingly prevailing practice of using the origin principle for direct taxes and the destination principle for indirect taxes.

A decline in the index number on the charts means that taxation in the country has moved towards more direct taxes (and thus the origin principle of taxation) relative to all other countries. A rise in the index indicates that the country has increased direct taxes relative to indirect and has moved towards the destination principle of taxation. All of the indexes, being calculated with the moving weighted mean as a base, indicate the relative movement of a country's tax system compared to the weighted average movement for the nine major OECD countries used.

It is clear from the similar movements of large trading partners, that the chosen index reflects the business cycle to some extent. The United States and Canada move together quite closely, as do all of the European countries.

The index also does reflect known large changes in the indirect tax structure. For example, the removal of many indirect excise taxes in the United States in 1965 and 1966 is represented by a dip in the U.S. index at that time. An increase in the Italian indirect tax at the end of 1964 is consistent with the rise in the Italian index at that period on chart 7-C.

The most interesting fact observed in these charts is that the U.S. index moved in a way relative to the other countries that allowed for a potential improvement in the U.S. trade balance over the period 1951-1964. From 1964 to 1969 there was a slight decline, or at least a leveling off of the U.S. movement, in the U.S., relatively toward the destination principle of taxation. This implies that the relative movement in the U.S. tax system over the two decades shown has not been in the direction which would have allowed adverse trade effects. If anything, it has been generally in the other direction.

On the other hand, most of the European countries have moved relatively toward the origin principle of taxation over the two decades. From 1965 onward there has been a slight increase toward the destination principle again, especially in the case of the United Kingdom. Canada and the United States have followed each other closely over the entire period. Japan had a dramatic relative shift from the destination to the origin principle from 1959 to 1965. The Common Market countries, with the exception of the Netherlands, seem to be moving during the period toward a common ratio, the probable result of tax harmonization policies.

All countries have fluctuations in their indexes, but generally those countries against which U.S. producers have complained the most about the border-tax issue (the European Common Market countries) have moved relatively from the destination principle to the origin principle over the last two decades. This is the general direction that would allow a deterioration, not an improvement, in their respective trade balances. Furthermore, the major absolute differences between the U.S. ratio and many of the other ratios have remained relatively the same over most of the period. Any coming together has generally been in the direction that would allow an improvement of the U.S. trade balance and a deterioration of the foreign balance. In light of the general economic arguments and the data in the charts, it would appear that arguments that the United States has been disadvantaged by a greater absolute reliance on direct taxes and the border tax adjustment rules of GATT do not have much merit. <sup>1/</sup> In fact, the general movements have been in the opposite direction.

It is true, however, that since 1964 and 1965 the long term trends have slowed down or even slightly reversed for many countries, and it

---

<sup>1/</sup> Since the United States has relied less (absolutely) on indirect taxes over a long period, and since its trade balance was positive over much of that period, one must conclude that the United States suffered no disadvantage over this period due to its more direct tax structure. Its deteriorating trade performance in the latter sixties occurred when its tax mix, relative to other countries, was about the same in absolute terms as it was since the early fifties, and the deterioration, therefore, was due to other economic problems. (Similar conclusions are suggested by a simple econometric model in the appendix to this chapter.)

is also after this period that the United States began to complain about the border tax adjustment problem. The charts would indicate that after 1965, Japan, Italy, the United Kingdom, West Germany, and to a lesser extent Belgium, may have slightly increased their relative potential for using border tax adjustments as an accompanying policy tool for the temporary improvement in their trade balances.

In summary, the data show that absolute differences in indirect tax shares can and do persist between countries over periods in which trade balances have oscillated from surplus to deficit. The data also show that from the early 1950's to the middle of the 1960's, if any trade effects resulted from changes in indirect taxes, they have probably been either neutral or a positive factor for the U.S. trade balance in the long run. From the latter half of the 1960's, some European countries have started to reverse the long-term trend and have created a potential for slight temporary improvements in their own trade balance via domestic policies plus the border tax adjustment trade effects.

Short-run trade effects.--The only part of the border tax problem left for examination is the possibility of short-run trade effects occurring in conjunction with indirect tax changes. Such effects would be expected to be similar to exchange rate changes but perhaps not as strong as an exchange rate change for many reasons. The trade effects of border tax adjustments may have come about inadvertently, or because

of internal policy changes, with only secondary consideration being given to any trade balance effect. An exchange rate change, on the other hand, comes about with the trade balance expressly in mind and with other monetary and fiscal policies being coordinated to insure the success of the exchange rate change. Furthermore, it must be strongly emphasized that movements between the origin and destination principle of taxation only create the potential for improvements in the trade balance; they do not assure that the improvement will occur.

It would be extremely difficult to ascribe any trade balance effect to the potential boost related to border tax adjustments without having a very complete econometric model of the economy to work with. Tax, monetary, and other variables would have to be linked through price indicators to see what the effects of an indirect tax share change might be on the economy and the trade balance. It would then be necessary to sort out what part of that trade effect occurred because of the extra possibility for trade improvement due to the use of the border tax adjustment in conjunction with the change in the indirect tax share or rate in the economy. It is normally difficult to link aggregate relative price changes to import and export changes. <sup>1/</sup> To try to determine and measure the link between one of the factors potentially contributing to the price change and the trade effect would somewhat resemble trying to find a mouse in a herd of stampeding horses.

---

<sup>1/</sup> See: H. Houthakker and S. Magee, "Income and Price Elasticities in World Trade," The Review of Economics and Statistics, Vol. 60, No. 2, May 1969.

Comparative tax burdens and tax systems

Bearing in mind the points stressed in the preceding pages, it will be useful to summarize some of the general data on taxation in the major trading nations and on tax systems in general, which are either used in, or relevant to, complaints made against border tax adjustments.

Total tax burdens.--The importance of taxes in an economy can be summarized in the concept of total tax burden. One commonly used measure of total tax burden is the relationship, or ratio, of total taxes collected to the Gross National Product (GNP). This measure is given for selected developed countries in table 7-F, where it is seen that taxes have grown relative to GNP for most of the countries over the decades of the 1950's to 1960's. For the entire group, this is evidenced in the growth of the simple arithmetic mean ratio from 26.3 percent of GNP in 1953 to 34.1 percent of GNP in 1970.

To facilitate relative comparisons of individual country data with the group data over time, table 7-F also shows indexes of the country tax burden ratios calculated relative to the mean tax burden ratio for all countries in the table. Reading down the columns, the relative size of the various country tax burdens can be compared to the average burden of all the countries for that year. Reading across a row gives an indication (for a particular country) of the change in the country's tax burden with respect to the average burden over time.

Table 7-F shows that in the decade of the 1960's, the tax burden for most countries was quite similar, with the exception of Japan on

Table 7-F.--Total taxes collected as a percentage of Gross National Product, and index of the ratio of (total taxes collected/GNP) to the mean ratio for selected countries in specified years, 1953-1970

Country	1953	1957	1961	1967	1968	1969	1970

1/ Not available

2/ Previous years values are used in the means where the 1969 and 1970 data are not available.

Source: Data for 1953-1969 are from National Accounts of OECD countries, 1953-1969; data for 1970 are from National Accounts of OECD countries, 1960-1970, OECD, Paris, 1971 and 1972, respectively.

the low end and Sweden on the higher end. Furthermore, the U.S. tax burden was slightly below the average.

It has been argued that a lighter relative tax burden spurs a country's competitiveness in world markets and creates incentives for production to locate within the country rather than outside. <sup>1/</sup> If this were true, the United States would be at a disadvantage only to Japan and, to a lesser extent, Switzerland. The United States does not seem to be at a tax burden disadvantage compared to the Common Market countries, the European Free Trade Area countries, or Canada.

Tax burdens excluding social security taxes.--Table 7-G gives the tax burden measures excluding social security taxes. The measures run 5-6 percentage points lower, on an average, than the total burden including social security, but the relative tax burden positions remain roughly the same. Here the mean has risen only about 3 percentage points between 1953 and 1970, indicating that half of the rise in tax burden in table 7-G was due to increases in social security taxes. When social security taxes are excluded, the U.S. tax burden, though slightly below the average, is often slightly above that of the major Common Market countries.

---

<sup>1/</sup> Tax differences among trading countries which affected production location decisions could be expected to affect trade flows. A company has the choice of servicing the national market by locating there or locating outside and exporting to that national market. Tariffs, taxes, wages, resources, etc. all enter into the location decision.

It must also be kept in mind that even if two countries have equal tax burdens, the government which spends the most revenue in a manner which stimulates production would be giving the largest boost to the international competitiveness of its industries.

Table 7-G.--Taxes collected (excluding social security taxes) as a percentage of Gross National Product, and the index of the ratio of (taxes collected/GNP) to the mean ratio for selected countries in specified years, 1953-1970

1/ Not available.

2/ Previous years values are used in the means where the 1969 and 1970 data are not available.

Source: Data for 1953-1969 are from National Accounts of OECD countries, 1953-1969; data for 1970 are from National Accounts of OECD countries, 1960-1970, OECD, Paris, 1971 and 1972, respectively.

Corporate tax burdens.--A second feature of the tax system that is thought to be important for international competitiveness (and corporate decisions stemming from the competitive situation) is the corporate tax burden. The international competitiveness effect 1/ of the corporate tax burden depends upon whether or not corporate taxes are passed on in price increases. Assuming many other economic factors affecting competitors to be constant, if higher corporate taxes result in higher prices, the high tax countries will be at a disadvantage in world markets. However, the major econometric studies on the shifting of corporate taxes into price increases have given contradictory results. One study found that corporate taxes in the United States were completely passed along in price increases; a later study found fault with the methodology of the first and reached a directly opposite conclusion, i.e., that corporate tax increases are completely absorbed by profits. 2/ Table 7-H gives the direct corporate tax burden as a percentage of GNP for selected developed countries. This measure of the corporate tax burden has several recognized shortcomings, but it is almost the only measure readily available. The table also gives the index number form of the measurement.

---

1/ Competitiveness from a multinational corporate viewpoint really means serving a foreign market by exporting to it from the home country, locating production within the foreign borders, or exporting to it from a third country. Then if a multinational corporation unit imports in a foreign market, it has other options besides exporting to that market.

2/ Krzyzaniak and Musgrave, in The Shifting of the Corporation Income Tax, Baltimore, Johns Hopkins Press, 1963, found that U.S. corporate taxes are completely shifted forward, i.e., that they were passed on in price increases. Cragg, Harberger, and Mieszkowski in a later study ("Empirical Evidence of the Incidence of the Corporation Income Tax," Journal of Political Economy, Vol. 75, No. 6, December 1967) found fault with the Krzyzaniak and Musgrave study. Furthermore, they found completely opposite results with their own method, i.e., that corporate income tax increases were completely absorbed by the owners of capital.

1/ Not available.

2/ Due to a change in statistical reporting for 1970, separate data for direct corporate taxes were not shown in the 1972 OECD statistics for Canada, the United States, West Germany, Sweden, and the United Kingdom. Estimates of direct corporate taxes for these countries in 1970, have been based principally upon the rates of such taxes to total direct taxes in 1969 (or 1968 in the case of Canada and Sweden).

3/ Previous years values are used in the means where the 1969 and 1970 data are not available.

Source: Data for 1953-1969 are from National Accounts of OECD countries, 1953-1969; data for 1970 are from National Accounts of OECD countries, 1960-1970, OECD, Paris, 1971 and 1972, respectively.

The measures in tables 7-H indicate that the U.S. corporate tax burden is relatively high compared to most of the other countries (with the exception of Japan). They further indicate that the U.S. burden has increased slightly faster than the average corporate tax burden over the two decades cited. However, the above conclusions are changed dramatically if employers' contributions to social security are included in the corporate tax burden. If corporate direct taxes affect prices, then the same argument may well hold for corporate social security costs.

Table 7-I, which gives the corporate tax burden picture inclusive of the contributions to social security, indicates that the corporate tax burden in the United States is about average, is below that of the Common Market countries, and has been roughly the same, relative to the mean, over the time period covered. Therefore, even if total corporate tax burdens can make a difference in national competitiveness in international trade, the United States is not disadvantaged relative to most of Europe by the corporate tax burden. It is also apparent from table 7-I that relative changes in the U.S. corporate tax burden over time have been small.

Economists generally acknowledge arguments about possible trade effects stemming from absolute differences in tax burdens, but also hold that other factors must be taken into account to link tax burdens to trade. However, even if absolute differences in tax burdens (total or total corporate) do affect international competitiveness, there is clearly not too much difference in these burdens among the major trading nations. The U.S. burdens are not above those of the other major OECD

Table 7-I.--Direct corporate taxes plus employers contributions to social security as a percentage of Gross National Product, and the index of the ratio of (direct corporate taxes plus employers contributions to social security/GNP) to the mean ratio for selected countries in specified years, 1953-1970

1/ Not available.

2/ Due to a change in statistical reporting for 1970, separate data for direct corporate taxes were not shown in the 1972 OECD statistics for Canada, the United States, West Germany, Sweden, and the United Kingdom. Estimates of direct corporate taxes for these countries in 1970 have been made based principally upon the ratio of such taxes to total direct taxes in 1969 (or 1968 in the case of Canada and Sweden).

3/ Previous years values are used in the means when the 1969 and 1970 data are not available.

Source: Data for 1953-1969 are from National Accounts of OECD countries, 1953-1969; data for 1970 are from National Accounts of OECD countries, 1960-1970, OECD, Paris, 1971 and 1972, respectively.

countries (with the exception of Japan for the total tax burden and Japan and Canada for the total corporate tax burden).

Direct and indirect taxes in the major tax systems.--1/The main area of tax systems remaining for examination is that of the relative mix between direct and indirect taxes in the tax system. It is primarily in this area where industry complaints lie. As pointed out earlier, under the long standing practice which was incorporated into the General Agreement on Tariffs and Trade, border tax adjustments are allowed, generally speaking, with indirect taxes but not with direct taxes. Tables 7-J and 7-K give the ratios of indirect taxes to total tax collections for the major OECD countries, with and without social security taxes. The ratios for the United States have been roughly 20 to 30 percent below the average over the past two decades. The ratios have declined in the United States as well as other countries, but the U.S. position has remained roughly constant relative to the average. 2/ Direct taxes do, therefore, play a somewhat stronger role in the tax structure of the United States than in the other major OECD countries.

Figures citing the comparatively higher direct corporate tax collections relative to indirect tax collections are given in tables 7-L and 7-M. Even when corporate social security payments are included,

---

1/ In an earlier section, changes in the direct/indirect tax mix over time and their implication in terms of movements from the origin to destination principle of taxation were examined. Here examples are given of the actual data used in percentage and index number form.

2/ The ratio of indirect taxes to total taxes may change because of a) indirect tax rate changes, b) direct tax rate changes, c) changes in the relative amount collected over the business cycle, and d) the inflationary growth of income tax collections under progressive tax rates. (This last cause, especially, may explain some of the decline in the ratio for many countries).

2/ Due to a change in statistical reporting for 1970, separate data for direct corporate taxes were not shown in the 1972 OECD statistics for Canada, the United States, West Germany, Sweden and the United Kingdom. Estimates of direct corporate taxes for these countries in 1970 have been made based principally upon the ratio of such taxes to total direct taxes in 1969 (or 1968 in the case of Canada and Sweden).

3/ Previous years values are used in the means where the 1969 and 1970 data are not available.

Source: Data for 1953-1969 are from National Accounts of OECD countries, 1953-1969; data for 1970 are from National Accounts of OECD countries, 1960-1970, OECD, Paris, 1971 and 1972, respectively.

the U.S. ratio is almost 30 to 40 percent higher than the mean in the 1960's.

Whether or not social security payments are included, the ratios of direct corporate taxes to indirect taxes have remained fairly constant or have even declined slightly over the period covered in the tables. Therefore, whether one looks at indirect taxes as part of the whole tax system for the United States or compares business taxes with indirect taxes, the United States has not changed its mix of indirect taxes relative to the average of all countries very much over the last twenty years.

Thus it is seen that even when social security payments of businesses are included, the United States does rely as much as 35 to 40 percent more on direct business taxes compared to indirect taxes than the average OECD country does. Industry spokesmen tend to cite such absolute differences in claims that the United States is greatly disadvantaged by the GATT rules which do not allow border tax adjustments for direct taxes such as those on corporations. <sup>1/</sup> As pointed out earlier, however, economists do not generally consider these absolute differences to be of much significance, and assign even less importance to them when some general long term economic considerations are taken into account.

---

<sup>1/</sup> While the U.S. figures are above the average, their relation to other country's figures varies considerably. For example, table 7-M shows that until 1970 the ratios of corporate to indirect taxes are relatively similar for France, the United States, and Japan, and are generally lower for the other European countries (with the notable exception of the Netherlands).

The principal border tax adjustments in selected  
major countries

The principal internal taxes in Canada, the European Community (including the United Kingdom), Japan, and the United States during the past few years for which compensatory tax adjustments are made on traded goods are briefly described in the paragraphs below. As pointed out at the beginning of this section, border tax adjustments are encountered in virtually every country. Many of the rates listed below cannot be considered as insubstantial, but significantly higher rates are frequently found in other countries, especially developing nations, and particularly on certain products, such as automobiles, which may be considered a luxury or a drain on scarce foreign exchange reserves.

Canada.--The principal indirect taxes in Canada are a manufacturers sales tax, federal selective excise taxes and duties, and provincial sales and excise taxes.

The manufacturers sales tax of 12 percent applies to most goods and is levied on sales by manufacturers or producers in Canada (and on imports, using the value for customs duty purposes as the base for calculating the tax).

Federal excise taxes apply to a narrow range of goods which include cigarettes, cigars, jewelry, radios, phonographs, and toilet articles. Some of the rates are specific, others are ad valorem. In 1970, the ad valorem rates were 10 and 15 percent. The excise taxes apply to both domestic and imported products, except in the case of wines, where the excise tax applies only to the domestic products (but a corresponding duty is levied on imports).

Federal excise duties differ from excise taxes in that the excise duties are restricted to domestic production. The customs tariff, however, places a corresponding levy on imported products. Excise duties apply to alcoholic beverages (other than wines) and tobacco products. The rates are all specific. In 1970, the excise duty on distilled spirits was \$14.25 (Canadian dollars) per proof gallon; the tax on beer was 42 cents per gallon.

Provincial excise taxes are levied in eight of the ten provinces on gasoline, diesel fuel, and cigarettes. The motor fuel taxes in 1970 ranged from 13 cents to 25 cents per gallon.

Provincial sales taxes at the retail stage exist in nine of the ten provinces at rates ranging from about 5 percent to 8 percent. They are levied on most retail sales to consumers.

The European Community (including the United Kingdom).--The European Community is using the value-added tax as a means of economic integration. Each of the members of the Community, including the new members, now uses the value-added tax, and directives by the EC Commission seek to make the systems harmonious. At the present time, two members apply a single VAT rate; three have two rates; two have three rates; and two have four rates. When more than one rate is used, the "standard" rate applies to most products, and other rates apply to specified categories. Eventually the VAT rates are to be harmonized for similar goods. A standard rate between 12 and 18 percent and a lower rate between 5.5 and 7.5 percent have been proposed.

The tabulation below shows current VAT rates for the members of the Community:

<u>Country</u>	<u>Standard rate</u> (Percent)	<u>Reduced rate</u> (Percent)	<u>Intermediate rate</u> (Percent)	<u>Luxury rate</u> (Percent)
Belgium	18	6	14	25
Denmark	15	-	-	-
France	23	7.5	17.6	33.33
Germany	11	5.5	-	-
Luxembourg	10	5	-	-
Netherlands	14	4	-	-
Britain	10	-	-	-
Ireland	19.5	6.75	-	36.75
Italy	12	6	-	18

The United Kingdom and Italy have only recently adopted the value-added tax. Prior to April 1, 1973, the United Kingdom had a single stage purchase tax normally levied at the wholesale level on a wide variety of specified goods of a kind used for domestic or personal consumption. The rates were 12.5, 20, 33 1/3, and 50 percent. Until January 1, 1973, Italy applied a cascade tax system to virtually all products. Rates ranged from 0.8 to 14.4 percent with a normal rate of 4 percent. For some products, a single stage tax was applicable, ranging from 1 to 36 percent.

In addition to the value-added tax, all members of the Community apply excise taxes on selected products. The most important usually are taxes on alcoholic beverages, hydrocarbon oils, and tobacco products.

The list of specific products subject to excise taxes varies from country to country. The following products are subject to an excise tax in one or more of the member states:

alcoholic beverages	gas	salt
acetic acid	hydrocarbon oils	soft drinks
cocoa	matches	sugar
coffee	meat	table waters
electrical energy	mechanical lighters	tea
ethyl alcohol	playing cards	tobacco and tobacco
explosives	saccharin	products

Japan.--Japan's principal consumption tax is a single-stage "commodity tax" which is levied usually at the manufacture stage on a fairly extensive list of consumer goods other than foods, medicines and some other essentials. Rates range generally from 5 to 40 percent. For example, small passenger cars, small refrigerators, and small television sets pay a tax of 15 percent; large refrigerators and television sets and ordinary passenger cars pay 20 percent; and watches with precious metal and large motor boats pay 40 percent.

Special excise taxes are levied on alcoholic beverages, sugar, and hydrocarbon oils.

United States.--Federal excise taxes apply to trucks, buses, and trailers (10 percent of manufacturer's price); tires (5 cents or 10 cents per pound); gasoline, diesel and special fuels, and lubricating oil (4 cents or 6 cents per gallon); certain firearms; fishing equipment; sugar; alcoholic beverages (various rates ranging up to \$10.50 per proof or wine gallon); and tobacco products (e.g., 8 cents per pack for cigarettes).

Most states levy excise taxes on a fairly restricted list of products. The most common products are motor fuels, alcoholic beverages,

tobacco products, and motor vehicles. Some local jurisdictions also impose taxes on these products.

Retail sales taxes are levied by state and local governments. Local sales taxes rarely exceed 1 or 2 percent. Retail taxes are levied in 44 states and the District of Columbia, and generally apply to all retail sales. In some cases, food, clothing, goods subject to state excise taxes, services or capital goods are exempt. The tax rate varied from 2 percent to 6 percent in 1970, with the most common rate at 3 percent.

U.S. excise tax on distilled spirits: The wine-gallon/proof-gallon issue.--A special situation in the application of border taxes which has had much attention for many years is found in the manner in which the U.S. excise tax on distilled spirits is assessed.

The United States levies on domestic and imported distilled beverages an internal revenue tax of \$10.50 on each proof gallon (or wine gallon, when the beverage is below proof). <sup>1/</sup> In other words, if the beverage tests 100 proof at the time the tax is assessed, it is taxed \$10.50 per gallon; if it is more than 100 proof, it is taxed a proportionate additional amount of the base tax; but if it is below proof, it nevertheless pays the full \$10.50 per gallon base rate. In sum, the beverage which is assessed when it is below proof actually bears a higher tax per unit of proof.

---

<sup>1/</sup> The term "proof" refers to the ethyl alcohol content of a liquid at 60 degrees Fahrenheit stated as twice the percent of ethyl alcohol by volume, e.g., a gallon of pure ethyl alcohol is 200 proof and is equivalent to 2 proof gallons. A "proof gallon" is the equivalent of a U.S. gallon containing 50 percent of ethyl alcohol by volume, i.e., 100 proof. A "wine gallon" is a standard U.S. gallon of liquid measure equivalent to a volume of 231 cubic inches.

For domestically produced distilled spirits, the tax is assessed at a point in the production process when the product is at or above 100 proof, and before it has been "cut" (diluted with water) to the lower proof at which it is normally bottled (usually 80-86 proof for whiskey). Foreign producers who wish to ship their product to the United States may also have the tax levied at this "low-tax-rate point" in the production process if they ship their product in bulk to the United States and have it bottled after entering the country. However, if it is shipped already bottled, it normally has been cut to 84-86 proof (in the case of whiskey, more for some other beverages), and therefore must pay approximately 14-16 percent more tax than the competing bottle of domestic distilled spirits (or foreign spirits imported in bulk). The domestic producer of an 86 proof whiskey, for example, pays a tax of \$9.03 per bottled gallon on his product, while the foreign shipper of bottled whiskey to the United States pays a tax of \$10.50 on his product.

The U.S. import duty on distilled spirits is assessed in the same manner as the excise tax, thereby adding an additional discrimination against bottled imports in comparison with bulk imports.

This dual wine-gallon/proof-gallon basis of taxation and duty assessment has long been a subject of complaint by foreign distillers and U.S. importers of bottled spirits, and it has been given wide publicity as one of the more notable nontariff trade barriers maintained by the United States. Critics of the system suggest that the tax (and customs) treatment of imported and domestic distilled spirits

should be equalized by providing that the tax and import duty be assessed on a proof-gallon basis in all cases.

The wine-gallon/proof-gallon assessment method illustrates a situation where, in the strict legal sense, no discrimination can be found in the law, but when viewed in the context of the customary conduct of a particular trade, a significant discriminatory result is found in the law's operation. Bottled spirit importers and their foreign suppliers point out that their product must pay a higher tax than domestically produced spirits on equal measures of the product as delivered to the consumer.

Widely divergent views on the consequence of the removal of the wine-gallon/proof-gallon system have been put forth by spokesmen for U.S. distilled spirit producers and by importers. At one extreme, it is contended that the difference in tax and duty collections would be simply transferred from receipts of the U.S. Treasury to receipts of the importers and foreign producers without change in existing trade practices or patterns. On the other extreme, it is suggested that the amount of the overpayment would be largely passed on to consumers in the form of reduced prices for imported distilled spirits (with a concomitant increase in competition for domestic spirits and possibly complete elimination of the practice of importing bulk spirits for bottling in the United States). Along this line, one prominent importer of bottled distilled spirits reported to the Tariff Commission that replacement of the wine-gallon/proof-gallon assessment method by simple proof-gallon assessment would enable him to increase his U.S. sales of imported Scotch whiskey and cordials by 10 percent, brandy by 5 percent, and rum by 33 1/3 percent.

### Other Charges

Besides variable levies and the easily recognizable forms of border tax adjustments, other nontariff charges assessed on imports are numerous and go by a variety of names. The better known are consular fees, stamp taxes, statistical taxes, port charges and import surcharges.

In responses to the Tariff Commission's survey of trade barriers, there was described an almost endless variety of fees, taxes, and charges levied on imports by various countries--a bridge tax, examination tax, university tax, stadium tax, luxury tax, monopoly tax, phytosanitary tax, development tax, maintenance tax, sanitary tax, lighthouse tax, etc. Many of these, in last analysis, are actually border tax adjustments for internal taxes also assessed on domestic products. Some, such as port fees or import surcharges, are levied solely on imports. Others apply only to imports, in effect, because there is no domestic production.

In complaints to the Tariff Commission, three products especially were stressed as being subjected to unusually heavy or discriminatory taxes or charges: Automobiles, motion picture films, and alcoholic beverages. Nontariff charges on these are described below, as well as the other principal types of charges which were the subject of complaint.

#### Automobile taxes and fees

Motor vehicles, and especially passenger cars, are a prominent object of taxation and other types of charges in almost all countries

of the world. In the Commission's survey of trade barriers, the U.S. automobile industry presented a 66 page tabular "digest" of the almost endless variety of taxes levied on automobiles. The taxes are particularly numerous, and usually higher, in the developing nations.

In principle, the taxes would appear to be nondiscriminatory in the sense that the same rate applies to domestically produced and imported automobiles of the same class or category. Also, in countries where there is no domestic automobile industry (the great majority of nations), the same rate applies to imports without regard to their origin. In practice, however, the schedule of tax rates for a country is frequently steeply progressive, depending upon such factors as horsepower, cylinder capacity, weight, value, and wheelbase measurements. Consequently the taxes impinge far more heavily upon the type of automobiles which make up the bulk of U.S. production than on the automobile products of other countries. In some cases, the taxes are openly discriminatory (e.g., a lower rate is assessed if the vehicle is shipped completely knocked down for local assembly or if locally produced components are used). Many of the taxes which U.S. automobile producers reported encountering abroad are also assessed on other products, but the rate applicable to automobiles frequently is substantially higher.

Listed below are the various taxes reported on passenger cars for 13 countries (in alphabetical order). Some of the charges are actually types discussed in other parts of this chapter (border tax adjustments, statistical taxes, etc.). Nevertheless, they are reported here to give a complete picture of the impact of the numerous charges encountered by

U.S. automotive product exports. The countries have been selected for illustrative purposes only; almost any other group of countries could have been chosen to display more or less the same situation. The taxes are collected in addition to import duties, which are also given in the list in order to show the cumulative effect of the charges. It will be noted that although many of the taxes are not exclusively applied to automobiles and are not discriminatory, per se, they substantially increase the cost of the vehicle to the ultimate consumer, and consequently are regarded by U.S. producers as a limitation upon their potential sales abroad.

Argentina:

Customs duty: 140 percent ad val. c.i.f.  
 Statistical tax: 1.5 percent of c.i.f.  
 Tax on ocean freight: 4 percent.  
 Steel Fund tax: 20 pesos per kg.  
 (A prior import deposit of 40 percent of the c.i.f. value for 180 days is also required.)

Australia:

Customs duty: 45 percent ad val. based on domestic value in country of origin, or sales value, whichever is higher.  
 Sales tax: 27.5 percent calculated on duty-paid-value increased by 20 percent.

Brazil:

Customs duty: 70 percent, 85 percent, or 105 percent ad val. c.i.f., depending upon weight and value.  
 Industrial products tax: 24 percent, 28 percent or 30 percent.  
 Port assessment: 2 percent of c.i.f. value.  
 Marine assessment tax: 20 percent of net ocean freight.  
 Merchandise circulation tax: 15-17 percent of duty-paid value.

France:

Customs duty: 11 percent ad val. c.i.f.  
 Value added tax: 33 1/3 percent of duty-paid value.  
 Customs stamp tax: 2 percent of import duty.  
 Annual tax: Range up to 1,000 francs (\$230), based on fiscal horsepower and/or age.

## Greece:

Customs duty: 19.64 percent ad val. c.i.f.  
 Turnover tax: 8.75 percent of the duty-and-tax-paid value.  
 Luxury tax: 25 percent ad val. c.i.f. on cars valued over \$1,800.  
 Special import tax: 5 percent of c.i.f. value.  
 Export promotion tax: 0.15 percent of c.i.f. value.  
 Stamp tax: 4 percent of duty-and-tax-paid value.  
 Initial registration fee: 19,500-100,000 drachmas (\$721 to \$3,700).  
 Annual license (circulation) fee: 280-840 drachmas (\$10 to \$31).

## Indonesia:

Customs duty:  
 Assembled vehicles: 200 or 300 percent ad val. c.i.f., depending on value.  
 Completely knocked down: 50 percent ad val. c.i.f.  
 Sales tax: 50 percent of duty-paid value.  
 Retribution tax: 1 percent of the value of the import.

## Japan:

Customs duty: 6.4 percent ad val. c.i.f.  
 Automotive tax: 4,500-90,000 yen (\$16.07-\$321.43) 1/ annually depending on cylinder capacity and wheelbase measurements (rates are less for business use).  
 Commodity tax: 15 percent or 20 percent, depending on wheelbase measurements and engine capacity.  
 Purchase tax: 3 percent of actual purchase price.  
 Road tax: Annual assessment of the rate of 2,500 yen (\$8.93) 1/ per 0.5 ton of curb weight.  
 Supplemental road tax: Annual assessment ranging from \$30 for very small cars to \$140 for large cars.

## Jordan:

Customs duty:  
 Gasoline fuel cars: 450-600 fils (\$1.40-\$1.87) per kilo.  
 Non-gasoline fuel cars: 1200-2000 fils (\$3.73-\$6.22) per kilo.  
 Additional tax: 1 percent ad val. c.i.f.  
 Examination tax: 2 percent ad val. c.i.f.  
 Social welfare tax: 0.5 percent ad val. c.i.f.  
 King Hussein stadium tax: 0.5 percent ad val. c.i.f.  
 Jordan University tax: 1 percent ad val. c.i.f.  
 Aviation tax: 2 percent ad val. c.i.f.  
 Portage fee: \$0.06 per 100 kg.  
 Import license fee: 4 percent ad val. c.i.f.

---

1/ Yen converted to dollars at the rate of \$1 = 280 yen.

## Norway:

Customs duty: 8 percent ad val. c.i.f.  
 Excise tax: 67 percent of first 5,000 crowns (\$897) of duty-paid value; 100 percent on the remainder.  
 Turnover tax: approximately 20 percent of duty-paid value.  
 Traffic tax: up to 0.02 percent ad val.

## South Africa:

## Customs duty:

Assembled: 45 percent plus 2 percent ad val. f.o.b. for each 100 rand (\$149.50) plus 1 percent ad val. for every 100 pounds over 2,500 pounds.

Completely knocked down: 20 percent ad val. f.o.b.

Excise tax on cars manufactured or assembled in South Africa: 15 cents or 17 cents or more per pound, depending on weight, with a maximum tax of 3,500 Rand (\$5,232). Tax can be reduced by 15 to 75 percent by use of South African products in assembly.

Sales tax: 5-20 percent of the duty (not applicable to locally produced vehicles).

Wharfage fee: 1.35 percent.

## Spain:

Customs duty: 68 percent ad val. c.i.f.  
 Internal compensating tax: 13 percent of the duty-paid value.  
 Luxury tax: 20 percent of the duty-paid value.

## Turkey:

Customs duty: 75 percent ad val. c.i.f.  
 Stamp tax: 10 percent ad val. c.i.f.  
 Customs surtax: 15 percent of customs duty.  
 Customs clearing charges: variable.  
 Port tax: 5 percent c.i.f. value plus customs duty, customs surtax and customs clearing charge.  
 Production tax: 25 percent of c.i.f. value plus customs duty, customs surtax, customs clearing charge and port tax.

## United Kingdom:

Customs duty: 11-22 percent ad val. c.i.f., depending on engine displacement.  
 Purchase tax: 36 2/3 percent of the wholesale value in the United Kingdom.

Film taxes

Motion picture films are subject to several types of taxes in many countries. The taxes are usually imposed by the national government,

frequently as a theater admission tax. Several countries either impose higher taxes on imported films than on films domestically produced, or impose internal taxes on imported films but not on the like domestic products, or remit taxes on domestic films exhibited in the national market but not on imported films. Some countries also discriminate among foreign countries in the application of internal taxes. In several countries, proceeds of the taxes are used to aid domestic motion picture production.

In Argentina, Belgium, Denmark, Finland, Italy, Taiwan, and Turkey, a higher admissions tax is collected on the exhibition of foreign films than for domestically produced motion pictures. In addition to the higher tax on foreign films, Italy partially rebates taxes on films originating in the European Community. (Proceeds of the Italian tax are used to subsidize Italian film producers.) France taxes films in a nondiscriminatory manner, in principal, but the French Government has granted certain exceptions which, in effect, result in discrimination against foreign films. In Chile, distributors and exhibitors are assessed a 17 percent turnover tax on imported films.

Spain charges a dubbing tax on imported films which varies according to origin. Some U.S. films are charged from 250 to 400 percent more than films from other sources. For example, U.S. cinemascope films are assessed \$15,000 while similar European films are charged \$4,000. There are a few exceptions to the fee, such as festival films and children's films. Revenue derived from the dubbing fee is used to subsidize production of films in Spain.

In addition to the dubbing fee, Spain imposes a licensing fee and an income tax. The licensing fee is charged on subtitled films (20 percent of the dubbing fee) and on foreign language films (5 percent of the dubbing fee). The income tax is charged on rentals of all films and amounts to 10 percent of gross on Spanish films and 25 percent on foreign films.

The Arab Republic of Egypt applies a release tax on imported films based on the length of the film. The revenue obtained from taxing imported films which are more than 30 minutes in length is used for the development of the domestic film industry and to promote the production of social, educational, and scientific films. The tax is not assessed on domestic films.

In Algeria, Argentina, Brazil, Chile, Colombia, India, Pakistan, the Philippines, Taiwan, and Thailand, discriminatory income taxes or other restrictions are assessed on income from the exhibition of foreign films when removed from the country.

#### Alcoholic beverage taxes

A variety of excise, consumption or special taxes or fees are levied by many countries on alcoholic beverages. Most of these are internal taxes levied equally upon imported and domestic products, and consequently are actually within the definition of border tax adjustments. Many appear as "stamp" taxes. Alcoholic beverage exporters and producers also complained of prior import deposit costs, port fees, and consular fees.

Respondents in the Commission's survey complained of the severity of the taxes and charges on alcoholic beverages in nine Western European countries, South Africa, Australia, New Zealand, Canada, Japan, the United States, and eighteen developing nations.

A few complaints were received concerning discriminatory tax treatment. U.S. whiskey producers have repeatedly objected to the French imposition of higher excise taxes on grain spirits (produced only in limited quantities in France) than are imposed upon brandies and other spirits produced from fruit. In several countries (principally LDC's) the tax appears as a surcharge levied only on imports. The U.S. method of assessing excise taxes (and import duties) on distilled spirits is considered by foreign suppliers to discriminate against imports of bottled goods (see discussion of the U.S. wine gallon/proof gallon method of assessment in the earlier part of this chapter dealing with border tax adjustments).

#### Port charges and maritime taxes

All ports, including those in the United States, levy fees, taxes or other charges upon vessels using the port and/or upon cargo shipped through the port. Usually the charges are to cover the cost of operating the port and to provide a return upon the capital invested in the port facilities. Occasionally, fees are levied to provide revenue for other purposes. For example, several countries assess fees specifically to aid the national maritime industry. It is customary that several different fees are charged, depending upon the kinds of services used or the cargo shipped. Charges upon the cargo frequently are based upon

its weight, but in many countries the charges are an ad valorem assessment upon the c.i.f. value of the shipment. In some countries, certain charges are calculated as a percentage of the duty collected on the shipment; in others, as a percentage of the freight cost. In some ports, particularly in developing countries, the total charges may run as high as 12 or 15 percent of the c.i.f. value of the shipment.

Some respondents in the Commission's survey complained of the amount of port charges encountered in shipping to Uruguay, Guinea, Libya, West Germany, Syria, Arab Republic of Egypt, Turkey, Iran, South Africa, Switzerland, Sudan, Somali Republic, Mexico, Taiwan and Japan.

#### Statistical and administrative taxes and fees

Complaints were registered against statistical taxes in Argentina, Austria, Burundi, the Congo, Dahomey, France, Guinea, Italy, Ivory Coast, Mauritania, Niger, Peru, Rwanda, Senegal, Somali Republic, Surinam, Switzerland, Togo, Arab Republic of Egypt, and Upper Volta. The fees range between 0.1 percent in Rwanda to 4 percent in Senegal. The taxes are defended by these countries as necessary to maintain adequate trade statistics. It is often argued that the fee is not discriminatory since, in at least several of the countries, it applies to both exports and imports. However, in some countries a higher fee is levied on duty-free imports than is levied on dutiable products, and the Italian tax is not assessed upon imports into Italy from other EC member states.

So-called "administrative" fees levied on shipments to Afghanistan, Bermuda, Brazil, Chile, Dominican Republic, Malaysia, Mexico, Tunisia, and Yugoslavia were also the subject of complaints.

Prior import deposits

Since World War II import deposit systems have been increasingly used by countries experiencing balance of payments difficulties as a means of retarding the flow of their imports. Under such systems, the importer is required to deposit with the government, usually in a non-interest bearing account and for a fixed term, a percentage of the value of the import. Import deposit systems have sometimes also been used for other purposes of control or surveillance by countries not suffering a balance of payments deficit.

In either case, the commitment of capital to this purpose, whether or not in a noninterest bearing account, increases the cost of imports by an amount equal to the rate of return that could be obtained from alternative uses of the money. This imposes a serious limitation on imports, depending on the level and duration of the required deposits. 1/

The amount and duration of the deposit range widely. The import deposit which was in effect in Japan until May of 1970 required a deposit of only 1 percent of the value of the import for a period running from the date an import license was issued until the time the goods were actually imported. No interest was paid unless the deposit was made in cash. Japan claimed that the deposit was necessary to insure the smooth operation of the import licensing system. (U.S. exporters, however, felt it was simply a method for closer surveillance and control of imports.)

---

1/ The Tariff Commission's survey revealed that U.S. exporters often provide foreign importers with the funds necessary for prior deposits.

On the other hand, when the United Kingdom found itself in a balance of payments crisis in late 1968, an import deposit of 50 percent of the value of the merchandise was required. (The United Kingdom system was eventually terminated in 1970.) In developing countries, where import deposit systems are most prevalent, the rate of deposits has been known to run as high as 10,000 percent, and it is not uncommon that they are well above 100 percent.

Import deposit systems exist in a significant number of countries--some 20 to 25--and the impact is severe enough to have elicited a large number of complaints from U.S. firms during the course of the Commission's study.

Almost half of the complaints received by the Commission were directed towards Central and South American countries. Firms and associations specifically mentioned prior deposits imposed on imports into Argentina, the Dominican Republic, Uruguay, Colombia, Mexico, Brazil, Peru, Ecuador, and Paraguay as impediments to their sales. One chemical firm, for example, reported that "several countries of South America require from importers inordinately high deposits for imported products... Although the deposit is returned within 6 months, it usually means an unproductive tie-up of significant sums of working capital." If a firm has a large and continuing volume of sales to another country, an established sum is often left with the account of the Central Bank (after each liquidation of a covered shipment) in order to cover future deposits. A large tobacco exporter states that this is a necessary procedure, but

"needlessly ties up the importer's capital and is subject to devaluation risk." Another chemical company reported that if Colombia would remove prior deposit requirements along with various other types of red tape, sales of chemicals, laboratory and bulk medicinal materials could increase by \$50,000 and radiopharmaceuticals by \$10,000 in the first year. A tool manufacturer reported that if import deposit requirements and import licensing practices were removed in South America, the firm's sales could increase by \$1 million per year. Another tool company stated that advance deposits along with import licensing formalities in Latin America, Africa, and the Far East "create long delays and unnecessary expense." If these were removed, according to the firm, its sales would be expected to increase by \$2 million. A photographic supply manufacturer stated that if prior deposit requirements were removed by Colombia, Chile, and Argentina, the firm's sales might increase by \$500,000 annually. The Scientific Apparatus Makers Association objected to prior deposit requirements stating that "since instrument systems are built to particular specifications, such deposits may be held as long as 6 to 8 months. The added cost such a requirement imposes on imported items is apparent."

Besides the prior deposit requirements existing in many of the countries of Central and South America, the device also is, or has been, used in Greece, Iceland, Indonesia, Japan, Korea, Turkey, Yugoslavia, the Philippines, Finland, the United Kingdom, Tunisia, Iran, Israel, and Ethiopia. The rates charged usually have varied within each country (depending upon the product imported) and have ranged from one to several

hundred percent of the c.i.f. value of the product. The funds have been usually retained for several months without benefit of interest. 1/

It was reported that at least one country--Indonesia--retains the deposit as payment for services rendered. The principal declared purpose of the deposit in some of these countries is to ensure that import business is conducted by financially sound companies and individuals. At least one country insists that the fee is necessary to ensure that imports actually take place and discourage indiscreet applications for licenses. Several of the developing nations indicated that the measure is needed to restrain imports of nonessential goods and to regulate the domestic money supply.

The degree of trade restriction imposed by prior import deposit requirements depends principally upon: (1) the amount of deposit required, (2) the cost of financing, (3) the length of time which deposits are held, and (4) the products and countries to which applied. The GATT contracting parties have allowed the use of prior deposits only in cases of balance of payments difficulties, and have suggested guidelines in administering prior deposit systems with a view toward limiting their duration and confining their restrictive effect to the level justifiable by the country's balance of payments situation.

#### Consular fees

Exports to many nations, principally developing countries, entail the payment of consular fees or charges by the exporter. The fees

---

1/ Japan is the only country which is reported to have ever paid interest on prior deposits--2.555 percent.

usually are associated with issuance of a consular invoice or other required documentation for imports entering the particular country.

In some cases the fees are a fixed charge; in others they are dependent upon the value of the shipment. Countries collecting such fees justify them as necessary to cover the cost of operating the consulate or for collection of general revenue for the government.

Complaints to the Tariff Commission concerning consular fees named the following countries: Afghanistan, Angola, Argentina, Arab Republic of Egypt, Brazil, Chile, Colombia, Dominican Republic, Goa, Haiti, Honduras, India, Mexico, Nicaragua, Panama, Paraguay, Peru, Philippine Republic, Portugal, South Africa, Turkey, Uruguay, and Venezuela.

Charges running as high as 7 percent of the c.i.f. value of the shipment were reported. Some of the complaints indicated that although the fee itself is nominal, the administrative expense of complying with the documentation or other requirements for which the fee is charged raised the total cost to a significant level.

#### Stamp taxes

"Stamp tax" is the descriptive term frequently applied to taxes which are paid through the purchase of revenue stamps issued by the taxing authorities, who require that the stamps be affixed to articles or documents before they may be lawfully sold, purchased or used. The procedure is a common method for collecting excise taxes on certain consumer products, such as tobacco or alcoholic beverages, or assessing taxes on the transfer of documents.

In the Commission's survey of trade barriers, 47 complaints against "stamp taxes" were received. The complainants generally did not specify the exact nature of the tax, the amount of the tax, or whether it was actually discriminatory against imported goods. Countries named in the complaints were: Argentina, Bermuda, Colombia, Costa Rica, France, Greece, Guinea, Haiti, Iraq, Israel, Italy, Madagascar, Mexico, Morocco, Peru, Portugal, South Africa, South West Africa, Taiwan, Togo, Turkey, Upper Volta, Venezuela, and the West African Customs Union.

### Surcharges

The term "surcharge," when used with reference to imports, usually designates a tax or levy applied in the same manner as a customs tariff, but in addition to the normal import duty. Sometimes the additional tax is calculated as a percentage of the duty already collected. When the amount of the surcharge is nominal, it usually has been levied for purposes already discussed above (i.e., a port fee, statistical tax, administrative tax, etc.). In other cases, however, it is likely to have been levied for the specific purpose of stemming the flow of imports to correct balance of payments deficits, and the amount is substantial. In some situations, however, the "surcharge" is actually the counterpart of an internal tax equally applied on like domestic products.

Among developed countries, Denmark, the United Kingdom and the United States have resorted to the temporary use of import surcharges for balance of payments reasons in recent years. Other countries where complaints in the Tariff Commission's survey of trade barriers reported encountering surcharges were the following: Angola, Argentina, Bahamas,

Barbados, Bermuda, Bolivia, Brazil, Burundi, Colombia, Dominican Republic, Ecuador, El Salvador, France, West Germany, Greece, Guatemala, Honduras, Indonesia, Italy, Jamaica, Japan, South Korea, Libya, Malawi, Mexico, Mozambique, Nepal, Nicaragua, Nigeria, Pakistan, Paraguay, Peru, Saudi Arabia, Switzerland, Sudan, Taiwan, Turkey, and Uruguay. Many of the reported surcharges were nominal (2 or 3 percent of the customs duty); others ranged as high as 30 or 32 percent of the c.i.f. value of the shipment.

#### Other "special" taxes

In addition to the categories of taxes discussed above, respondents in the Commission's survey of trade barriers objected to a large variety of other taxes or fees which they encountered in trading in over fifty nations. Seven developed countries and 43 developing nations were specifically named in the complaints.

Most of the complaints gave only the local name for the tax, without specifying its amount or whether it was actually discriminatory in its application to imported products. From the incomplete data which were supplied, many of the charges appear to be border tax adjustments for equivalent internal taxes on domestic products. Some, such as Argentina's steel fund tax and forestry products tax, are levied exclusively on imports, and the receipts are frequently used to aid the national industries. It is not uncommon to be assessed several different taxes simultaneously. One U.S. exporter, for example, reported paying (on a shipment of merchandise to an African country) a fiscal tax, a contractual tax, a temporary maintenance tax, a standard tax, a temporary

development tax, and a compensatory tax. Many of the reported taxes are assessed at relatively nominal rates, but a large number are substantial, and some range up to 50 percent of the c.i.f. value of the shipment. The names given to the principal taxes reported are listed below, in alphabetical order:

bridge tax	maintenance tax
cement tax	municipal tax
communal tax	national red cross tax
compensatory tax	package tax
contractual tax	phytosanitary tax
defense tax	production tax
development tax	sanitary tax
fiscal tax	standard tax
foreign exchange tax	steel fund tax
forestry products tax	warehouse tax
harbor construction tax	
luxury tax	
monopoly equalization tax	

## Chapter VII

## APPENDIX

## Appendix 7-A

Products subject to variable levies under the European Community's  
Common Agricultural Policy

<u>Tariff Number</u>	<u>Commodity Description</u>	<u>Type of Restriction</u> 1/	<u>Remarks</u>
01.02 AII	Live animals of the bovine species, domestic, except breeding stock	(1)	
01.03 AII	Live animals of the porcine species, except breeding stock	(3)	
01.05	Live poultry	(3)	
02.01 AII	Bovine meat, fresh, chilled, frozen (beef and veal)	(1)	
02.01 AIIa	Meat of domestic swine, fresh, chilled, or frozen	(3)	
02.01 BIIc	Pork offal, fresh, chilled, or frozen	(3)	Levy must not exceed GATT binding of 12% ad valorem (liver, 14% ad valorem).
02.02	Poultry meat and edible offal (except liver), fresh, chilled, or frozen	(3)	
02.03	Poultry liver, fresh, chilled, frozen, or in brine	(3)	Levy must not exceed GATT binding of 5% ad valorem on fatted goose or duck liver and 14% on other poultry liver.
02.05	Unrendered pig or poultry fat, free of lean meat, fresh, chilled, frozen, salted or in brine, dried or smoked	(3)	

1/ Restrictions are coded as follows:

- |  |  |
|--|--|
| (1) Duty with additional levy <u>sometimes</u> assessed.   | (5) Duty plus additional duty on sugar (ads).  |
| (2) Duty with additional levy <u>always</u> assessed.  | (6) Duty plus additional duty on flour (adf).  |
| (3) Levy only (replaces the duty).   | (7) Miscellaneous compensatory tax assessed in certain conditions in addition to the duty. |
| (4) Duty plus the variable component (VC) for raw agricultural commodity(ies) contained therein. |  |

<u>Tariff Number</u>	<u>Commodity Description</u>	<u>Type of Restriction 1/</u>	<u>Remarks</u>
02.06 B	Meat and edible offal of pork, salted or in brine, dried or smoked	(3)	
02.06 CI a	Beef and veal, salted, brined, dried or smoked	(1)	
03.01 BI(a)2	Herring, fresh or frozen, imported from June 16 to February 14.	(7)	
03.01 BI(c)	Tuna, fresh or frozen	(7)	
04.01 B	Milk and cream, fresh, not concentrated or sweetened of a fat content exceeding 6% by weight	(3)	
04.02	Milk and cream, preserved, concentrated, or sweetened	(3)	
04.03	Butter	(3)	
04.04	Cheese and curd	(3)	
04.05 AI	Poultry eggs, in shell, fresh or preserved	(3)	
04.05 BI	Poultry eggs not in shell and egg yolks, for human consumption	(3)	
07.01 M	Tomatoes, fresh	(7)	
07.01 NII	Olives, fresh or chilled, intended for the production of oil	(2)	
07.03 AII	Olives, preserved in brine or other solutions, intended for the production of oil	(2)	
07.06 B	Roots of manioc, arrowroot, salep, and other similar roots and tubers with high starch content except sweet potatoes	(3)	Levy must not exceed 6% ad valorem

1/ Restrictions are coded as follows:

- |  |  |
|--|--|
| (1) Duty with additional levy <u>sometimes</u> assessed.   | (5) Duty plus additional duty on sugar (ads).  |
| (2) Duty with additional levy <u>always</u> assessed.  | (6) Duty plus additional duty on flour (adf).  |
| (3) Levy only (replaces the duty).   | (7) Miscellaneous compensatory tax assessed in certain conditions in addition to the duty. |
| (4) Duty plus the variable component (VC) for raw agricultural commodity(ies) contained therein. |  |

<u>Tariff Number</u>	<u>Commodity Description</u>	<u>Type of Restriction 1/</u>	<u>Remarks</u>
08.02 AI	Sweet oranges, fresh	(7)	U.S. prices have always been above the reference price.
08.02 B	Mandarins, clementines, tangerines, other similar citrus hybrids	(7)	U.S. prices have always been above the reference price.
08.02 C	Lemons	(7)	To date prices of all imports have always been above the reference price. Thus the compensatory tax has never been invoked.
08.04 AI	Table grapes	(7)	
08.04 AII	Fresh grapes other than table grapes	(7)	May be subject to a derived compensatory tax, if such a tax is imposed on wine imported below the reference price.
08.06 AII	Apples, not for cider	(7)	To date, prices of all imports have always been above the reference price. Thus, the compensatory tax has never been invoked. However, imports were made subject to emergency licensing in 1970 due to low domestic prices.

---

1/ Restrictions are coded as follows:

- |  |  |
|--|--|
| (1) Duty with additional levy <u>sometimes</u> assessed.   | (5) Duty plus additional duty on sugar (ads).  |
| (2) Duty with additional levy <u>always</u> assessed.  | (6) Duty plus additional duty on flour (adf).  |
| (3) Levy only (replaces the duty).   | (7) Miscellaneous compensatory tax assessed in certain conditions in addition to the duty. |
| (4) Duty plus the variable component (VC) for raw agricultural commodity(ies) contained therein. |  |

<u>Tariff Number</u>	<u>Commodity Description</u>	<u>Type of Restriction 1/</u>	<u>Remarks</u>
08.06 BII	Pears, not for perry	(7)	To date, prices of all imports have always been above the reference price. Thus, the compensatory tax has never been invoked.
08.07 B	Peaches, fresh	(7)	U.S. prices have always been above the reference price.
08.07 C	Cherries, fresh	(7)	To date, prices of all imports have always been above the reference price. Thus, the compensatory tax has never been invoked.
08.07 D	Plums, fresh	(7)	U.S. prices have always been above the reference price.
10.01	Wheat and meslin	(3)	
10.02	Rye	(3)	
10.03	Barley	(3)	
10.04	Oats	(3)	

---

1/ Restrictions are coded as follows:

- |  |  |
|--|--|
| (1) Duty with additional levy <u>sometimes</u> assessed.   | (5) Duty plus additional duty on sugar (ads).  |
| (2) Duty with additional levy <u>always</u> assessed.  | (6) Duty plus additional duty on flour (adf).  |
| (3) Levy only (replaces the duty).   | (7) Miscellaneous compensatory tax assessed in certain conditions in addition to the duty. |
| (4) Duty plus the variable component (VC) for raw agricultural commodity(ies) contained therein. |  |

<u>Tariff Number</u>	<u>Commodity Description</u>	<u>Type of Restriction</u> 1/	<u>Remarks</u>
10.05 A	Hybrid seed corn	(3)	Levy on hybrid seed corn must not exceed 4% ad valorem bound in GATT. Imports from non-GATT countries must meet a reference price.
10.05 B	Other corn	(3)	
10.06	Rice	(3)	
10.07	Buckwheat, millet, canary seed, grain sorghum, other cereals	(3)	
11.01	Cereal flours	(3)	
11.02	Cereal groats and meal, other worked cereal grains except husked, glazed, polished or broken rice; germs of cereals including flours thereof	(3)	
11.06	Flour and meal of sago and manioc, arrowroot, salep, and other roots and tubers falling within heading No. 07.06	(3)	
11.07	Malt, roasted or not	(3)	
11.08 A	Starches	(3)	
11.09	Gluten and gluten flour, roasted or not	(3)	
12.04	Sugar beet, whole or sliced, fresh, dried, or powdered; sugar cane	(3)	

---

1/ Restrictions are coded as follows:

- |  |  |
|--|--|
| (1) Duty with additional levy <u>sometimes</u> assessed.   | (5) Duty plus additional duty on sugar (ads).  |
| (2) Duty with additional levy <u>always</u> assessed.  | (6) Duty plus additional duty on flour (adf).  |
| (3) Levy only (replaces the duty).   | (7) Miscellaneous compensatory tax assessed in certain conditions in addition to the duty. |
| (4) Duty plus the variable component (VC) for raw agricultural commodity(ies) contained therein. |  |

<u>Tariff Number</u>	<u>Commodity Description</u>	<u>Type of Restriction</u> <sup>1/</sup>	<u>Remarks</u>
15.01	Lard and other rendered pig fat; rendered poultry fat	(3)	
15.04	Fats and oils of fish and marine mammals, whether or not refined	(7)	
15.07 A	Olive oil, crude, refined or purified	(3)	In 1971 olive oil was given compensatory protection in addition to variable levies. Compensatory taxes have not yet been imposed on olive oil however.
15.07 B,C,D	Other vegetable oils, crude, refined or purified	(7)	Compensatory tax has been applied to imports of rapeseed oil and castor oil deemed to have been subsidized by the exporting country. License required for imports of vegetable oils into Italy because of extra crushing subsidy paid there.
15.12	Animal or vegetable oils and fats, hydrogenated or otherwise solidified, but not further prepared.	(7)	Compensatory tax not yet implemented.
15.13	Margarine and other prepared food fats	(7)	Compensatory tax not yet implemented.

<sup>1/</sup> Restrictions are coded as follows:

- |   |  |
|---|--|
| (1) Duty with additional levy <u>sometimes</u> assessed.  | (5) Duty plus additional duty on sugar (ads).  |
| (2) Duty with additional levy <u>always</u> assessed.   | (6) Duty plus additional duty on flour (adf).  |
| (3) Levy only (replaces the duty).  | (7) Miscellaneous compensatory tax assessed in certain conditions in addition to the duty. |
| (4) Duty plus the variable component (VC) for raw agricultural commodity(ies) contained therein |  |

<u>Tariff Number</u>	<u>Commodity Description</u>	<u>Type of Restriction 1/</u>	<u>Remarks</u>
15.17 A	Residues containing oil having the characteristics of olive oil	(3)	
15.17 B	Other residues from the treatment of animal or vegetable fats or waxes	(7)	Compensatory tax not yet implemented.
16.01 A	Sausages and similar products of liver	(3)	Levy must not exceed 24% ad valorem bound in GATT.
16.01 B	Other sausage	(3)	
16.02 AII	Prepared or preserved liver, other than goose or duck liver	(3)	Levy must not exceed 25% ad valorem bound in GATT.
16.02 BI	Prepared or preserved meat or offal of poultry, other than liver	(3)	Levy must not exceed 17 % ad valorem bound in GATT.
16.02 BIIIa	Prepared or preserved pork meat or offal, other than liver	(3)	
17.01	Beet and cane sugar, solid	(3)	
17.02 A,B,D, E,F	Other sugars, syrups, etc., except maple sugar and syrup	(3)	
17.02 C	Maple sugar and syrup	(3)	Levy must not exceed 20% ad valorem bound in GATT.
17.03	Molasses	(3)	

1/ Restrictions are coded as follows:

- |  |  |
|--|--|
| (1) Duty with additional levy <u>sometimes</u> assessed.   | (5) Duty plus additional duty on sugar (ads).  |
| (2) Duty with additional levy <u>always</u> assessed.  | (6) Duty plus additional duty on flour (adf).  |
| (3) Levy only (replaces the duty).   | (7) Miscellaneous compensatory tax assessed in certain conditions in addition to the duty. |
| (4) Duty plus the variable component (VC) for raw agricultural commodity(ies) contained therein. |  |

<u>Tariff Number</u>	<u>Commodity Description</u>	<u>Type of Restriction 1/</u>	<u>Remarks</u>
17.04 B	Chewing gum	(4)	Levy must not exceed 23% ad valorem (including a fixed charge of 8% plus a variable charge related to the sugar content) bound in GATT.
17.04 C,D	Sugar confectionery not containing cocoa	(4) (5)	
17.05	Flavored or colored sugars, syrups, and molasses	(3)	
18.06 A	Cocoa powder	(4)	
18.06 B	Chocolate ice cream	(4) (5)	
18.06 C	Chocolate and chocolate goods including chocolate coated products; sugar confectionery and substitutes thereof made from sugar substitution products, containing cocoa	(4) (5)	
18.06 DI(a)	Other chocolate goods containing no fats derived from milk or containing less than 1.5% by weight of such fats in packages of 500 grams or less (net)	(4) (5)	
18.06 DI (b)	In packages of more than 500 grams (net)	(4)	
18.06 DII(a)1	Other chocolate goods containing 1.5% or more by weight but less than 6.5% of fats derived from milk, in packages of 500 grams or less (net)	(4) (5)	
18.06 DII(a)2	In packages of more than 500 grams net	(4)	

1/ Restrictions are coded as follows:

- |  |  |
|--|--|
| (1) Duty with additional levy <u>sometimes</u> assessed.   | (5) Duty plus additional duty on sugar (ads).  |
| (2) Duty with additional levy <u>always</u> assessed.  | (6) Duty plus additional duty on flour (adf).  |
| (3) Levy only (replaces the duty).   | (7) Miscellaneous compensatory tax assessed in certain conditions in addition to the duty. |
| (4) Duty plus the variable component (VC) for raw agricultural commodity(ies) contained therein. |  |

<u>Tariff Number</u>	<u>Commodity Description</u>	<u>Type of Restriction 1/</u>	<u>Remarks</u>
18.06 DII(b)1	Other chocolate goods containing 6.5% or more but less than 26% by weight of fats derived from milk, in packages of 500 grams or less (net).	(4)	
18.06 DII(b)2			
(aa)	Certain specified types of milk crumb	(4) (5)	
18.06 DII(b)2			
(bb)	Unspecified items containing 6.5% or more but less than 26% by weight of fats derived from milk	(4)	
18.06 DII(c)	Other chocolate goods containing 26% or more by weight of fats derived from milk	(4)	
19.01	Malt extract	(4)	
19.02	Preparations of flour, starch or malt extract of a kind used as infant food or for dietetic or culinary purposes, containing less than 50% by weight of cocoa	(4)	
19.03	Macaroni, spaghetti, and similar products	(4)	
19.04	Tapioca and sago; tapioca and sago substitutes obtained from potato or other starches	(4)	
19.05	Prepared foods obtained by the swelling or roasting of cereal and cereal products	(4)	
19.06	Communion wafers, empty cachets of a kind suitable for pharmaceutical use, sealing wafers, rice paper and similar products	(4)	

1/ Restrictions are coded below:

- |  |  |
|--|--|
| (1) Duty with additional levy <u>sometimes</u> assessed.   | (5) Duty plus additional duty on sugar (ads).  |
| (2) Duty with additional levy <u>always</u> assessed.  | (6) Duty plus additional duty on flour (adf).  |
| (3) Levy only (replaces the duty).   | (7) Miscellaneous compensatory tax assessed in certain conditions in addition to the duty. |
| (4) Duty plus the variable component (VC) for raw agricultural commodity(ies) contained therein. |  |

<u>Tariff Number</u>	<u>Commodity Description</u>	<u>Type of Restriction 1/</u>	<u>Remarks</u>
19.07	Bread, ships' biscuits and other bakers' wares not containing sugar, honey, eggs, fats, cheese or fruit:		
19.07 A	Knackerbrot	(4) (6)	
19.07 B	Mazoth	(4) (6)	
19.07 C	Gluten bread for diabetics	(4)	
19.07 D	Other	(4)	
19.08	Pastry, biscuits, cakes and other fine bakers' wares, whether or not containing cocoa in any proportion:		
19.08A	Gingerbread and the like containing by weight of saccharose (including invert sugar expressed as saccharose):		
19.08 AI	Less than 30%	(4)	
19.08 AII	30% or more but less than 50%	(4)	
19.08 AIII	50% or more	(4)	
19.08 B	Other:		
19.08 BI	Containing no starch or less than 5% by weight of starch, and containing by weight of saccharose (including invert sugar expressed as saccharose):		
	(a) Less than 70%	(4) (5)	
	(b) 70% or more	(4) (5)	

1/ Restrictions are coded as follows:

- |  |  |
|--|--|
| (1) Duty with additional levy <u>sometimes</u> assessed.   | (5) Duty plus additional duty on sugar (ads).  |
| (2) Duty with additional levy <u>always</u> assessed.  | (6) Duty plus additional duty on flour (adf).  |
| (3) Levy only (replaces the duty).   | (7) Miscellaneous compensatory tax assessed in certain conditions in addition to the duty. |
| (4) Duty plus the variable component (VC) for raw agricultural commodity(ies) contained therein. |  |

<u>Tariff Number</u>	<u>Commodity Description</u>	<u>Type of Restriction 1/</u>	<u>Remarks</u>
19.08 BII	Containing 5% or more but less than 32% by weight of starch:		
	(a) Containing no saccharose or less than 5% by weight of saccharose, etc.	(4) (6)	
	(b), (c), (d) Containing 5% or more of saccharose, etc.	(4) (5)	
19.08 BIII	Containing 32% or more but less than 50% by weight of starch:		
	(a) Containing no saccharose or containing less than 5% by weight of saccharose, etc.	(4) (6)	
	(b), (c) Containing 5% or more but less than 20% by weight of saccharose, etc.	(4) (5)	
19.08 BIV	Containing 50% or more but less than 65% by weight of starch:		
	(a) Containing no saccharose or containing less than 5% by weight of saccharose, etc.	(4) (6)	
	(b) Containing 5% or more by weight of saccharose, etc.	(4) (5)	
19.08 BV	Containing 65% or more of starch:		
	(a) Containing no saccharose or containing less than 5% by weight of saccharose, etc.	(4) (6)	
	(b) Other	(4) (5)	

1/ Restrictions are coded as follows:

- |  |  |

Appendix 7-B

## Technical Appendix on Border Tax Adjustments

This appendix is an exploratory attempt by staff economists at the Tariff Commission to examine possible broad relationships between tax structures and trade flows. It is a suggestion for econometric exploration of the question of whether or not permanent absolute differences in tax structures among countries do affect trade flows. The appendix does not investigate the possibility of short term trade effects that might result from changes in tax rates or structures, nor does it offer any evidence regarding possible trade distortion on a product level.

The extent of the effort which it has been possible to carry out here does not warrant nor reflect any conclusion by the Commission on the trade distortion that may arise via countries' differences in internal tax systems and accompanying border tax adjustments.

A common complaint in the border tax adjustment area is that countries which rely relatively more on indirect taxes than on direct taxes are advantaged in trade because these countries can make greater use of border tax adjustments. This complaint, stated as a formal hypothesis, might read as follows: All other things being equal, countries with relatively higher ratios of indirect to direct taxes are advantaged in trade. This statement reasonably presumes that "advantaged" in trade somehow means that total trade will be greater, or that the trade balance will improve (exports will be greater and imports less), or that trade flows will be greater from the more advantaged to the less advantaged countries. This appendix examines this formal hypothesis

in a cross-sectional regression model of trade flows between countries.<sup>1/</sup>  
 A complete description of the model follows a summary of the results.

#### Summary of the regression results

The regression analysis indicates that, holding other factors constant, countries relying relatively more on indirect taxes than direct taxes tend to import less and export less to about the same degree. Furthermore, trade flows between pairs of countries show no statistically significant relationship to the ratios of (indirect/total) taxes between the countries. Thus the aggregate data and the model do not support the suggestions that indirect taxing countries trade more or improve their overall trade balances compared to more direct taxing countries. The data also do not statistically support the suggestion that trade flows

---

<sup>1/</sup> This appendix only attempts to test versions of common complaints heard about internal taxes and border tax adjustments as they relate to trade. The appendix does not attempt to formulate and test more complex hypotheses about the relationship between taxes, tax structures, and trade. However, it is worth noting that differing taxes and tax structures, along with differing tariffs and labor costs among countries, should help determine production location decisions among countries and therefore trade flows. For example, if corporate or other direct taxes are lower in country B than in country A (all other factors being the same), companies might tend to locate more production for both countries' markets in country B. This would mean that the low tax country would show less trade on the import side and more on the export side than the high tax country. A hypothesis about taxes and trade would be more complex in such an economic context. Trade is not an end in itself, but a result of profit maximizing decisions of companies in both countries. The real world is further complicated because trade and capital accounts between countries must be roughly balanced at given exchange rates. In this simple example, country B cannot forever export to country A without importing something (either goods or capital) to allow country A to pay for its imports from country B.

will be greater from indirect tax countries to direct tax countries on a pairwise basis. 1/

#### The regression model

The model uses a set of independent variables to explain pairwise trade flows between fourteen major trading nations. 2/ The model was fitted with data for the years 1958 and 1968. 3/

---

1/ The trade advantage hypothesis consists of three specific possibilities. The first is that total trade might be increased. Thus both exports and imports might be greater. The second is that a country's trade balance might be permanently influenced, i.e., exports might be greater and imports less. The third is one of pairwise advantage, i.e., that an advantaged country would export more to a less advantaged country but might be disadvantaged in trade with an even more advantaged country. It can be argued from examining the results of the regression equations that there is not strong evidence for any of these possibilities.

2/ This type of model is discussed in: Edward E. Leamer and Robert M. Stern, Quantitative International Economics, Allyn and Bacon, Inc., Boston, 1970.

It has also been used to explain trade flows in the following sources: H. Linneman, An Econometric Study of International Trade Flows; Amsterdam: North-Holland, 1966; and K. Pulliainen, "A World Trade Study: An Econometric Model of the Pattern of the Commodity Flows in International Trade in 1947-1960," Ekonomiska Samfundets Tidskrift, No. 2, 1963, pp. 78-91.

3/ Data on trade flows between countries came from: Direction of Trade, A Supplement to the International Financial Statistics, International Monetary Fund, Washington, D.C. Data for various ratios of taxes and gross national product came from: National Accounts of OECD Countries, 1953-1969, Organization for Economic Cooperation and Development (OECD), Paris. The fourteen countries whose trade flows were used were Canada, Japan, the United States, Belgium-Luxembourg, France, Germany, Italy, the Netherlands, Austria, Denmark, Norway, Sweden, Switzerland, and the United Kingdom.

The variables used in the model are defined as follows:

E i,j	Exports from the i'th to the j'th country. This is the dependent variable that is "explained" by the model. All of the other variables following are the independent or the "explanatory" variables.
PROB i,j	The probable trade between a pair of countries assuming, given total trade of each of two countries, that each country has an equal probability of trading with each other country. $PROB_{ij} = [(Total\ exports\ of\ country\ i) \times (total\ exports\ of\ country\ j)] / Total\ exports\ of\ all\ countries\ in\ the\ sample.$
ADJ i,j	A dummy variable, $ADJ_{ij} = 1$ if two countries are adjacent to each other, $ADJ_{ij} = 0$ if they are not.
CM i,j	A dummy variable, $CM_{ij} = 1$ if two countries are members of a common market, $CM_{ij} = 0$ if they are not.
(TT/GNP) i,j	Total taxes as a percent of gross national product of the exporting (i'th) and importing (j'th) countries, respectively.
RTT i,j	Ratio of $[(TT/GNP)_i / (TT/GNP)_j]$
RID i,j	Ratio of (indirect/direct) taxes in the exporting (i'th) and importing (j'th) countries, respectively.
RAID i,j	Ratio of $[(indirect\ taxes / total\ taxes)_i / (indirect\ taxes / total\ taxes)_j]$

Other variables were tried (such as the distance between commercial centers in the trading countries) but were not used in the final results because of multicollinearity problems between these

variables and the PROB variable (which is absolutely necessary in this type of model). <sup>1/</sup>

The exponential form of the model is given in equation (1).

It was estimated in log form in a multiple regression program.

$$(1) E_{ij} = \text{constant} \times \text{PROB}_{ij}^{c_1} \times \text{ADJ}_{ij}^{c_2} \times \text{CM}_{ij}^{c_3} \times (\text{TT/GNP})_i^{c_4} \times (\text{TT/GNP})_j^{c_5} \times \text{RTT}_{ij}^{c_6} \times \text{RID}_i^{c_7} \times \text{RID}_j^{c_8} \times \text{RAID}_{ij}^{c_9}$$

Values of the log regression coefficients (the c's in equation (1)) are given for 1958 and 1968 in the following table.

Regression Coefficients of the Trade Model

Year	Coefficients (c's) $\frac{1}{}$ of the logs of --										Constant	R <sup>2</sup>
	PROB <sub>1j</sub>	ADJ <sub>1j</sub>	CM <sub>1j</sub>	(TT/GNP) <sub>1</sub>	(TT/GNP) <sub>j</sub>	RTT <sub>1j</sub>	RID <sub>1</sub>	RID <sub>j</sub>	RAID <sub>1j</sub>	Term		
1958	1.02 (15.89)	1.98 (8.27)	1.11 (1.84)*	0.47 (1.39)*	1.05 (3.24)	0.03 (0.13)*	-0.50 (-2.25)	-0.70 (-3.17)	0.35 (1.35)*	-2.30 (-0.82)*	0.71	
1968	0.91 (15.09)	2.04 (8.50)	2/ (2.30)	0.72 (2.30)	0.81 (2.69)	0.08 (0.38)*	-0.51 (-2.06)	-0.56 (-2.27)	0.53 (1.93)*	-3.76 (-1.35)*	0.68	

<sup>1/</sup> The "t" statistics for the coefficients are given in parentheses underneath the coefficients themselves.  
<sup>2/</sup> This variable was omitted for 1968 because its linear relationship with ADJ<sub>ij</sub> in 1968 created multicollinearity problems.

\* Indicates coefficients not statistically significantly different from zero at the 95 percent level.

The testing of the hypothesis as stated in the beginning paragraphs is possible because multiple regression coefficients are interpreted as effects of an independent variable on the dependent variable holding all other relevant variables constant. In this model the other relevant variables (which were statistically significant in explaining trade) were the PROB variable which indicated expected trade between two countries given no other influences, ADJ which indicated physical neighbors, and total tax burdens (TT/GNP).

<sup>1/</sup> Deleting this distance variable (or "trade resistance" variable as it is commonly called) did not lower the coefficient of determination (R<sup>2</sup>) more than 5-10 percent and did virtually eliminate the multicollinearity problem in our sample.

The (indirect/direct) tax ratios used were  $RID_i$ ,  $RID_j$ , and  $RAID_{ij}$ . Acceptance of total trade improvement would have meant positive significant coefficients for both  $RID_i$  and  $RID_j$ . Acceptance of a trade balance improvement would have meant that the difference between significant  $RID_i$  and  $RID_j$  coefficients was clearly positive. Acceptance of a pairwise trade improvement would have meant a significant positive coefficient for  $RAID_{ij}$ . <sup>1/</sup> Instead, the results were statistically significant negative signs and very similar magnitudes for  $RID_i$  and  $RID_j$  and no statistically significant values for  $RAID_{ij}$  at the 95 percent level. Thus, the proposed hypothesis was not accepted. <sup>2/</sup>

More theorizing, perhaps along the lines suggested in an earlier footnote, must be done to explain the signs and significance of the tax burden variables and the negative signs of the (indirect/direct) tax ratios. They indicate, for example, that in 1968 for a 1 percent greater tax burden, 0.72 percent more exports could be expected for the average country. For a 1 percent greater tax burden, 0.81 percent more imports could be expected for an average country. And finally, for a 1 percent greater reliance on indirect taxes, 0.51 percent and 0.56 percent less exports and imports, respectively, could be expected for an average trading country.

---

<sup>1/</sup> It was possible to include three tax structure variables separately (for the exporting and importing countries, and for the pairwise tax structures between countries) because these variables were not linearly related to each other.

<sup>2/</sup> The rejection of the significance of  $RAID_{ij}$  was very weak in 1968 compared to 1958.

## Chapter VIII

QUANTITATIVE RESTRICTIONS AND SIMILAR  
SPECIFIC LIMITATIONS ON TRADEIntroduction 1/

Quantitative import and export restrictions are the most obvious and easily identifiable of all nontariff barriers to trade. In their basic elemental forms, quantitative restrictions appear as:

- embargoes, where trade is prohibited;
- absolute quotas, where a specified maximum amount of trade is permitted in a given period; or
- a licensing system, under which administrative officials have discretionary authority to permit trade.

There are, in addition to these basic forms of quantitative restrictions, other indirect, more sophisticated and subtle arrangements which limit trade in the same manner as these three obvious quantitative restrictions. The most important are:

- exchange controls, where the kind, quantity and source of goods purchased abroad are effectively controlled by the control of foreign exchange to pay for such purchases;
- local content and mixing regulations, where consumption of specified amounts of local products are required with each unit of a foreign product consumed;
- minimum or maximum price controls, where trade is permitted only above or below stipulated prices;
- restrictive business practices, under which cartels or similar arrangements control market access; and
- discriminatory bilateral agreements, where two countries agree to purchase specified amounts of given products from each other before purchases are made from third countries.

The severity of these restrictions in application depends, of course, upon the amount of trade permitted, and consequently can range from the

1/ This chapter was completed in the summer of 1973 and therefore chiefly reflects quantitative trade restrictions being applied prior to that time. It has been possible to include some very important subsequent developments in this area only in footnote references, and there is no discussion of the restrictions on petroleum exports recently imposed by producing countries in Africa and the Middle East.

total exclusion of an embargo to a "liberal" licensing policy in which literally all applications are granted. Absolute quotas may be extremely restrictive or so large as to actually permit more trade than market conditions generate. Some absolute quotas are filled on the first day of an opening period, but also it is not uncommon for a quota to go unfilled year after year.

As is common throughout the entire panorama of nontariff barriers, a trader may encounter several of the practices described above operating together, or with other nontariff barriers discussed elsewhere in this report. Thus, an item may be subject to a quota and also to exchange controls, and quotas are frequently administered with a licensing arrangement.

Licensing arrangements, for this report, are divided into three basic types: (1) licensing used to administer announced quotas; (2) licensing used to impose discretionary controls on trade, i.e., the permitted level of trade is not publicly announced; and (3) licensing used for enforcing regulations, such as sanitary requirements not related to quantitative controls. The second type is the one given most consideration in this study. The first type is frequently considered desirable when absolute quotas are imposed in order to provide more equitable distribution of the quota among traders. The third type is more a certification of compliance with regulations or standards (discussed in Chapter X). In the following pages, references to licensing requirements can be considered as licensing used to impose discretionary controls on trade and include license systems set up to administer unannounced quotas, so-called "liberal" licensing and "automatic" licensing

systems, and those licensing systems maintained supposedly for the collection of statistics but actually for the surveillance and administrative guidance of trade. All are objectionable barriers to trade, as they create uncertainty and the possibility of delays and discrimination in the processing of applications, and unnecessary documentation costs. Even with so-called "automatic" licensing, importers are required to deal with a bureaucracy which has been found to discriminate against imports of certain commodities or from certain countries. Importers do experience unwarranted delays in obtaining licenses when the authorities are concerned about imports; and importers are reluctant to pursue this issue for fear of inviting more stringent restrictions.

The following terminology is used in describing the operation of quotas. An absolute quota is one for which the maximum amount of trade permitted is officially announced. When a product is announced to be under quantitative restriction, but the amount of trade which will be permitted is not divulged, the product is said to be under an "open-end" quota. Such a situation is very similar to the licensing arrangements under which trade is permitted at the discretion of administrative officials. In a global quota, the quota amount is specified for the world as a whole and is not allocated among supplying countries; in a bilateral quota, the amount of trade permitted from each country is specified. Dollar area quotas are global-type quotas but applicable only to countries or areas which make up the dollar currency area.

So-called tariff quotas, which are frequently included in enumerations of quantitative restrictions, are not considered as such

in this report. Under a tariff quota, an unlimited amount of imports may be entered; however, only a specified quantity is permitted to enter at a given rate of duty during a designated period, and imports in excess of the amount ("over-quota imports") are subject to a higher tariff. Tariff quotas are found in the tariff schedules of all major trading nations. A large number of such quotas (virtually all, in the case of the United States) owe their existence to trade-agreement concessions granted to improve market access for imports and encourage trade by lowering duties, albeit on a limited quantity of imports.

The administration of tariff quotas introduces some uncertainty into an import transaction in that the importer may not be able to determine which of the two rates of duty will be applicable prior to entering a shipment. For example, tariff quotas in the United States are administered on a "first come" basis. Few U.S. tariff quotas are filled immediately when a new quota period opens, and hence uncertainty as to the amount of duty occurs only later when the lower rate quota is about to be filled. However, for the U.S. tariff quota on stainless steel flatware, opening day offerings greatly exceed the within-quota amount. In this case opening day offerings are prorated among importers on a percentage basis determined by the amount that offerings exceed the within-quota quantity. In this manner, every importer is allowed the same percentage of his offers to enter at the within-quota rate; the remainder may be entered at the over-quota rate, or placed in bonded warehouse until the opening of a new period, or be re-exported. The uncertainty as to the rate and the additional administrative

procedure has been the subject of complaints that tariff quotas constitute nontariff barriers. Inasmuch as most tariff quotas have originated as trade-agreement concessions, it is difficult to justify such complaints. The trade barrier, in the case of tariff quotas, would be the tariffs themselves, not the mechanism set up to lower the tariff, and hence the cost of the import.

Quantitative limitations have generally been considered by economists as the most objectionable of all trade barriers. It has long been said that quantitative limitations, per se, are the most restrictive measures used to control trade and hence the most damaging to the principle of free choice that underlies the theory of a private enterprise economy. Other methods of limiting trade, such as tariffs, are said to be preferable to quantitative restrictions because they still leave open to consumers the possibility of choosing an imported product (admittedly at a higher cost) and to foreign producers the possibility of improving their position in the protected market by lowering their own prices. However, the distinction of being "most objectionable" should not be confined to quantitative restrictions, as numerous other devices now used are equally successful in quashing trade. The European Community's variable levy system for agricultural products, for example, effectively limits importers to supplying residual amounts such as would be permitted under a quota system, and industrial standards have been found to be drawn so as to permit use only of products from the domestic industry and exclude imports.

Throughout most of the history of the United States, quantitative import restrictions have played only a small role in U. S. trade policy. Before the 1930's, except for periods of war, import duties constituted the principal U. S. import barrier. At the 1927-28 International Conference on the Abolition of Import and Export Prohibitions and Restrictions, the United States sponsored a tightly drawn convention outlawing any form of quantitative import restrictions. The United States ratified the convention unconditionally, but it was accepted by only a few other countries. At the World Monetary and Economic Conference in London in 1933, the U. S. delegation strongly urged that embargoes, import quotas, and various other arbitrary restrictions be removed completely as quickly as possible. Later that year, at the Seventh International Conference of American States at Montevideo, a U. S. resolution, unanimously adopted by the Conference, called for the removal of quantitative restrictions through trade agreements.

The United States subsequently modified somewhat its policy on quantitative restrictions. This change reflected several factors, including the emergency conditions during the depression, the failure of the quantitative restriction prohibition convention to be widely accepted, and the increased resort to quantitative restrictions by other countries. The National Industrial Recovery Act (NIRA) of 1933 marked the initial departure from the earlier U. S. policy. Under the act, codes of fair competition were established to aid the rehabilitation of sectors of the domestic economy. Codes relating to petroleum, lumber and timber, and alcoholic beverages provided for use of import quotas; and quotas

were in fact imposed on crude oil and petroleum products, Philippine mahogany, and alcoholic beverages.

In mid-1935 basic sections of the NIRA were declared unconstitutional and the legal authority to regulate imports under the codes of fair competition ceased. In 1934, however, new authorization for quantitative restriction on imports was enacted in the Jones-Costigan Sugar Act. One year later, in 1935, authority to impose quantitative restrictions on imports was contained in section 22 of the Agricultural Adjustment Act.

During World War II, nearly all countries operated vast systems of quantitative restrictions for security and/or balance of payments reasons. At the end of the war, under the leadership of the United States, nations of the world turned to rehabilitation of the trading system and the dismantlement of these restrictions. In 1947, the framers of the General Agreement on Tariffs and Trade adopted as a fundamental principle of that Agreement the prohibition of quantitative restrictions as a means of regulating international trade, and incorporated as Article XI of the Agreement the following provision:

No prohibitions or restrictions other than duties, taxes or other charges, whether made effective through quotas, import or export licenses or other measures, shall be instituted or maintained by any contracting party on the importation of any product of the territory of any other contracting party or on the exportation or sale for export of any product destined for the territory of any other contracting party.

Exceptions were provided in Article XI to this basic rule. Restrictions were permitted (a) to prevent or relieve critical shortages of foodstuffs or other essential commodities, (b) in connection with

the enforcement of grading or marketing standards, and, (c) if they are "necessary" to enforce governmental measures dealing with any domestic agricultural or fisheries products, such as marketing or production restriction programs.

More significant exceptions to the basic rule, however, were provided in Articles XII and XVIII of the General Agreement, under which a contracting party may restrict imports to "safeguard its external financial position and its balance of payments." Articles XII and XVIII are, in substance, much the same. The former is addressed to developed countries and lays down strict limitations and criteria for the application of the import restrictions and subjects the restricting country to a yearly consultation on its balance of payments situation. Article XVIII sets up special provisions for developing countries, with somewhat less stringent limitations and criteria, and calls for a consultation every two years.

For the first decade after World War II, quantitative restrictions were widely applied by both developed and developing countries and justified on balance of payments grounds. It was not until late in 1958 that the major trading nations of Western Europe were able to reestablish external currency convertibility, and in 1960, several countries, including the United Kingdom, France, Sweden and Australia, announced they would no longer justify restrictions on balance of payments grounds. Japan continued to justify its controls on these grounds until 1963.

In 1973, GATT Article XII procedures covered restrictions applied by 3 developed countries (Finland, Iceland, and New Zealand), and Article XVIII procedures covered restrictions of 16 developing countries. 1/ Two other countries (Spain and Israel) were consulting annually or biannually under these 2 articles, but with an undefined status.

Exceptions to the prohibition against quantitative restrictions are also found in other articles of the General Agreement. The more important of these are exceptions permitted under Articles XIX, XX, XXI, and XXV. Under Article XIX (the "escape clause") emergency action can be taken against imports causing or threatening serious injury to domestic producers. Since 1948, about one-third (21) of Article XIX cases have involved imposition of quantitative restrictions.

Articles XX and XXI provide respectively for general and security exceptions to the Agreement, and thus to Article XI. Most of the general exceptions are of the kind customarily included in international agreements for many years. 2/ These Articles have been invoked only in a few cases, one case being the U.S. quotas on petroleum.

The Contracting Parties acting jointly under Article XV may waive any obligations imposed by the Agreement. Among others, waivers under Article XV have been granted from the prohibition against quantitative limitations in Article XI and obligations with respect to exchange

---

1/ Argentina, Bangladesh, Burma, Chile, Ghana, Greece, India, Indonesia, Korea, Pakistan, Peru, Turkey, Arab Republic of Egypt, Sri Lanka, Tunisia, and Yugoslavia.

2/ "...to protect public morals;...human, animal or plant life or health;...products of prison labor;" etc.

arrangements under Article XV. Under Article XXV a waiver was obtained by the United States to permit restrictions imposed by the United States under section 22 of the Agricultural Adjustment Act.

Finally, the GATT Protocol of Provisional Application specifies that these obligations of the contracting parties be applied "to the fullest extent, not inconsistent with existing legislation" [i.e., legislation existing on October 30, 1947].

Quantitative trade restrictions applied by a GATT contracting party but not absolved by one of these exemptions from the basic Article XI prohibition have come to be described as "illegal."

When drafting the Agreement, the framers of GATT undoubtedly did not consider so-called voluntary export restraints--a country's unilateral restriction of its exports to prevent "market disruption" in another country--for there is no reference to the practice throughout the Agreement. Nor have the Contracting Parties ever provided an interpretation of the status of voluntary export restraints vis-a-vis the GATT. Such limitations, nevertheless, generally are recognized as trade restrictive measures of the same character and having similar effects as any other type of quantitative restriction. Countries which find themselves compelled to apply voluntary export restraints argue that the beneficiary country is unfairly relieved of the obligations it would otherwise incur under the GATT if it applied equal restrictions on imports from the restraining country.

The GATT has provided the means for most of the achievements since World War II in removing quantitative restrictions and limiting their use. Notable progress was made, especially among developed countries,

toward elimination of restrictions originally justified on the basis of balance of payments difficulties, but certain hard-core restrictions remained in the developed countries even after the general disequilibrium in their balance of payments had disappeared. In the mid-1950's the United States led an effort to compel all countries not in balance of payments difficulties but maintaining restrictions without the cover of a justification in GATT terms to remove the restrictions or obtain an official sanction for them from the Contracting Parties by means of a special "hard-core" waiver.<sup>1/</sup> Many of the so-called illegal restrictions were associated with the inability of the major trading countries to find an acceptable way of limiting agricultural restrictions. In 1960, the best procedure that could be agreed upon as a first step to keep track of the situation was for each country to notify those of its restrictions which it considered inconsistent with provisions of the GATT (i.e., not covered by one of the several exceptions to the general Article XI prohibition against quantitative restrictions). Seventeen developed countries notified restrictions between 1960 and 1970. In 1970 a special working group on quantitative import restrictions was

---

<sup>1/</sup> The "hard-core" waiver procedure was set up under Article XXV as a temporary measure with the hope that it would in the long run provide an additional means of dealing more effectively with the problem but in the meantime maintain the integrity of the General Agreement. Under the hard-core arrangement, waivers could be granted under certain terms and conditions to individual countries by a majority of the votes cast, rather than by the usual two-thirds, to permit the continuation of import restrictions which had been imposed during balance-of-payments difficulties when the country faced problems in eliminating the restrictions. The arrangement, initially set up in 1955, was extended several times. Only Belgium resorted to its use, however, and it was allowed to lapse in 1962.

established, and a procedure has been set up for an annual inventory listing the restrictions maintained by 18 developed countries and holding consultations on their removal.

Throughout the 1960's the United States persistently sought to reduce the "hard-core" of quantitative restrictions maintained by its principal trading partners, and by the late 1960's, a relatively small list of products (mostly agricultural) remained under restrictions. Later sections of this chapter describe the restrictions remaining in individual countries and present a statistical analysis of the pattern of restrictions among countries and product sectors.

Nearly one-third of the complaints against all trade barriers collected in the Tariff Commission's present investigation dealt with quantitative restrictions and similar specific limitations on trade. A summary count of complaints in the quantitative restrictions area is given in table 8-A. The three basic elemental forms of quantitative restrictions--embargoes, quotas, and licensing requirements--drew two-thirds of the complaints in this area. The largest number (28 percent of the total) were against licensing requirements; embargoes and quotas each received about 20 percent of the total. Ten percent were against exchange and monetary controls, and the remainder were scattered among various other categories of specific limitations.

The distribution of complaints among countries is shown in table 8-B, in which all countries drawing 20 or more complaints are specifically named. Almost 60 percent of the complaints were against quantitative

restrictions in developing countries, a very few were against countries of the Eastern Trading Area, and slightly less than 40 percent against developed nations.

United States quantitative restrictions drew more complaints in the Commission's survey than those of any other single nation, but less than the total of complaints against members of the European Community or the European Free Trade Area. The complaints against developed countries followed a slightly different pattern than those against LDC's. In both cases, the three basic elemental forms of quantitative restrictions accounted for the majority of complaints, but the order of importance

differed (in developed countries: Quotas, licensing practices, embargoes; in IDC's: Licensing practices, quotas, embargoes). Exchange controls, as might be expected, were the fourth largest complaint against IDC's, but ranked lower (sixth) for the developed countries.

The next section of this chapter discusses the pattern of quantitative restrictions among selected developed countries. The very sharp contrast between the pattern of complaints submitted to the Commission and the actual pattern of restrictions among these countries provides a commentary on the difficulties of gauging the relative importance of nontariff barriers. Listed below for comparison are the number of specific limitations which were counted for selected developed countries and the number of complaints received against those countries. <sup>1/</sup>

	<u>Complaints</u>		<u>Count of specific restrictions</u>	
	<u>Number</u>	<u>Percent</u>	<u>Number</u>	<u>Percent</u>
European Free Trade Area (of eight)-----	174	29.5	1,204	34.9

United States-----	122	21.4	190	5.5
Japan-----	106	18.6	177	5.1
Canada-----	20	3.5	143	4.1
Total-----	<u>576</u>	<u>100.0</u>	<u>3,448</u>	<u>100.0</u>

---

<sup>1/</sup> The count of specific restrictions is from table 8-G in the next section of this chapter; the number of complaints from table 8-B.

Among these selected countries the European Community nations had half of the counted restrictions, but received only 27 percent of the complaints; the United States and Japan each had just above 5 percent of the restrictions, but respectively drew about 21 percent and 19 percent of the complaints.

Table 8-C shows the distribution of the complaints among product sectors, by type of restriction. It is interesting to note that the complaints are divided between industrial and agricultural products in proportions almost identical to the division of U. S. trade between these two areas (roughly 80 percent industrial, 20 percent agricultural), despite the fact that proportionally, the agricultural area is much more heavily impacted by quantitative restrictions than the industrial area.<sup>1/</sup> Within these two areas, however, the pattern of complaints does not follow trade importance, although there was a strong tendency for the sectors with large trade to draw a greater number of complaints. For example, the five largest industrial sectors, in terms of trade, drew 38.8 percent of the complaints, and the three largest agricultural sectors 10.9 percent, in each case roughly half of the complaints in each area. The variety of restrictions complained against in a product sector also tended to be less in sectors of less trade importance.

---

2/ Total counts are not the same as those in tables 8-A and 8-B because a single complaint in those tables may involve more than one product sector and not all complaints specified a product.

Source: Compiled from submissions to the Tariff Commission.

Economists and others have devised various estimates of the cost to consumers of quota restrictions on trade (including voluntary export restraints). The consumer cost estimates usually have been a theoretical determination of the gross additional amount consumers must pay in a given period because of the increase in prices resulting from limitations on supply imposed by the restriction. The total cost of such restrictions to a nation may be lower than the cost to consumers because some of the consumers' loss may be redistributed to producers in the country or to the government as a gain in revenue.

Tariffs or quotas raise prices of imports or import-competitive goods. This in turn leaves less consumer income for the purchase of other goods and services. Part of the loss to consumers is redistributed to producers, who have less import competition and may thus gain windfall profits. With tariffs, another part of the loss to consumers is transferred to the government as tariff revenue collected by the government. A third component of the loss to consumers is simply a deadweight loss for consumption. This loss reflects consumer purchases of less satisfactory products and the movement of factors of production from higher to lower productivity pursuits.

In terms of net costs to a nation, the use of quotas involves higher costs than the use of tariffs. With a tariff, the increased prices to consumers reflect revenue that is collected by the government. With quotas, although import prices may increase through restriction of supply, the benefit of increased consumer prices goes to foreign suppliers (or alternatively to importers) rather than to the government. According to

one estimate, nearly one-third of the net social costs to the United States of its quota restrictions is due to the transfer of this "tariff equivalent revenue" to foreigners.<sup>1/</sup>

In the short run, the full cost of a tariff or quota would not be recovered by the abolition of the restriction. Import restrictions distort market prices and cause the economy to operate at less than the optimal level of production. If import restrictions were lifted, and prices were consequently lowered for imported and import-competitive goods, the factors of production would shift to a more efficient mix. During this transition period, costs such as unemployment would temporarily reduce the increased net benefit of the abolition of the system until the more efficient system was fully implemented. Thus, the short-run cost of import restrictions is greater than benefits which could be achieved through abolition of the system. In the long run, the transition costs would disappear and the gains would be equivalent to the costs of the restrictions.

For illustrative purposes, some estimates which have been made of the consumer costs of U.S. quantitative restrictions are set out below. Because most other countries rely more heavily on international trade than the United States, the costs to consumers in those countries of quantitative restrictions maintained by their governments is said to be more burdensome, relative to their total incomes, than in the United States.

<sup>1/</sup> Stephen P. Magee, "The Welfare Effects of Restrictions in U.S. Trade," Brookings Papers on Economic Activity, Volume 3, 1972.

Table 8-D gives the value of U.S. imports in 1970 and 1971 in the major products subject to quantitative controls in those years. Imports of these products totaled \$8 billion in 1970 and \$11.1 billion in 1971. The increase from 1970 to 1971 is largely a reflection of the extension of controls to wool and manmade fiber textiles in 1971, imports of which are not included in the 1970 data because they were not then under control. The controlled products accounted for 24.5 percent of total U.S. imports in 1971. The commodities under control represent about \$100 billion of U.S. consumption and make up 15-20 percent of the entire consumer price index. <sup>1/</sup>

According to the Cabinet Task Force on Oil Import Control, the annual cost to consumers of quotas on oil imports (terminated May 1, 1973), totaled \$5 billion in 1969 and was rising by about \$300 million annually. Subtracting the elements of consumer cost that are transferred to other U.S. sectors, the annual social cost to the nation was estimated at \$1.5 billion. Another source estimated that quotas raised oil prices by 60 percent. For quotas on steel mill products, the net social cost was estimated at \$386 million. The controls on textiles (voluntary export restraints and quotas) are estimated in one analysis to raise consumer costs of these items by 10 percent or more;<sup>2/</sup> another analysis sets the

1/ Cotton textiles only. Wool and man-made fiber textiles were not generally under restraint in 1970.

Source: Imports compiled from official statistics of the U.S. Department of Commerce.

increase in consumer apparel costs at over \$1 billion annually.<sup>1/</sup> Still another estimate places the U.S. social cost of quantitative restrictions on textiles at \$1.25 billion annually and the cost to U.S. consumers at approximately twice that amount. Costs of quantitative limitations on textiles are expected to rapidly increase in the next few years.

A rough estimate of the U.S. annual social loss due to quantitative restrictions on sugar is \$403 million.<sup>2/</sup> The loss to the U.S. consumer is estimated to be at least \$500 million annually. Voluntary restraints on meat imports are estimated to cost the U.S. consumer \$350 million annually, with an annual social cost of \$12.5 million. The quotas on dairy products are said to cost the U.S. consumer \$500 million and the nation \$4.1 billion annually.

In sum, according to a 1972 study,<sup>3/</sup> the total net social cost of U.S. tariffs and quantitative restrictions is from \$3.3 to \$5 billion per year, about three-fourths of which is due to quantitative restrictions. The amount was attributed to major quantitative restrictions as follows: Petroleum, \$1.5 billion; textiles, \$1.25 billion; steel, \$0.4 billion; and sugar, \$0.4 billion. The study estimated, assuming an 8 percent rate of capitalization and a 4 percent rate of real economic growth, that the existence of quantitative restrictions would cost a growing annual sum in net social cost, totaling \$88 billion over the next 15 years (compared to a \$33 billion cost from tariffs). The amount of these costs that could

<sup>3/</sup> Stephen P. Magee, op. cit.

be recovered in terms of U.S. welfare if quantitative restrictions were abolished was estimated at \$37 billion in present value over the 15 year period.

The above estimate of the cost of quantitative restrictions probably underestimates the true costs of these restrictions due to factors which were not quantified: (1) The waste of production in protected industries under the present system, which may actually serve to worsen welfare even with economic growth; (2) welfare gains which would result from economies of scale in an expanded world market; (3) inefficiency resulting from protection of U.S. industries from competition; (4) and various miscellaneous costs. Miscellaneous costs are involved in the administration of the import restriction system. Furthermore there may be losses in real welfare involved in the transfer of revenue from consumers to the government (under a tariff system) and businesses (under a tariff or quota system). Government may not use the revenue as efficiently as consumers, and business may use funds to lobby for continued protection instead of to increase production of goods and services.

Patterns of Quantitative Trade Restrictions  
of the  
Major Trading Countries

The following pages describe and statistically analyze the broad patterns of quantitative trade restrictions among products and major trading countries. Some quantitative indication of a ranking nature is given of the countries and product areas where restrictions are most heavily encountered. Because quantitative trade restrictions are applied to specific products (unlike many other nontariff restrictions), their price effects can sometimes be determined.<sup>1/</sup> Nevertheless, the requisite data can seldom be assembled with a reasonable effort for measurement of the price and trade effects of quantitative restrictions. Consequently, an effort to measure such effects in this study had to be discarded as impracticable.

In the present study, an analysis was made of quantitative trade restrictions reported to the GATT by seventeen major trading nations, supplemented by data from other sources. The reported restrictions included only basic elemental forms of quantitative limitations--embargos, quotas, voluntary export restraints, licensing requirements, limitations deriving from state trading, minimum price requirements and mixing regulations; all of which can be identified in their application

---

<sup>1/</sup> When a standard or homogeneous product is under a quantitative restriction, the difference between the world price and the price in the protected market directly attributed to the trade barrier is sometimes easily determined. For example, under the recently terminated U. S. oil import quota system, "oil import tickets" were sold by holders of the import permits for a per unit price roughly equal to the difference between the world price and the U. S. price for petroleum.

to discrete categories of products. The available information on these restrictions was only of a "counting" nature; that is, a particular restriction was identified as either being or not being applied to a category of products (or part of a category). No information was available as to the possible price effects, trade effects, or production effects of a restriction.<sup>1/</sup> The data reflect the situation existing in the 1970-71 period. Since then, there have been significant changes in restrictions imposed by some countries.

---

<sup>1/</sup> The methodology used in the analysis is similar to that developed by Ingo Walter (see Ingo Walter and Jae W. Chung, "The Pattern of Nontariff Obstacles to International Market Access", Weltwirtschaftliches Archiv, Band 108, Heft 1, 1972). The procedures used by the Commission differ from the Walter procedure in at least 3 respects. First Walter counted only once any product category having one or more restrictions. The Commission counted each product category as many times as there were restrictions listed for the category. This counting method was used to try to provide a better indication of the strength of quantitative restrictions that are applied against items. It was based on the assumption that a case of more than one restriction against a product category probably means that items in the category are restricted more than if just one restriction applied. To the extent that this assumption is valid, the Commission's counting procedure may provide a better quantitative measurement of the restrictions than the Walter method. A second difference lies in the statistical groupings of data used. Walter aggregated to the two digit SITC level; the Commission used 32 product sectors based chiefly on aggregations of BTN headings. Consequently, a direct comparison of Commission results with Walter's results is very difficult on a disaggregated basis. Third, the Commission tried different weighting schemes in aggregating the specific restrictions. One scheme used different weights for different restrictions (table 8-E). Another counted a particular restriction as one half if it applied to only part of a BTN number. Also, three different weighting schemes were tried in aggregating counts of restrictions over product categories. One was to weight each product category equally, another was to use world trade weights for aggregation, and a third was to use own-country-trade weights for aggregation over product categories (where such weights were available). This study presents the aggregate results of the different weighting schemes. It also presents some detailed results using the world trade weights for aggregation, the restriction weights, and the scheme of not fully counting restrictions that apply to only part of a BTN category. Generally, however, results were similar for all weighting schemes tried. Finally, the Commission relied on rank correlation comparisons while Walter used simple linear correlation techniques.

Table 8-E lists the types of quantitative restrictions included in the count. Some, such as quotas, are more burdensome, or more significant than others, such as liberal licensing. This is crudely accounted for by a weighting scheme (the weights are given in column 2 of table 8-E). Most of the restrictions are self explanatory. In the analysis, export restraints were charged as a restriction not to the exporting country, but to the importing country, since it usually has forced the restraint on the exporter.

Table 8-E.—Types of Quantitative Restrictions Counted

Type of restriction	: Weighting : scheme <sup>1/</sup> : Percent
1. Bilateral quota-----	: 0.91
2. Global quota-----	: 1.36
3. Quota (unspecified)-----	: 1.36
4. Prohibited imports (embargoes)-----	: 1.36
5. State trading-----	: .91
6. Automatic licensing-----	: .45
7. Liberal licensing-----	: .45
8. Discretionary licensing-----	: .91
9. Licensing (unspecified)-----	: .91
10. Minimum price system-----	: 1.36
11. Seasonal restriction-----	: .91
12. Restriction (unspecified)-----	: .91
13. Export restraint-----	: 1.36
14. Suspended import restriction-----	: .91
15. Mixing regulations-----	: .91

<sup>1/</sup> Each restriction was given a number from 1 to 3, high or low, depending on its degree of restrictiveness. The average of these numbers was divided into the assigned number for each restriction, resulting in the weights shown in the table.

The data are presented at a quite aggregated level, the most detail given in terms of the 32 product sectors used for this study. Thus, any conclusions drawn are valid only when comparing these broad sectors. Behavior of the restriction patterns within sectors cannot be inferred from the data presented. Table 8-F lists the 32 product sectors, the

<sup>1/</sup> The product categories shown here are derived from the basic groupings of the Brussels Tariff Nomenclature, some of which have been further segmented into more precise categories. The data represent the number of these categories within each sector, information which is necessary for the calculation of the relative frequency of restrictions among the various sectors.

<sup>2/</sup> Due to rounding, figures do not add to the total shown.

Source: Compiled from basic documentation for the Tariff Study, GATT and national trade statistics.

number of subsidiary product categories in each sector, and the percent of world trade <sup>1/</sup> accounted for by each sector in the latter part of the 1960's. It should be noted that the percent of world trade has a pattern very similar to the pattern of product category numbers across the sectors. This is verified by a Spearman rank correlation coefficient of 0.7 between the two sets of numbers, indicating that the breakdown of product categories by sector roughly coincides with the relative amount of world trade in the various sectors. <sup>2/</sup>

The basic questions for which answers were sought at the 32 product sector level of data aggregation were the following: What are the patterns of quantitative restrictions across the 32 product sectors and across countries? How do the quantitative restriction patterns compare with those of tariffs across countries and product sectors?

---

1/ "World" trade is the total of imports of the following 16 countries: Austria, Belgium-Luxembourg, Canada, Denmark, Federal Republic of Germany, Finland, France, Netherlands, Italy, Japan, Norway, Sweden, Switzerland, United Kingdom and the United States.

2/ The purpose of the Spearman (after the inventor) rank correlation coefficient is to provide a rough measure of the association of two columns of numbers. This is done by examining how the ranks of the numbers in the two columns relate to each other. To calculate the coefficient, the numbers in each column are ranked and these ranks are then used in a standard formula. The range of the coefficient lies between -1.0 and +1.0. A coefficient of +1.0 would mean that the ranks of the two columns of numbers were identical thus indicating that the orders of the numbers in the columns are identical. At the other extreme, a coefficient of -1.0 would mean that the ranks were exactly opposite and that the orders of the numbers in the two columns were exactly opposite. A coefficient hovering around zero means that there is very little relationship between the ordering of the numbers in the two columns and thus very little relationship between the two columns of numbers themselves.

A brief summary of the data on quantitative restrictions and tariffs follows. These data will be used for comparison of the patterns of quantitative restrictions and tariffs.

#### Quantitative trade restrictions

A simple count of product categories subject to nontariff restrictions is given in table 8-G. There, for example, a "10" for Switzerland in restriction type 4 means that the Tariff Commission's list of quantitative restrictions indicates that Switzerland had embargoes on at least part of the items in ten product categories. An indication of the scope of the problem of nontariff restrictions in general and quantitative restrictions in particular is that the grand total count in the Tariff Commission's list is three thousand three hundred and fifty-eight restrictions.<sup>1/</sup>

Based on information in the Tariff Commission's list of quantitative restrictions, table 8-H gives 5 possible indicators of the degree of quantitative restrictions for 17 countries:

1. The number of product categories subject to some type of restriction in each country (column 2 of the table).
2. The total count of restrictions applied by each country (column 4 of the table). One product category may have more than one restriction, thus the numbers in column 4 are always equal to or greater than those in column 2.
3. The percent of world trade in the product categories which are restricted by each country (column 6 of the table).

---

<sup>1/</sup> The magnitude of the restriction count may be tempered by the possibility that more than one restriction applies to a particular product.

1/ The Spearman rank correlation coefficient matrix is given below. This matrix simply gives the pairs of coefficients between the various columns in a table. For example, the Spearman rank correlation coefficient for the numbers in columns 8 and 2 is 0.98 indicating that the ranks of the numbers in these two columns are almost identical. Certain statistical tests can be applied to determine whether a set of coefficients in a matrix are either significant or simply chance. Generally, coefficients close to zero are considered chance and therefore not statistically significantly different from zero. However if there are few numbers in a column, a larger coefficient may also be chance. All matrices presented will be accompanied by a note giving an absolute number, above which any coefficient can be considered as being statistically significantly different from zero with a certain probability (usually 95%). In the matrix below, coefficients are statistically significantly different from zero because they are above 0.2.

2	4	6	8	10	Column
*	0.98	0.91	0.98	0.90	2
	*	0.89	1.00	0.90	4
		*	0.89	0.94	6
			*	0.90	8
				*	10

2/ These percentages give the relative amounts of world trade appearing in the restricted categories. For example, Australia has 22 restricted categories and the world trade that would fall in these categories is 6.9 percent of total world trade. These percentages give a relative measure of the importance of the countries' restricted categories in terms of world trade falling within these groups of restricted categories.

3/ This index used the maximum amount of data available. The weights and adjustments were as follows: (a) total imports of major trading nations were used as weights to aggregate the basic product category data; (b) restrictions applying to only part of a product category were counted as one half the value of those applying to an entire category; (c) normalized weights were used on the various types of restrictions counting some types more than others (weights are shown in table 8-E).

Source: Compiled from data obtained from several U.S. government agencies, the GATT, national trade statistics, and public submissions to the Tariff Commission.

4. Actual restrictions applied as a percent of total possible restrictions which could be applied by each country (column 8 of the table). The maximum possibility is 15 types of restrictions for each of the 1,318 product categories, or 19,770.
5. The percent of total possible restrictions, weighted and adjusted, which could be applied by each country (column 10 of the table).

Ranks of the indicators also are given in table 8-H, and the Spearman rank correlation matrix for variables in columns 2,4,6,8 and 10 appears in a footnote to the table.

The data presented in column 10 of table 8-H makes maximum use of the information in the Tariff Commission's quantitative restriction list to calculate an index of such restrictions for the various countries. First, total trade weights (of major trading countries) were used to weight the data in the various product categories. This means that restrictions in a heavily traded category were counted more than restrictions in lightly (world) traded categories. This weighting puts this restriction index measure in line with the choice of the world trade weighted measure of tariffs for later comparative purposes. Second, if listed restrictions were applied to only part of a product category, they were arbitrarily counted only half as much as restrictions known to be applicable to an entire category. Finally, the various restriction categories were given the weights listed in table 8-E. This basically gives less weight to some categories, such as automatic licensing and liberal licensing.

The country ranks are very similar for all of the 5 indicators in table 8-H. This is confirmed by the high coefficients in the Spearman rank correlation matrix.

The index in column 10 does rank correlate best with the amount of world trade falling in restricted categories and it does insert maximum available information from the original list. It is chosen as the index to be used for later comparisons of tariff and restriction patterns. On the basis of the column 10 ranking, France exhibits the heaviest use of quantitative restrictions, followed by Italy, the United States, Germany, the United Kingdom, Japan, Netherlands, Belgium-Luxembourg, Canada, Austria, Norway, Portugal, Switzerland, Denmark, Ireland, Sweden and Australia at the low end.

Table 8-I gives a breakdown of the weighted and adjusted count of quantitative restrictions by the 32 major product sectors for 15 countries. It provides a more detailed look at the trade weighted restriction patterns in the various countries and sectors. The numbers in the table do reflect the amount of world trade occurring in each sector; i.e., given two sectors with an equivalent numerical count and pattern of quantitative restrictions, the sector with the larger total world trade will receive a larger number. From a mere glance at this table, the high concentration of quantitative restrictions in agricultural products is apparent, as is their heavy use in the industrial area by some countries.

Column 2 of table 8-J gives a summary of the row sums in table 8-I, calculated as a percentage of the total quantitative restriction count. The ranks also are presented. Column 4 gives the percentage distribution of world trade in the 32 product sectors. To the extent that these world trade weights are reflected in the counting of the quantitative restrictions,

1/ Individual product categories are weighted by total trade of major trading countries; restrictions applying to only part of a product category are counted as half the value of those applying to an entire category, and weights (see table 8-E) were applied to individual restrictions. This means that these sector counts are influenced not only by the number of restrictions of the product categories within the particular sectors, (whether or not the restrictions apply to entire product categories within the sectors) but also by the composition of the restrictions within the product categories.

Source: Compiled as noted from data obtained from several U.S. government agencies, the GATT, national tariff statistics and public submissions to the Tariff Commission.

<sup>1/</sup> Calculated from the row "totals" in table 8-I. These percentages are calculated from restriction units weighted by world trade as described in table 8-I.

Source: Compiled from data obtained from several U.S. government agencies, the GATT, national trade statistics and public submissions to the Commission.

columns 2 and 4 should be correlated. The rank correlation coefficient between them is 0.6 indicating that the trade weight "explains" about 60 percent of the pattern of the trade-weighted restriction patterns.

From table 8-J, it is seen that the sectors having the six heaviest concentrations of quantitative restrictions are foodstuffs; coal, petroleum, and natural gas; animals and animal products; grains; beverages and spirits; and textiles. These sectors account for 70 percent of the total trade-weighted restrictions and only 35.9 percent of total trade. The agricultural sectors, where restrictions generally are heavy, account for 68.3 percent of total weighted restrictions; in the industrial sectors, textiles plus coal, petroleum and gas account for 20.2 percent.

World-trade-weighted share indices of quantitative restrictions are presented in table 8-K. These indices are calculated from the trade weighted counts in table 8-I. The counts in table 8-I are calculated as a percentage of the total possible restriction count in each sector. Thus the data in table 8-K allow a comparison between the product sectors independently of sector size and are therefore the appropriate numbers to use when comparing counting indices of quantitative restrictions with sector tariff averages.

Average tariff patterns to be compared with  
quantitative restrictions

Table 8-L presents two tariff averages for 11 customs areas. The averages in column 2 are simple arithmetic means of all rate lines in each country's tariff. The averages in column 4 are derived by weighting the simple arithmetic means for each product category using as weights total trade of major trading countries. While the averages in column 2

1/ These indices are world-trade-weighted share indices. They are obtained from the data in table 8-I by calculating the world-trade-weighted and adjusted restriction counts as a percentage of the total possible weighted restrictions within each product sector. These indices allow comparisons of the relative incidence of restrictions between sectors as well as comparisons of the relative incidence of specific nontariff trade restrictions with the incidence of tariff levels across sectors.

<sup>1/</sup> The Spearman rank correlation coefficient matrix below for columns 2, 4, and 6 has all coefficients statistically significantly different from zero.

	2	4	6	Column
*		0.91	0.86	2
	*		0.83	4
		*		6

<sup>2/</sup> Simple arithmetic means of all rate lines in each country's tariff.

<sup>3/</sup> Simple arithmetic means of product categories weighted by total trade of major trading countries for each product category.

<sup>4/</sup> Tariff rate lines are weighted by own-country-trade weights.

<sup>5/</sup> These rank correlation coefficients are calculated for each country for the tariff averages in 32 sectors using the averaging methods of columns 2 and 4 of this table. All coefficients are statistically significantly different from zero.

<sup>6/</sup> Complete data were not available for calculating the own-trade-weighted average for Australia, but it is known to be higher than that of any other country listed.

<sup>7/</sup> This simple average lies halfway between the simple average of column 2--the unweighted country averages--and the simple average of column 6--the own-country-trade-weighted averages.

Source: Compiled from basic data for the Tariff Study, GATT and from national tariff schedules.

are generally higher than in column 4, the differences in ranks of the averages are small. This observation is confirmed by a Spearman rank correlation coefficient of 0.9 between the data in columns 2 and 4. Column 6 gives the own-country-trade-weighted tariff average. The rank correlation coefficients between the 10 observations in columns 6 and 2 and in columns 6 and 3 is about 0.8. Thus while the magnitudes generally differ for different tariff averaging methods, the country ranks are quite similar, indicating that rankings of broad categories (i.e., at the country level) are fairly insensitive to averaging methods.

The patterns presented by tariff averages vary substantially from commodity to commodity and country to country, but generally, the following observations are valid. Simple averaging may give higher averages because high prohibitive tariffs and high "forgotten" tariffs on goods that are no longer traded are given equal weight with the tariffs on heavily traded goods. At the other extreme, the use of own-country-trade weights gives small or zero weights to these tariffs (especially the high prohibitive rates) thus tending to lower the average. Many economists argue for the use of world trade weights in averaging to avoid these extremes. While the individual country averages in table 8-L do not always follow this pattern, the overall average of 10 countries combined does. The world-trade-weighted overall simple average in column 4 lies midway between the simple means of columns 2 and 6.

Column 8 shows Spearman rank correlation coefficients for each country for the averages of the 32 product sectors, using sector averages similar to those in columns 2 and 4. Thus, at the sector level, the

ranks are very similar in spite of differences in averaging methods.

On the basis of the above evidence, it was decided that world-trade-weighted average tariffs (column 4) would be satisfactory for rank comparisons with patterns of quantitative restrictions. The world-trade-weighted tariff average tends toward the middle of two extremes of different averaging processes (at least at the aggregate level) and it does rank correlate very well with averages derived from other weighting schemes.

Using the world-trade-weighted averaging scheme, the ranks of countries' tariff averages included in the table go as follows (from high to low): Australia, Japan, Austria, the United States, the European Community, the United Kingdom, Canada, Norway, Switzerland, Denmark and Sweden.

The relationship between tariff and quantitative  
restriction patterns on an overall basis

Table 8-M summarizes some data on the relationship of tariff levels and quantitative restriction levels, both on the overall country basis and for countries on the basis of the 32 product sectors.

Columns 2 and 4 simply repeat the country average tariffs and average quantitative restriction indices. There is a very weak rank correlation between the two columns (0.35) that has only an 85 percent probability of being statistically significantly different from zero. Therefore, on an overall basis between countries, there is only the weakest of hints that high tariff countries are also those with many nontariff trade restrictions. On the other hand there is no overall evidence that low tariff countries are the ones with the high restrictions.

Table 8-M.--The relationship between levels of tariffs and specific nontariff trade restrictions, by specified countries

Country	Tariff averages <u>1/</u>		Nontariff trade restriction indices <u>2/</u>		Spearman rank correlation coefficient between tariffs and specific trade restrictions for 32 product sectors <u>3/</u>	
	Percent ad valorem	Rank	Index	Rank		
1	2	3	4	5		6
Australia-----	15.3	1	0.36	15		0.05
Austria-----	11.4	3	1.30	10		.01
Canada-----	6.6	11	1.32	9		-.07

United States-----	7.9	4	3.18	3		.11

1/ World-trade-weighted tariff averages from column 4 of table 8-L.

2/ World-trade-weighted-specific nontariff trade restrictions indices from column 10 of table 8-H. The Spearman rank correlation coefficient between columns 2 and 4 is 0.35 and is statistically significantly different from zero with only an 85 percent probability.

3/ These rank correlation coefficients were calculated for each country for the tariff averages and restriction indices in 32 product sectors. The averaging methods used for the tariff averages and restriction indices were the same as for columns 2 and 4, respectively, of this table. Any rank correlation coefficient over 0.3 is statistically significantly different from zero.

Source: Compiled from data obtained from several U.S. government agencies, the GATT, national tariff and trade statistics and public submissions to the Tariff Commission.

Column 6 of table 8-M looks at the country comparisons of tariff levels in the 32 product sectors and frequencies of quantitative restrictions in these sectors. In general, the rank correlations are very weak for most countries. Only for France, Italy, Norway, and Sweden is there a weak positive (but statistically significant) relationship between sector tariff levels and sector frequencies of quantitative restrictions. Therefore, for these countries (and less so for some others if lower standards of acceptability of results are used), sectors with higher tariffs have a slight tendency to also have more quantitative restrictions. However, again there are no significant negative relationships. That is, among the 32 product sectors, no countries can be found which significantly use many quantitative restrictions to substitute for tariff restrictions in those sectors. Thus evidence also hints that quantitative restrictions do not substitute for tariffs on a broad product sector basis, but perhaps weakly complement tariffs.

The final bit of evidence was obtained by pooling (1) all countries' tariffs by sector and (2) quantitative restriction indices by sector to see if there was any significant overall relationship. This exercise generally confirmed the above observations. The overall (but statistically significant) rank correlation coefficient was only 0.17. This ratifies the above conclusion that on a broad basis, the application of quantitative trade restrictions only very weakly complements tariff restrictions.

It must be reiterated at this point that these conclusions are arrived at on a broad basis. They tell nothing about the possible uses of quantitative restrictions versus tariff restrictions within the particular product sectors.

Relationships of tariff height patterns and  
quantitative restriction frequency patterns  
across countries

A cross-country comparison of world-trade-weighted tariff rates for 32 product sectors is presented in table 8-N. All of the rank correlation coefficients between pairs of customs areas are positive and statistically significant indicating that tariff patterns are similar between countries, i.e., countries tend, broadly speaking, to protect the same products. However there is some variation in the strength of pairwise relationships between the various countries. For example, the relationship between the tariff patterns of Norway and Denmark is twice as strong as between Canada and Switzerland (a fact that perhaps could be expected).

The cross-country comparisons of quantitative trade restrictions are presented in table 8-O. Here there are generally the same positive patterns of quantitative restrictions across sectors between countries, indicating that among countries quantitative restrictions tend to be found on similar products. More variations in pairwise comparisons, however, occur in quantitative restrictions than in tariffs. There are also a few pairwise comparisons that are not statistically significant (most of Australia's comparisons with other countries are insignificant, but this may be due to the generally small number of quantitative restrictions documented for Australia).

<sup>1/</sup> Spearman rank correlation coefficients were calculated on a pairwise basis for the countries' 32 product sector world-trade-weighted share indices of specific non-tariff trade restrictions. These are the indices shown in table 8-K. Any coefficient above 0.3 can be considered statistically significantly different from zero with a 95 percent probability.

Source: Compiled from data obtained from several U.S. government agencies, the GATT national tariff and trade statistics, and public submissions to the Commission.

Comparison of tariff and quantitative restriction  
patterns across countries for 32 product sectors

Table 8-P gives the Spearman rank correlation coefficients for 32 product sectors between the tariff heights and quantitative restriction share indices for 15 countries. The relationship between tariff heights and levels of quantitative restriction frequency varies much from sector to sector and there are very few statistically significant relationships between them, the exceptions being positive ones in sectors I-1 (non-electrical machinery), I-8 (coal, petroleum and natural gas), A-6 (dairy products) and A-7 (fish and fish products). There are no significant negative relationships, but the relationship in toys hints that quantitative restrictions might slightly substitute for tariff restrictions among countries in this sector. For most of the 32 sectors, tariffs and nontariff restrictions follow no distinct pattern across countries.

General conclusions on the comparison of tariff  
and quantitative restriction patterns

Tariff patterns (heights) and frequency of quantitative restrictions are weakly similar across the 32 product sectors for countries in general, but for particular countries this relationship varies from being nonexistent to being slightly positive. For individual sectors the relationship (across countries) varies from being very weakly negative to being significantly positive; however the statistics for most sectors are in the insignificant range. Tariff patterns themselves are quite similar between countries. Patterns of quantitative restrictions are also quite similar between countries.

<sup>1/</sup> Spearman rank correlation coefficients were calculated for 32 product sectors between the tariff heights and the quantitative restriction share indices for 15 countries. The world-trade-weighting schemes of averaging were used for both the tariff averages and the share restriction indices for this calculation. A coefficient above 0.44 is considered statistically significantly different from zero with a 95 percent probability.

Source: Compiled from data obtained from several U.S. government sources, the GATT, national tariffs and trade statistics, and public submissions to the Commission.

# Import Licensing and Quantitative Restrictions in Developed Countries

Developed countries were the object of over 40 percent of the complaints dealing with licensing, quantitative restrictions, and similar practices submitted to the Tariff Commission in its survey of trade barriers. Quantitative limitations (including embargoes) drew the largest number of complaints, accounting for about two-fifths of the total against developed countries; licensing requirements accounted for about one-fourth; and export restraints and restrictive business practices each for about one-tenth of the complaints. Licensing requirements and quantitative restrictions are maintained in the following developed countries:

Australia	European Free Trade Area	Ireland
Canada	(of eight) and Finland:	Japan
European Community	Austria	New Zealand
(of six):	Denmark	South Africa
Belgium-Luxembourg	Finland	United States
Federal Republic	Iceland	
of Germany	Norway	
France	Portugal <sup>1/</sup>	
Netherlands	Sweden	
Italy	Switzerland	
	United Kingdom	

The countries listed, all of which were the object of complaints submitted to the Commission, were found to maintain approximately 1,000 licensing requirements and over 1,000 quantitative restrictions. In counting licensing requirements and quantitative restrictions for purposes of this report, a requirement for a type of licensing or a type of

---

<sup>1/</sup> With respect to development status, Portugal is a "borderline" country but normally considered to be a developing country. It is included here only because of membership in the EFTA.

quantitative restriction on all or part of the products in a BTN heading or subheading by a country is counted as one "licensing requirement" or "quantitative restriction." A country may have more than one type of license requirement (or quantitative restriction) applicable to products in a single BTN heading; each type is counted as one restriction.

There is, of course, a great deal of overlapping between license requirements and quantitative restrictions maintained in any particular country, but all license requirements are not for the purpose of quantitative controls and all quantitative restrictions do not involve licenses. In some cases where licenses serve solely as an administrative tool to allocate announced quotas, they were not reported in the data from which most of the information in the following discussion has been compiled. The United States, for example, has such administrative licenses for announced quotas on dairy products, and sugar. These licences, as well as "permits" necessary for the administration of health or sanitary regulations are not included in the data presented herein. However, the quantitative restrictions with which administrative licenses coincide are included and are discussed in detail.

#### Australia

Australia maintains 14 licensing requirements applicable to such items as unwrought aluminum, certain earth-moving equipment, tractors, and certain motor vehicles. All of the license requirements are the discretionary type. Australia maintains 10 quantitative restrictions, half of which are outright prohibitions (chiefly against sugar); one is a bilateral quota, two are global quotas and two quotas are of undetermined type.

Canada

Canada maintains 40 licensing requirements, 14 of which are the discretionary type; one is automatic, and 25 are of an undetermined type. Except for gasoline, methane, and casein, most license requirements apply to agricultural commodities. Canada maintains quantitative restrictions on products in 32 BTN headings or subheadings. Sixteen of the restrictions are outright prohibitions, 13 are export restraints administered by other countries, and the remainder are quotas of an undetermined type. The prohibitions are on such products as butter substitutes; animal feeds; used motor vehicles and aircraft; white phosphorus matches; copyrighted products; used periodicals; smoke-screen apparatus; side arms; used mattresses; and certain birds and animals. Some other products theoretically are allowed to enter under licenses but in fact are prohibited because licenses are not granted. Such items include certain dairy products and grains. Frozen turkeys at one time were under import quotas.

European Community (of six) 1/

Belgium-Luxembourg.--Belgium and Luxembourg maintain 34 licensing requirements, eight of which are the discretionary type; six represent liberal licensing; three are automatic; and 17 were not identified as to type.

---

1/ On January 1, 1973, the United Kingdom, Denmark and Ireland joined the European Community, raising to nine the number of member countries. Most statistical and other data for this report have had to be assembled in terms of EC membership prior to enlargement. To provide comparability with other parts of the report, licensing and quantitative restrictions in the Community are discussed in terms of the 6 original members only. Such restrictions which have been in force in the United Kingdom, Denmark and Ireland are discussed in a subsequent part of the report.

Although products originating outside the Community are generally considered as community products once they are imported and intra-trade theoretically cannot be restricted, trade in a few of these items is prohibited under the provisions of Article 115 of the Treaty of Rome.

A joint Belgium-Luxembourg commission administers the granting of licenses. In screening license applications for certain goods, especially agricultural commodities, the effect of imports on the domestic sector is considered.

All imports from certain Communist countries require licenses. Most licensed products from other countries are agricultural and food items. In the industrial sector, licenses are required on coal and lignite, some petroleum products, a few chemicals, penicillin and its preparations, chemical nitrogenous fertilizers, albumins, dextrans, a few textiles and textile products, some clothing, household linens, natural and synthetic precious and semiprecious stones and dust, some basketry, zinc plates, sheet and strip, and arms and ammunition.

Belgium and Luxembourg have 92 quantitative restrictions. Three of the restrictions are outright prohibitions; 31 are bilateral quotas; 35 represent export restraints by other countries on shipments to Belgium and Luxembourg; 12 are seasonal quotas applied to various flowers, fruits, and vegetables; and 11 other quotas were not identified as to type. The import quotas administered by Belgium-Luxembourg apply to coal, penicillin and its preparations, and a small number of agricultural commodities.

Federal Republic of Germany.--West Germany maintains 35 licensing requirements. Thirteen are discretionary, two are automatic, one is the liberal type, and 19 were unidentified as to type. Products requiring import licenses include bituminous coal, briquettes, solid fuels made

from bituminous coal, crude petroleum oils and oils obtained from bituminous minerals, certain heavy oils, and certain agricultural products.

West Germany has 145 quantitative restrictions. Forty-four are under bilateral quotas, 20 represent global quotas, four are outright prohibitions, 10 represent seasonal quotas, 35 are export restraints by other countries on shipments to West Germany, and 32 were unidentified as to type.

Most quota restrictions apply to agricultural commodities; however, a few industrial products such as tableware, certain fabrics and apparel, and certain ceramic products, are controlled by quotas.

France.--France maintains 115 licensing requirements. Eighty-eight of the requirements are the discretionary type, one is liberal, and 26 were not identified as to type. Licensing decisions generally are made on a case-by-case basis, in which authorities usually consider the essentiality of the commodity, the price, quality, delivery date, and any other relevant factor. Foreign exporters must ascertain before shipping that the French importer holds the requisite license. Licenses, generally valid for 6 months, normally may not be renewed or extended.

Among items which require licenses are most petroleum products, certain lubricating preparations, some prepared waxes, certain lubricant additives, mixed alkylenes, newsprint and paper for periodicals, micro assemblies for radio and television, transistors and semi-conductors, certain armored combat vehicles, certain aircraft, ships, clocks, and watches.

France has 171 quantitative restrictions. Sixteen of the restrictions are outright prohibitions; 46 are bilateral quotas; 48 represent export restraints by other countries on shipments to France; 13 are seasonal quotas applied to agricultural products such as potatoes, tomatoes, grapes, apricots, and melons; and 48 other quotas have not been identified as to type.

The prohibitions are applied to certain kinds of chemical fertilizers, tugboats, meat products, plants, wines and other spiritous beverages, and unmanufactured tobacco. The large number of products under bilateral quotas include synthetic organic dyestuffs, plywood, certain fabrics and carpets, gloves and mittens, certain garments, certain bed and table linens, sacks and bags, umbrellas, tiles, tableware, pig and cast iron, batteries, certain radio apparatus, insulators, tractors, certain boats, telescopes, cameras, toys, fish, certain specialty foods, jams and jellies, and preserved fruit. Quotas unidentified as to type for the most part apply to imports of agricultural commodities.

Netherlands.--The Netherlands maintains 31 licensing requirements. Seven of the requirements are discretionary, three are automatic, six are liberal licensing, and 15 were not identified as to type. Only a few imports requiring licenses are subject to quantitative restrictions. For some products not subject to license, such as certain petroleum shale oils, gas oils, fuel oils, sterile catgut and strings of gut for medical use, the importer must present a special document of registration. Licenses are valid for 6 months and importation must take place within this period, although extensions are permitted.

Import licenses are required on all merchandise from certain Communist countries. They are also required on certain agricultural products regardless of origin, as well as coal and certain products of coal, neutral sodium carbonate, penicillin, certain basketwork, certain mineral or chemical fertilizers, certain textile fabrics, certain processed wool or hair, cotton, jute, and synthetic fiber, yarn, jute sacks and bags, certain garments, pneumatic mattresses, wrought plates, sheets and strip of zinc and zinc foil.

The Netherlands has 54 quantitative restrictions. Two of the restrictions are outright prohibitions, 30 are bilateral quotas, 11 are seasonal restrictions applied to various flowers, fruits, and vegetables, and 11 are quotas of an undetermined type.

Italy.--Italy maintains 99 licensing requirements. Sixty of the requirements are discretionary, 16 are automatic, and 23 are licenses of an undetermined type.

Items subject to license when imported from the United States include milk, cream and sweet butter; dates, figs, and raisins in the bulk; pastes of dates, figs, or raisins; fresh wine grapes; grape must and wine; sugar beets, beet and cane sugar; carobs; acid oils from refining; saccharose syrup; molasses; certain fruit juices, vegetable juices; common salt; pure sodium chloride; sulphur; citric acid and crude calcium citrate; tetraethyl lead; certain anti-knock compounds; certain citrus oils; natural cork; and certain gold products. In addition, certain other items from the United States require "automatic licenses" which are granted upon request.

Italy maintains 163 quantitative restrictions. Eighty-two of the restrictions are under bilateral quotas, one is a global quota, nine are seasonal quotas, 42 represent export restraints by other countries on shipments to Italy, and 29 represent quotas of an undetermined type.

Most products under bilateral quotas are industrial products such as ethyl acetate; tetraethyl lead; certain dyestuffs; certain citrus oils; film; certain anti-knock preparations; certain tires; certain hygienic and pharmaceutical articles; various textile products; certain footwear; umbrellas; tiles; certain tableware; certain glass and glass products; alloy steel; internal combustion engines; sewing machines; electrical generators; certain batteries and various types of radio, television and electronic equipment; certain motor vehicles and motorcycles and parts thereof; and certain toys.

European Free Trade Area (of eight) and Finland 1/

Austria.--Austria maintains 48 licensing requirements, all of which are the discretionary type.

Austria has removed most of her quantitative import restrictions but still maintains 11 global type quotas.

Denmark.--Denmark maintains 104 licensing requirements. Eighty-two of the requirements are the discretionary type, 17 are liberal

---

1/ To provide comparability with data in other parts of this report, licensing and quantitative restrictions of countries which were EFTA members or associates prior to January 1973 are discussed here. On that date the United Kingdom and Denmark terminated membership in EFTA and joined the European Community.

licenses, and five were not identified as to type. Except for transmission belts, outergarments, tiles, tableware, glassware, unwrought gold and gold coin and knife blades, all license requirements apply to agricultural commodities.

Denmark maintains 36 quantitative restrictions. Fifteen of the restrictions are global quotas; 13 are bilateral quotas. Eight of the restrictions are seasonal restrictions applied to various fresh fruits and vegetables.

Finland.--Although most goods entering Finland are free of licensing requirements, an announcement during August 1973 made imports of certain categories of consumer goods including automobiles, motorcycles, boats and motors, radio and TV sets, stereo equipment, record players, refrigerators and ice boxes for home use, washing machines, sewing machines, and related household goods subject to import licenses. The value of such imports is estimated at only 5 percent of total imports and these controls are said to be temporary. Certain other goods which were already subject to import licenses are under global quotas annually established on a calendar-year basis. A small number of agricultural commodities, food preparations, and mineral fuels require individual case-by-case licenses. A nominal fee is charged for each license.

Finland's trade with Bulgaria, Colombia, Czechoslovakia, East Germany, Hungary, Peoples Republic of China, Poland, Romania, and the U.S.S.R. is controlled by bilateral agreements.

Iceland.--Most restricted items are admitted under global quotas that apply to all countries with which Iceland does not maintain bilateral payments agreements. Items on the restricted list include various agricultural products, cement, petroleum oils, certain crude and fuel oils, certain gasoline, certain ropes and cords, certain transformers, certain types of furniture, and certain brooms and brushes. All goods on the restricted list require individual licenses when imported from bilateral payments agreement countries; licenses for such imports are issued in accordance with bilaterally agreed quotas.

Certain items, including fertilizers, tobacco, matches, alcoholic beverages, fresh vegetables, and potatoes are only imported under state trading. None of these commodities, however, are subject to specified quantitative restrictions.

Norway.--Norway maintains 87 licensing requirements. Eighty-six of the requirements are discretionary; one is a liberal licensing requirement. Relatively few commodities originating in the dollar area are subject to import license regulations. Goods requiring licenses are generally under global quotas. These include certain ships' stores, certain rice, certain live animals, cheese, flower bulbs, tubers, cut flowers, certain plant parts, grasses, moss, foliage, glucose, ice cream, fruit and vegetable juices, fat emulsions, and egg albumin. For certain agricultural products licenses are granted only to the extent imports are needed to supplement domestic production to meet demand.

Norway maintains 56 quantitative restrictions. Twenty-nine of the restrictions are bilateral quotas, 18 are global quotas, and nine are seasonal restrictions.

Goods under global quotas include the following commodities: certain ships' stores, rice, certain live animals, certain cheeses, flower bulbs, tubers, cut flowers, certain plant parts, grasses, moss, foliage, glucose, ice cream, fruit and vegetable juices, certain fat emulsions, and egg albumin. Certain agricultural products are excluded if the relationship between domestic demand and domestic production is unfavorable for imports. Special decrees regulate imports for health reasons to prevent the spread of animal and plant diseases and parasites. These regulations apply to live animals, milk products, certain meat and animal products, living plants, fresh vegetables, edible roots, and certain seeds. Other regulations established for safety purposes govern electrical equipment.

Portugal. 1/--There are 42 licensing requirements on imports into Portugal. An import license is required for all imports valued at \$87.50 or more. Most products have been liberalized, which means that licenses for these imports are granted automatically. Licenses for nonliberalized products are considered on their individual merits (e.g., supply of domestic products, prices, and trade-agreement commitments.) Thirty-six of these license requirements are discretionary,

---

1/ Portugal is considered in most trade contexts as a developing country but is listed here under developed countries only because of her membership in EFTA.

two are liberal licensing requirements, and four were not identified as to type. Licenses are usually valid for 3 months. Foreign exporters must ascertain that Portuguese importers have licenses which will be valid on the day that goods arrive. Products which have not been liberalized include codfish, certain milk and cream, butter, potatoes, most cereals, cereal flours, starches, olive oil, groundnut oil, certain sugar, adhesives, cotton, cotton linters, sisal and other agave fibers, fishing nets, rubber footwear, certain types of cylinders, safety glass, glass bottles, carboys, glass beads, glass fiber, certain iron and steel tubes, pipes, clasps, buckles, certain rivets, certain circuit breakers, certain types of resistors and motor vehicles.

Portugal maintains 15 quantitative restrictions. Three of the restrictions are bilateral quotas against industrial products such as piping and tubing, apparel, and certain rubber products. There are 11 global quotas applied against such products as sugar, fish, and certain motor vehicles and parts. There is one prohibition imposed against imports of iron and steel and certain products thereof.

Sweden.--With the exception of a few agricultural and fishery products, practically all goods imported into Sweden from the United States and most other countries are free from quantitative restrictions and import licensing. Import licenses are required for goods imported from Japan, the Bonin Islands, the Ryukyu Islands, certain Pacific Islands under U.S. control, Albania, Bulgaria, the Peoples Republic of China, Czechoslovakia, East Germany, Hungary,

North Korea, Mongolian Peoples Republic, Poland, Romania, the U.S.S.R., and North Vietnam. Sweden maintains 24 licensing requirements. Fifteen are of a liberal type, six are automatic, one is discretionary, and two are of an undetermined type.

Sweden maintains 66 quantitative restrictions. Sixty-three are bilateral quotas applied to such products as sugar, gauze, bandages, various textiles and textile products, footwear, tiles, tableware, statuettes, and fish. There are two seasonal quotas (on apples, pears, etc.), and one prohibition on certain toys.

Switzerland.--Switzerland has 80 licensing requirements. Sixty-one of the license requirements are of a liberal type which usually are automatically granted, 17 are discretionary, one is automatic, and one is of an undetermined type.

Switzerland maintains 50 quantitative restrictions. Twenty-eight of the restrictions are global quotas, four are bilateral quotas, and one is a quota of an undetermined type. Most restrictions are applied against agricultural products. Ten of the 50 restrictions are outright prohibitions (chiefly against chemicals and chemical products) while seven others are seasonal restrictions on such products as tomatoes, onions, apples, pears, stone fruit, and certain berries.

Quantitatively restricted imports include such products as eggs, cut flowers, certain cereals, cattle, fresh or preserved meat and meat products, certain animal fats, fresh vegetables, potatoes, cotton and jute textiles, all kinds of clothing,

certain carpets, apples, pears, apricots, plums, cherries, wine, lubricating oils, specified chemicals, grape juice, fodder, wheat flour, alcohol, butter, powdered milk, bread wheat, and casein. Some products not quantitatively restricted also require import permits (i.e., products subject to health, plant quarantine, and veterinary regulations as well as those controlled by law and regulations concerning public morals and safety).

The primary objective of the quota controls is to protect Swiss agriculture and to assure a domestic supply of foodstuffs in case of need. All quantitatively restricted imports require import licenses. Import applications are examined individually and licenses are issued within unpublished quotas, which may vary from year to year, depending on domestic crops, production, and stock.

United Kingdom.--The United Kingdom maintains 10 licensing requirements. Four of the licensing requirements are discretionary and six are undetermined as to type. Unrestricted entry of most goods from the United States and other countries, except the Eastern Trading Area, is permitted under open general license, a privilege which allows British importers to enter goods without applying for a validated license.

The United Kingdom maintains 145 quantitative restrictions. Thirty-five of the restrictions are bilateral quotas, 22 are global quotas, and 26 are quotas of an undetermined type. Nine of the

restrictions are outright prohibitions against such items as hams, fish, sodium glutamate and steel traps; three are seasonal quotas against such products as tomatoes and onions. Fifty of the restrictions represent export restraints administered by other countries on shipments to the United Kingdom.

Import restrictions of primary interest to U.S. exporters are "global" quotas but in some instances specifically applicable only to the United States and other members of the dollar area, including Canada. Articles restricted under dollar area quotas include fresh grapefruit, canned grapefruit, frozen grapefruit, grapefruit and orange juice, rum, cigars, and bananas. These quotas originally were imposed when the United Kingdom had balance-of-payments problems, but the United Kingdom ceased to invoke this justification in 1960. It has been estimated that the trade loss to the United States resulting from dollar area quotas from 1960 to date exceeds \$60 million, with the current loss running \$10-15 million per year. Their continued existence has been one of the more contentious trade problems between the United Kingdom and the United States in recent years and in June 1973 an agreement was signed which provides for increases in the quotas over the next few years until a complete phase-out is achieved on most items by 1977.

Other items which are subject to annual import quotas are butter, butterfat, butter oil, coal, coke, coffee, certain bird feathers, certain firearms, fresh apples and pears, certain gold

medals, gold coins, certain hams, milk, certain animal food, certain fresh potatoes, certain radioactive substances, clover and grass seeds, certain sugar, certain jute manufactures, and shotguns.

#### Ireland

Ireland maintains 50 licensing requirements. Forty-nine of the restrictions are the discretionary type; one is an undetermined type. Licenses are necessary on a large number of agricultural commodities. Industrial items requiring licenses include private cars, buses, commercial vehicles, certain tractors, and bodies and chassis for these vehicles.

Ireland maintains 12 quantitative restrictions. Eight of the restrictions represent global quotas; the remaining four are seasonal quotas on such items as onions, apples, and tomatoes. The global quotas apply to such items as superphosphate; rubber tires and tubes; yarns, apparel, and piece goods; hose; vehicular springs and sparkplugs; electric lamps; and brooms and brushes.

#### Japan

All commercial imports into Japan, except those valued at less than \$200 and samples valued at less than \$1,000, require an import license, usually valid for 6 months from date of issuance. In practice, licenses for most imports are granted freely, but some items included on the "nonliberalized" list are subject to quantitative import restrictions. In 1963, the International Monetary Fund declared that Japan was no longer entitled to maintain import restrictions for balance-of-payments reasons. In recent years Japan has progressively reduced the number of

items on the "nonliberalized" list. In October 1969, there were approximately 118 items included on this list. A year later the number was down to 90 and by April 1973 down to 32. Table 8-Q lists the 32 BTN categories currently subject to quantitative import restrictions applied by Japan (at unpublished levels) contrary to the provisions of GATT and not covered by waivers.

The table indicates that there are eight industrial items remaining on the "nonliberalized" list, including digital computers, accessories, and components; certain integrated circuits; 1/ leather and leather footwear; coal, and ethyl alcohol. The remaining 24 items on the list are such agricultural products as beef, beans, peas, oranges, citrus juices, edible peanuts, and certain tomato products.

"Nonliberalized" commodities are subject to the Import Quota (IQ) system, which requires that the importer first apply to the Ministry of International Trade and Industry (MITI) for an import quota allocation certificate. If the certificate is granted (with or without conditions), the certificate entitles the holder to receive automatically an import license from an authorized foreign exchange bank upon application.

All remaining commodities were formerly imported under an Automatic Import Quota (AIQ) system and an Automatic Approval (AA) system. Under the former system, the importer applied to MITI for an import quota allocation certificate, which was usually granted automatically without restriction. Under the Automatic Approval (AA) system,

---

1/ In June 1973, the Japanese announced a plan to completely liberalize imports of integrated circuits in 1974 and computers in 1975. However, various other protective measures were being considered, such as financial assistance for the development of new computers, promotion of the use of computers by smaller businesses, etc.

Table 8-Q.--BTN categories currently subject to quantitative import restrictions applied by Japan (at unpublished levels) contrary to the provisions of GATT and not covered by waivers

BTN No.	:	Commodity description
	:	
EX 02.01	:	Beef
EX 03.01	:	Herring, cod, yellow tail, mackerel, sardines, horse mackerel, etc.
EX 03.02	:	Hard roe of cod and herring
EX 03.03	:	Scallops and cuttlefish
EX 04.01	:	Fresh milk and cream
EX 04.02	:	Milk and cream, processed
EX 04.04	:	Processed cheese
EX 07.05	:	Beans and peas
EX 08.02	:	Fresh oranges and tangerines
EX 08.11	:	Prepared oranges and tangerines
EX 11.01	:	Flours of wheat, rice, barley, and other grains
EX 11.02	:	Groats and meal of grain
11.07	:	Malt, roasted or not
11.08	:	Starches and inulin
EX 12.01	:	Ground nuts (excluding those for oil extracting purposes)
EX 12.08	:	Edible seaweeds
EX 14.05	:	Other seaweeds
EX 16.02	:	Prepared or preserved pork or beef.
EX 17.02	:	Grape sugar, milk sugar, and malt sugar not containing added sugar
EX 20.05	:	Fruit puree and fruit pastes
EX 20.06	:	Pineapple containing added sugar or spirit, fruit pulp, and roasted ground nuts
EX 20.07	:	Fruit juice (excluding lemon juice) and tomato juice
EX 21.04	:	Tomato ketchup, tomato sauce, and mixed seasonings, chiefly consisting of sodium glutamate.
EX 21.07	:	Food preparations containing sugar, beverage bases, peanut butter
EX 27.01	:	Coal
41.02	:	Cattle and horse leather
EX 41.03	:	Sheep and lamb skin leather
EX 41.04	:	Goat and kid skin leather
EX 64.02	:	Leather or fur skin footwear
EX 84.52	:	Digital computers and accessories and components
EX 84.53	:	Digital computers and accessories and components
EX 84.55	:	Digital computers and accessories and components
	:	

Source: Compiled from information supplied by the Japanese Embassy.

licenses were issued freely and without limitation by authorized banks without prior approval of MITI. Steps to simplify these procedures have resulted in the elimination of the AIQ system in February 1972 and replacing the AA system with a reporting system in December 1972. Liberalization was also recently made in the collateral requirements and the level of duty free allowance for travelers. However, importers who wish to pay for imported goods on terms different from the standard methods of settlement still must obtain advance government approval.

Because Japan is enjoying a very large trade surplus, complaints have become highly vocal concerning Japan's continuance of unwarranted quantitative restrictions on imports. In an effort to placate these complaints, Prime Minister Tanaka directed the Minister of Agriculture in March 1973 to study and make recommendations regarding liberalization of agricultural commodities, despite strong domestic opposition. It is believed that any such liberalization will be accompanied by domestic programs aimed at safeguarding farm income on a commodity-by-commodity basis. In the industrial sector, the main effort is being concentrated on computers. The Japanese government has announced that it will work toward eventual elimination of all remaining quantitative restrictions, with an interim expansion of those quotas still in existence.

Among moves to reduce its large trade surplus, in 1973 the Japanese government began controlling exports on an item-by-item basis with respect to price, amount, destination, and conditions of sale. However,

Japan has recently shown monthly trade deficits with both the United States and the rest of the world and certain of these self-imposed quotas are being discontinued.

#### New Zealand

About half of New Zealand's imports require some type of licensing. Similar goods receive the same treatment regardless of source: Most licenses are issued to importers according to a percentage allocation based either on the amount of their previous period's licenses or on the amount of actual imports made during a previous period. A few applications are considered individually and some are considered only in exceptional circumstances.

Under certain conditions, additional import licenses are issued to manufacturers for raw materials and components used in manufacture for export.

Importation into New Zealand of the following items is completely prohibited: Apples (except from Okanagan Valley, British Columbia), bees, birds' nests and bird-nest soup, chaff, feathers of protected birds, fish except tropical fish, hay, kumaras (except from Nive Island), live domestic poultry (except from Australia), molasses (except from Australia and Mauritius), moss (except sphagnum moss), noxious weeds, peat (except from United Kingdom and Eire), poultry meat, second-hand drums (except empty from South Pacific Islands and Antarctica), soil, sand and clay (except for manufacturing, scientific, or ballast purposes), straw, tortoises and turtles, used egg crates and fillers, and used sacks.

The following items are prohibited from some areas and subject to restriction from others: Animals, animal foods, animal hair, animal semen and ova, aviary birds, day-old chicks, turkey poults, ducklings,

pheasants, bananas, beekeeping appliances (used), biological products, birds, bone flour, bone meal, meat meal, boxes (for horses, cattle, dogs, cats, etc.), broom millet, bulbs, corms, tubers, the carcass of any bird, reptile, or mammal, citrus fruit, doctors' leeches, eggs, egg products and egg containers, feathers of unprotected birds, feathers for fly-tying purposes, fish (tropical), flowers, fruit, grapes, grape vines, herbarium specimens, hides, skins, lizards, meat and meat products, molasses, noodles, organisms causing disease, ova of salmon and trout, plants, potato tubers, research specimens, sausage casings, seeds, sheepskin rugs, skin drums, stored products, sweet corn and popcorn, timber, turtle shells, used vehicles (including tractors, earth-moving machinery, and associated equipment), vegetables, wheat, wool, (excluding that manufactured into articles suitable for sale to the general public), and zoological specimens.

#### South Africa

Except for a few items, imports from all countries require a prior import permit (i.e., license). The few exemptions include such items as samples of no commercial value, gifts under a specified value, and goods in transit. Goods subject to import licensing fall into 3 categories: (1) goods licensed "on the basis of reasonable requirements"; (2) vehicles subject to special controls; and (3) quota goods. Goods in the first category include capital equipment, industrial raw materials, maintenance spares and consumable stores, and specified consumer goods. Importers desiring to enter these goods must furnish details of previous purchases, current stocks and sales. The issuance of licenses is at the discretion of government authorities.

United States

The principal quantitative import restrictions applied by the United States are on certain agricultural commodities, textiles, vessels for use in coastwise U.S. trade, and, prior to May 1973, crude petroleum and petroleum products. The restrictions on agricultural products are imposed principally pursuant to Section 22 of the Agricultural Adjustment Act of 1933, as amended, the Sugar Act of 1948, as amended, the Agricultural Marketing Agreement Act of 1937, and the Meat Import Act of 1964. Restrictions on cotton textiles are applied under international agreements which have been negotiated under authority granted to the President by Section 204 of the Agricultural Act of 1956. The prohibition against foreign-built vessels in coastwise U.S. trade is contained in the Merchant Marine Act of 1920, and the limitations on petroleum were applied under the National Security Provisions of the Trade Agreements Extension Act of 1958 and the Trade Expansion Act of 1962. These major restrictions, and others of lesser significance, are summarized below. For international comparison purposes, U.S. quantitative restrictions totaled 188 in the counting method used in this report.

Section 22 of the Agricultural Adjustment Act, as amended.--For many years the United States has assisted the agricultural sector of the economy by supporting prices of specified agricultural products. If the support programs have resulted in domestic prices higher than world prices, imports, if not restricted, would increase and tend to depress prices. Hence, it was recognized that import limitations were necessary to prevent interference with the programs.

Import restrictions were initially provided for in 1935 by the addition of section 22 to the Agricultural Adjustment Act of 1933.

Most agricultural imports have not come under section 22 restrictions. Currently, section 22 import quotas are imposed on four products or groups of products: 1/ (1) Certain dairy products; (2) cotton, certain cotton waste, and semiprocessed cotton; (3) wheat and wheat flour, and (4) peanuts.

Sugar Act of 1948, as amended.--It is unlikely that any significant quantity of sugar would be grown in the continental United States if domestic production had to compete with uncontrolled imports of sugar. Since the sharp reduction in the tariff on sugar in 1934, a quota system has been used to annually allocate the quantity needed for domestic consumption to U.S. producers and a number of foreign countries. 2/ Under the sugar acts, domestic producers have generally supplied from 50 to 55 percent of the sugar marketed in the United States. Since 1962, mainland beet and cane areas have been allotted 65 percent in the annual growth in consumption requirements. During the 1964-70 period, imports charged against the U.S. import quota ranged between 3.6 and 5.2 million short tons.

---

1/ During 1973, the Tariff Commission at the request of the President instituted several investigations to consider whether import quotas on cotton fiber, cotton waste, certain cotton products (e.g., card laps); wheat and wheat mill products; nonfat dry milk and animal feeds containing milk or milk derivatives, cheeses and substitutes for cheeses; and butter and butter oil should be increased or suspended. As of December 31, 1973, investigations were in progress on wheat and wheat mill products, nonfat dry milk and animal feeds containing milk or milk derivatives, and butter and butter oil. Temporary increases in quota limitations were allowed during 1973 for cheeses, nonfat dry milk, butter and butter oil.

2/ Imports of sugar are not limited if used in the production of livestock feed or alcohol, or if to be exported or used in the production of goods for export.

The Secretary of Agriculture may also limit the importation of sugar containing products to a quantity which he determines will not substantially interfere with the objectives of the limitations on sugar. Beginning in 1972, imports of confectionery and certain sweetened chocolate were made subject to quota control.

Agricultural Marketing Agreement Act of 1937, as amended.--Marketing order programs for certain fruits and vegetables are authorized pursuant to the Agricultural Marketing Agreement Act of 1937, as amended. Under this authority, restrictions may be imposed which limit the size, grade, or quality of domestic products which may be permitted to be marketed. Such orders may not be issued until after public notice and opportunity for hearing by any interested persons. When restrictions are imposed on domestic marketings, the same general restrictions may be applied to imported products. In 1972 import requirements were applicable to 11 commodities.

The national security clause (section 232) of the Trade Expansion Act of 1962.--Since World War II the import trade in a number of commodities has been evaluated in light of the effect on national security, and legislative measures designed to ensure that imports do not impair the national security have been enacted. The main provision of law presently operative on this matter is section 232 of the Trade Expansion Act of 1962. Several domestic industries have sought to invoke the national-security provisions of the TEA, but only in the case of petroleum and petroleum products has such an appeal resulted in quantitative restrictions on imports.

For fourteen years, from the spring of 1959 until May 1973, mandatory quantitative restrictions were applied to imports of crude petroleum and petroleum products. 1/ Imports were regulated by licensed quota allocations to individual companies, based principally on the amount of domestic crude oil processed in the preceding year. Notwithstanding the import restrictions, aggregate U.S. imports of crude petroleum and petroleum products increased at a greater rate than domestic production of crude oil, due principally to increased imports of residual fuel oil, which became essentially decontrolled in April 1966. The ratio of imports to consumption in 1958-71 for crude petroleum ranged from 11-1/2 percent to 15 percent; for petroleum products (except residual fuel oil and petroleum asphalt) the ratio averaged between 2 and 6 percent.

In 1971, about 613 million barrels of crude oil were imported into the United States. In the same year U.S. imports of petroleum products including unfinished oils (other than residual fuel oil and petroleum asphalt) totaled 217 million barrels, and approximately 575 million barrels of residual fuel oil were imported. In 1971, about 43 percent of U.S. imports of crude petroleum came from Canada and about 2 percent from Mexico. 2/

---

1/ The mandatory restrictions were preceded by a Voluntary Oil Import Program, put into effect on July 1, 1957. Under the Voluntary Program, importers were requested to cut back imports of crude oil to a level 10 percent below their average annual imports in 1954-56. Late in 1958 it became evident that the Voluntary Oil Import Program was not accomplishing its purpose. Also, since finished petroleum products were not covered by the programs, imports thereof rose sharply. On May 1, 1973, the system of controlling the absolute quantity of imports by quotas was terminated and a license fee system instituted under which there are no absolute quantitative limitations.

2/ Imports from Mexico reported as crude oil are believed to be substantially all unfinished oils.

Restraints on meat.--Imports of fresh, chilled, or frozen meat of cattle, goats, and sheep (except lambs) are subject to the provisions of the Meat Import Act of 1964. The act provides that annual imports shall not exceed 725.4 million pounds, adjusted upward or downward by the same percentage that domestic commercial production changes in comparison with production during 1959-63. Consequently, as domestic production has increased during 1965-73, the basic limitation has increased each year from 848.7 million to 1,046.8 million pounds. Limitations are not required under the act until imports exceed the so-called trigger point--10 percent above the basic limitations. The level of imports remained substantially below this trigger point until 1968 when they increased sharply and threatened the imposition of quota limitations at the base levels.

The act provides that the quotas may be suspended if trade agreements entered into subsequent to the enactment of the legislation ensure that the policies set forth in the act will be carried out. Consultations were held in 1968 and voluntary restraints of exports to the United States were instituted which allowed annual imports of between 1 and 1.2 million pounds during the 1968-1972 period. However, on June 26, 1972, the President directed removal of restrictions for the balance of 1972 to assist American importers to obtain beef in world markets and slow down the increasing trend in meat prices. Similarly, on January 29, 1973, restrictions on imports were proclaimed for 1973 and immediately suspended.

Quotas under international agreements.--The United States imposes restrictions on certain imports under provisions of international agreements to which this country is signatory. In 1973, two such international agreements were in effect--the Long-Term Arrangement Regarding International Trade in Cotton Textiles 1/ and the International Coffee Agreement. 2/ Although the bulk of trade in products to which these agreements relate is controlled through export restraint measures, the successful operation of each agreement depends upon some measure of import restraint.

United States-Philippine Trade Agreement.--Under the 1946 trade agreement between the United States and the Philippine Republic, as revised, and the Philippine Trade Agreement Revision Act of 1955, imports of the following articles were made subject to absolute quotas as shown:

- (1) Sugars----- Annual quota of 952,000 short tons, of which not over 56,000 short tons may be in the form of refined sugar. 3/

---

1/ The LTA expired on December 31, 1973. It was subsumed by a multifiber "Arrangement Regarding International Trade in Textiles" which entered into force on January 1, 1974.

2/ The United States also "assists the governments of Taiwan and Korea in implementing limitations on their shipments of wool and man-made textiles to the United States under voluntary restraint agreements with these countries.

The United States monitors imports of steel to assist the European Community, the United Kingdom, and Japan in their "voluntary" restraints on exports of steel mill products to the United States.

3/ The quota allocated to the Philippines under the Sugar Act is invariably larger than that provided for in the Philippine Trade Agreement Revision Act, which provides that the sugar quotas established therein shall be without prejudice to any increases which the Congress might allocate to the Philippines. Hence, the absolute quota under the United States-Philippine Trade Agreement is inoperative and the Philippines actually participates in the U.S. sugar market to the extent authorized by the Sugar Act.

- (2) Cordage of hard fibers----- Annual quota of 6,000,000  
pounds each calendar year

The quotas were terminated on December 31, 1973.

Merchant Marine Act of 1920.---Under provisions of this act, foreign built vessels cannot be used in U.S. coastwise trade. Complaints have been lodged against this embargo by foreign suppliers of dredgers, tugs, hovercraft, and ships and boats.

Miscellaneous quantitative restrictions on U.S. imports.---In addition to the major U.S. import restrictions already discussed, imports into the United States of certain other articles are either prohibited entry or quantitatively controlled pursuant to various laws.

The Foreign Assets Control Regulations prohibit importations of merchandise of North Korean, North Vietnamese or Cuban origin not specifically licensed. Prior to June 1971, similar restrictions were in effect on merchandise from the Peoples Republic of China. The Rhodesian Sanctions Regulations prohibit the unlicensed importation of merchandise of Rhodesian origin. Products of Cuban, Rhodesian, 1/ North Korean or North Vietnamese origin are usually not granted licenses.

An embargo on seven types of furskins--mink, fox, muskrat, marten, weasel, ermine, and kolinsky--imported from the Soviet Union and the Peoples Republic of China is imposed pursuant to section 11 of the Trade Agreements Extension Act of 1951.

---

1/ Since January 1972, imports from Rhodesia of certain strategic and critical materials and ferrochrome produced from Rhodesian chromite have been allowed pursuant to a general license issued under the Rhodesian Sanctions Regulations.

Importation of articles using unfair methods of competition may be prohibited if the President determines the effect or tendency of such imports is to destroy or substantially injure an industry efficiently and economically operated, in the United States, or to prevent the establishment of such an industry, or to destroy or monopolize trade and commerce in the United States. Articles excluded under this provision in 1972 included certain lightweight luggage, certain panty hose, and furazolidone, all of which were covered by claims of an unexpired valid U.S. patent.

In addition, a number of import restrictions are imposed as necessary to protect the morals, health, safety, and security of the citizens of the United States or for the conservation of wildlife.

# Import Licensing and Quantitative Import Restrictions in Developing Countries

Of the complaints dealing with licensing, quantitative restrictions and similar practices submitted to the Tariff Commission in the survey of trade barriers, almost 60 percent were against developing countries. About one-third of such complaints concerned import licensing requirements encountered in LDC's, and slightly less than one-third were against outright import prohibitions or embargoes. Quotas and exchange controls were the next largest categories. Among the developing countries named in the complaints were those listed below.

## Latin America

Argentina  
Barbados  
Bolivia  
Brazil  
Central American Common  
Market (Costa Rica,  
El Salvador, Guatemala,  
Honduras, Nicaragua)  
Chile  
Colombia  
Dominican Republic  
Ecuador  
Guyana  
Haiti  
Jamaica  
Mexico  
Netherlands Antilles  
Panama  
Peru  
Surinam  
Uruguay  
Venezuela

## Asia

Afghanistan  
Burma  
India  
Indonesia  
Republic of Korea  
Malaysia  
Pakistan  
Philippines  
Taiwan  
Thailand

## Europe and Middle East

Cyprus  
Greece  
Israel  
Iran  
Jordan  
Kuwait  
Lebanon  
Malta  
Saudi Arabia  
Spain  
Turkey

## Africa

Arab Republic of Egypt  
Algeria  
Angola  
Central African  
Customs and Economic  
Union  
(Cameroon, Central  
African Republic,  
Congo, Gabon) and  
Chad  
Ethiopia  
Ghana  
Malagasy Republic  
Malawi Republic  
Mauritius  
Morocco  
Nigeria  
Rwanda  
Tunisia  
West African Customs  
Union  
(Dahomey, Ivory  
Coast, Mali,  
Mauritania,  
Niger, Senegal,  
Upper Volta)

Licensing and quantitative import restrictions encountered in exporting to the named countries are discussed, in alphabetical order by geographic area, in the following pages.

Latin America

Argentina.--There are no general import license requirements. However, special approval is needed for importation of live animals, internal combustion engines, passenger cars, certain other transport vehicles, certain tractors, automotive chassis, insecticides, veterinary products, foodstuffs, pharmaceutical products, and arms and ammunition.

Barbados.--Most items may be imported into Barbados under open general license but a limited number of products are under specific licenses granted on an individual basis. These include wholly and semimanufactured gold; belts, handbags and containers made of plastics; coconut meal; cottonseed meal; detergents; soap; eggs; fats and oils; poultry; prepared poultry feeds; fresh and frozen fish; macaroni, spaghetti, vermicelli, and other alimentary pastes; granulated sugar; lumber; aspirin; vitamins; sulfa tablets; phenobarbitol tablets; potatoes; fresh, frozen and chilled vegetables; and condensed, evaporated and dried milk.

Bolivia.--For importation of some goods a prior license must be presented at a Bolivian consulate with other documents for approval. These products include bacon, milk, wheat, rice, cereal, flour, malt, lard, tallow, vegetable oils, certain solid sugars, molasses, tobacco products, natural sulphate, crude petroleum, paraffin, carbides,

organo-sulphur compounds, polymeric products, regenerated cellulose, hardened albuminated materials, transformed natural resins, other polyethylenes, patches, tires, tubes, certain synthetic or artificial textile fiber yarns, certain construction machinery and vehicles powered by diesel engines.

Since April 1968, Bolivia has prohibited importation of a list of goods competitive with Bolivian industry. The prohibited list includes many consumer goods, pharmaceuticals, foodstuffs, wearing apparel, household goods, and certain raw materials. The usual requirements for prior authorization are placed on imports of firearms, explosives and other dangerous goods.

Brazil.--All goods imported into Brazil generally require one of two types of import licenses: (1) The import license for commodities which benefit from special tariff concessions, privileges or controls and (2) an import permit for the vast majority of other commodities. Licenses are valid for 120 days. To obtain a license, the foreign exporter is often required to furnish a pro-forma invoice and a list of prices. Import licenses for imports of automobiles and goods considered "superfluous" will only be issued when the exchange contracts are already closed.

#### Central American Common Market countries

The five members of the Central American Common Market (Costa Rica, El Salvador, Guatemala, Honduras and Nicaragua) all have some form of import controls which apply to most classes of the following commodities: Firearms, ammunition and explosives;

industrial or beverage alcohol or products used in the manufacture of either; seeds, plants and plant products.

In addition, El Salvador requires licenses for the importation of certain sugar cane, burnt sugar, certain burnt malt extract and caramel coloring, skins and leathers, certain liquors, distillery machinery, cotton for industrial use, jute packing and containers, coffee seeds and coffee plants for propagation, and labels for domestic and foreign goods. The importation of implements of war, material for the manufacture of certain wines, saltpeter, raw cane spirits, stamped cigarette paper, flour in used sacks, postage stamps, other fiscal stamps and documents and national coins, is reserved to the Government. Guatemala requires licenses for the importation of natural or synthetic rubber manufactures and semimanufactures.

Chile.--Import licenses are not required; however, importers are required to "register" all imports. Registration requires information of volume and value of imports of similar merchandise during the previous year. The importer must also submit a pro forma invoice which will verify that the price of the commodity being imported corresponds to its current price in the international market.

Colombia.--Most imports into Colombia are subject to import licensing by the Institute of Foreign Commerce. Licenses are required for all items which according to their tariff classification are neither on the "freely permitted list" nor on the list of prohibited imports. Items currently produced in Colombia in sufficient quantity and quality and those for which the Government desires to promote domestic production are either subject to import-limiting requirements or placed on the list of prohibited imports.

Dominican Republic.--Due to chronic balance-of-payments deficits, all imports require prior authorization and nonessential imports are controlled by exchange restrictions. In addition, specific import licenses are required for a few products such as fruits, plants, flowers, vegetables, wheat, wheat flour, semolina, and heavy construction machinery. Products exempt from import restrictions in general include medicinals, scientific and medical equipment and surgical instruments, veterinary products, livestock and poultry for breeding, agricultural equipment and implements, farm machinery and accessories, barbed wire, seeds, insecticides, fungicides, herbicides, fertilizers, industrial machinery and equipment, industrial containers, most raw materials, petroleum, and products thereof.

Ecuador.--All items permitted to be imported are on one of two category lists. List I consists of items considered essential; list II includes "semi-essential" or "luxury" products or items produced domestically in sufficient volume to satisfy demand. Products not appearing on either list are prohibited entry. Licenses are required for all imports except books, newspapers and periodicals. The importer must in some cases provide the seller's price lists and/or samples or, in some cases, a pro forma invoice covering the goods for which the license is sought.

The license requirement is waived under certain circumstances, such as equipment and materials destined for the development of national production when imported as investments by firms holding Government contracts.

Special authorizations are required for a number of imports, usually when the Government exercises some control over the production and distribution.

Guyana.--For most imports, an open general license is required, but a specific license is necessary for a few items including vegetables, cereals, meats, poultry, jewelry, gold, firearms, certain petroleum products and other fuels. Imports of the following products are prohibited: Matches, shaving and tooth brushes, base coin of any country, opium, fictitious stamps, infected cattle, food unfit for consumption and indecent articles. A number of other items are restricted. These include: Arms, ammunition, certain drugs, wines, spirits, tobacco, tobacco products, exotic fish, and certain films. Guyana prohibits all trade with Southern Rhodesia, South Africa, and Portugal and possessions. Trade with certain Communist countries is controlled.

Haiti.--There are no formal import licensing requirements although there are procedures for imposing import quotas or prohibitions where necessary to protect local industry. At present the following products benefit from such protection: Certain types of footwear, various household articles of aluminum or enamel, detergents, rubber heels and soles, various plastic articles, cotton fabrics, tomato paste, sugar, butter, flour, machetes, indigo, shoe laces, candles, and shoe polish. In the event of local shortage, these products may be imported with prior Government authorization.

In addition, imports of certain products are controlled by designated monopolies. These include fish, hardboard, cellotex, plywood, formica and corrugated roofing materials. Prohibited imports include used clothing, used household furnishings, old newspapers, and Christmas trees.

Jamaica.---Items prohibited entry into Jamaica include various animals, certain citrus and other fruit, clocks and watches. Most other goods from all countries (except Communist countries and South Africa) may be imported under general license. Approximately 150 items require specific import licenses, including specified food products, textiles, apparel, pharmaceuticals and synthetic detergents.

Mexico.---Mexico's general policy regarding imports is protectionist. Imports are controlled through a licensing system designed principally to encourage and protect domestic producers, to direct investment into economic sectors determined to require increased production, and to assure that foreign exchange is utilized primarily for essential imports. Major objectives are to replace imports with domestic products and to obtain sources of supply other than the United States. The Mexican Government requires that fixed minimum amounts of Mexican-made components be included in certain manufactured products. Tax exemptions are often granted to companies with a certain percentage of their products manufactured in Mexico.

Licenses are controlled and approved by various committees which represent the most important segments of industry. Import license controls apply equally to all countries and at first glance, the procedure might seem simple and uncomplicated. However, the vagueness of the rules for granting licenses causes a number of complaints from businessmen. Often the border is closed to products without explanation from the committee making the ruling and without adequate appeal. Firms are often forced to purchase Mexican products by withholding import licenses.

In recent years the Mexican Government initiated a campaign to reduce Mexican purchases in border stores on the U.S. side and to reintegrate the Mexican border zone into the economy of the rest of the country. Processing plants which have been established in Mexico along the U.S.-Mexican border (frequently specifically for utilization of the advantageous U.S. duty of TSUS item 807.00) are permitted duty-free importation into Mexico provided all of their end-products are exported. Adequate control must be exercised over such products to insure re-export.

Netherlands Antilles.--A license is required for all imports except those from European Community countries, the United Kingdom, Surinam, British and French West Indies, Guyana, and French Guiana. In practice, licenses are issued routinely except for a few luxury items such as tobacco products, alcoholic beverages and fireworks. Specific licenses are required for imports of hay, certain meats, live animals, birds, copyrighted books, certain base metal coins, parathion, certain explosives, and absinthe.

Panama.--Import quotas have been placed on a variety of goods, including fats and oils and other processed foods, toilet preparations, soaps, detergents and certain textiles.

Prior import licenses are required for a substantial list of products. Among the more important are specified products in the following commodity groupings: Fresh or dried fruits and vegetables, canned or preserved foods, beverages, textiles, clothing and footwear, and soaps and detergents. In addition, all food, certain chemicals and drugs, and beverage products must be approved by and registered before sale in Panama.

Peru.--Import licenses are not required except for firearms, explosives, textile machinery, animals, seeds, grains, plants and plant parts. Peru prohibits all imports of certain luxury and non-essential items, which include certain foodstuffs (meat, fish, vegetables, fruits, coffee, tea, cereals, flour, sugars), tobacco products, cosmetics, luggage, furs, paper products, carpets, clothing, shoes, glassware, jewelry, precious metals, kitchen appliances, radio and television sets, record players, watches, and certain automobiles. Imports of used machinery and equipment are prohibited except under special circumstances.

Surinam.--General import licenses are required on all commercial shipments entering from countries other than the European Community, Netherlands Antilles, Martinique, Guadeloupe, and French Guiana. They are issued routinely except for tobacco, alcoholic beverages, luxury items, and firearms.

A number of products are restricted and can be imported only with special government approval. These include certain edible oils, powdered milk, macaroni, vermicelli, certain fresh vegetables, bulk sugar, certain coffee, certain wood products, matches, and metal furniture. Quotas are applied on most women's apparel, wooden furniture, certain wood structures, wheat flour, dairy products, certain leather footwear, and certain types of athletic equipment.

Uruguay.--Although no import license per se is required, each import requires prior registration with exchange authorities. Imports are controlled by an extensive system of prior deposits.

Venezuela.--Certain imports, especially those similar to products domestically produced are subject to prior import licenses. Licenses are issued only up to the amount required to satisfy local demand.

#### Asia

Afghanistan.--Licenses are not required for imports into Afghanistan. The government prohibits imports of over 20 "nonessential" items to conserve foreign exchange; imports of some commodities are forbidden for religious, health, or security reasons (pork products, alcoholic beverages, some drugs, arms, and ammunition); and other products may be embargoed from time to time to protect domestic industry.

Afghanistan has bilateral trade and payments agreements with Bulgaria, Peoples Republic of China, Czechoslovakia, Poland, the USSR, and Yugoslavia. Trade with India and Pakistan is also subject to bilateral controls which impose quotas for individual commodities and schedules of commodities to be given trade incentives.

Burma.--All of Burma's foreign trade is directly controlled by the Government. Most major import orders are placed as a result of international tenders. Bids on tenders are submitted in German deutsche marks, U.S. dollars, British pounds sterling, French francs, and Swiss francs. Awarding of bids is based primarily on Burma's rigorous control of foreign exchange expenditures.

India.--India's shortage of foreign exchange has led the government to adopt an import policy under which importation of many goods is prohibited or limited by quota restrictions. The basic means of regulation is the requirement of a government-issued import license for practically all goods entering the country. Import licenses are granted to importers on a definite percentage of their base year imports as defined by the Import Trade Control Policy, issued effective April 1, and is valid for a 12-month period.

To be eligible for an import license, a person or firm must qualify as either an established importer or an "actual user." Established importers are generally companies or individuals in the import-export business prior to July 1952. Strict regulations make it difficult for firms to qualify as newly established importers. Most established importers have business connections with suppliers which extend over a very long period of time and to whom their first loyalty is pledged. It is very difficult for new foreign exporters to break into the line of established importers.

License priority is given to foodstuffs, capital goods, raw materials and other industrial goods needed for the development of India. Certain items which can be produced domestically are subject to quotas and/or embargoes and include: Spare parts for textile machines, power cables, certain tools, certain motor vehicles and asphalt.

Certain commodities are imported exclusively by state-sponsored corporations. These include mercury, sodium nitrate, and nitrate, palm oil, soybean oil, copra, mutton tallow, rock or mineral phosphate, X-ray film, certain nylon yarn, raw wool, wool tops, synthetic non-cellulose fibers, muriate of potash, sulphate of potash, sulphate of ammonia and corkwood. In addition, bulk imports for actual users of natural rubber, sulphur products, vitamins, antibiotics and the import of instruments and such materials as chemicals for use as proto-types are arranged through the state-sponsored corporations, who also act as an indent house 1/ for actual users of carbon black, aluminum oxide, phosphoric acids, titanium dioxide, and cellulose acetate.

Most imports require licenses. India does not maintain trade relations with South Africa, Southwest Africa, Rhodesia, Portugal, and Tibet.

Indonesia.--Only five import items are prohibited and import licenses have been eliminated.

Republic of Korea.--An import license, valid for 90 days, is required for every transaction and before a letter of credit can be opened in favor of a foreign supplier. All applications for import licenses must be accompanied by firm offers issued by foreign suppliers. Invoices are then checked to determine that offer prices do not exceed maximum import prices set by the Government. Commodities may be freely imported if not included on the "negative list." Prohibited items on the negative list include processed foods, apparel, certain

---

1/ Importers who import only upon definite orders received from domestic buyers.

paper wares, and some luxury goods. Restricted items on the list include selected foods, domestic appliances, certain pumps, various chemical elements and compounds, varnishes, lacquers and some pigments, essential oils and resinoids, synthetic fibers and certain types of office equipment. Specific quotas are established for a number of these products. The importation of quota items is linked to the record of producers of domestic raw materials used for exports. This linked quota system is designed to encourage increased use of domestic raw materials by granting the exclusive right of import of attractive quota items to such raw material producers. To engage in foreign trade, firms must (among other things) export commodities valued at \$200,000 for larger firms and \$50,000 for smaller firms. This minimum export level must be maintained annually to qualify for renewal of a license.

Malaysia.--Most goods may enter West Malaysia under an open general license without a specific validated license for each transaction. Some articles are admissible only under a specific validated license which is used to restrict imports and for surveillance purposes. Goods from South Africa are not permitted entry. East Malaysia also allows most goods to be imported under open general license. Specific licenses are required to import goods manufactured in Communist bloc countries.

Pakistan.--The amount and composition of imports are strictly controlled by the central government. Using estimates of industrial requirements and information on Government approved new capacity and modernization in industry, the Government determines the broad allocations for commercial and industrial imports. Although there is a so-called free list, quantitative limits are imposed on letters of credit making the procedure tantamount to import licensing. The current free list consists of 14 essential industrial and agricultural products such as iron and steel, nonferrous metals, chemicals, fertilizers, and pesticides. This list covers 41 percent of private sector imports. About 17 percent of private import requirements must have licenses. Licenses are limited to established importers plus such newcomers as are admitted by the authorities. Some bonus entitlement vouchers are issued representing a certain percentage of a firm's exports and these may be exchanged for import licenses for a wide range of products on a bonus import list, including many nonessential items not otherwise importable. About 24 percent of private imports are met through this scheme. Importers may also obtain licenses by surrendering bonus vouchers with a face value equal to 50 percent of the value of the license applied for. This scheme is applicable to about 18 percent of private requirements. It can be used for most items of industrial raw materials, components, and maintenance spares. Imports into Pakistan from Israel, South Africa, Taiwan, India, and Rhodesia are prohibited.

Philippines.---In general, there are no formal licensing controls on imports. However, prior import approval is required for the following products:

(a) About 900 products classified by the Central Bank as unclassified consumer goods, semiunclassified consumer goods, and nonessential consumer goods. Importation of these goods is never approved; thus, in effect, they are banned;

(b) Completely-knocked-down automobile units; and

(c) All imports to be financed over a period exceeding 360 days; and

(d) All imports of machinery and equipment with a unit value above \$50,000.

A few imports are expressly restricted by law. These include onions, potatoes, garlic, cabbages, certain coffee beans, rice, corn, used clothing, and certain tobacco. All imports from Rhodesia, South Africa and countries with which the Philippines has no diplomatic relations are prohibited.

Taiwan.---All goods shipped into Taiwan require an import permit. Merchandise is divided into three lists: Permissible, controlled and prohibited. Goods on the permissible list include raw materials, capital equipment and essential consumer goods. Items on the controlled list include luxury goods, goods subject to regulation and allocation and goods which the Government determines to be produced locally in sufficient quantity and quality to meet domestic needs and whose factory prices are not more than 10 percent higher than c.i.f. prices of comparable imported goods. The prohibited list includes

narcotics and other articles usually excluded by most countries from importation, as well as a number of luxury and less essential goods. Licenses to import goods on the permissible list are granted liberally. Items on the controlled list are licensed restrictively while goods on the prohibited list may not be authorized for entry.

Thailand.--Three categories of items require import licenses:

(1) goods whose import is normally prohibited to protect local industries; (2) goods whose import is subject to a requirement for concurrent purchase of similar goods produced domestically; and (3) goods whose import is controlled for health, security or other reasons. Products which are regulated (in addition to being required to have licenses) include television sets, radio equipment, tobacco, certain plants, weighing and measuring instruments, playing cards, dangerous drugs, explosives, and arms and ammunition. Sugar may be imported only by one specified government agency and one semigovernmental organization. The import of gold for ornamental and industrial uses is restricted as an austerity measure.

#### Europe and the Middle East

Cyprus.--Most goods may be imported freely except from Albania, North Vietnam, North Korea, Bulgaria, USSR, Tibet, East Germany, Peoples Republic of China, Hungary, Poland, Romania, Czechoslovakia, Rhodesia, and South Africa. Individual import licenses are required for goods originating in these countries and for certain items from all sources. These are generally items competing with domestic

production or covered in bilateral trade agreements, including some agricultural products and processed foods, alcoholic beverages, and tobacco manufactures, textiles and textile products, cement, certain chemicals, certain chemical products, wood products, manufactures of base metals, and nonelectric machinery.

Greece.--A few items are subject to import controls. For one group of products, which are subject to ad hoc approval of import licenses issued by the Greek Ministry of Commerce, licenses are generally issued without any quantitative limitation. A second group of items, which includes machinery and mechanical equipment considered by the government to be adequately manufactured in Greece is subject to ad hoc import licensing requirements by the Ministry of Industry. Severe import restrictions are imposed on these goods for protectionist purposes. In addition, imports of certain state monopoly goods are controlled by the government. Monopoly items include potatoes, wheat, meslin, rye, barley, oats, maize, grain sorghum, buckwheat, various petroleum products, salt, emery, sulphur, copper sulphate, narcotics, saccharin, phosphatic and nitrogenous mineral and chemical fertilizers, cigarette paper, and playing cards.

Israel.--Certain consumption, semimanufactured, and investment goods of a type produced in Israel, accounting for about 38 percent of Israel's imports, are subject to an automatic licensing system.

The system was devised to introduce a measure of foreign competition to local manufactures and provides a means of monitoring the effect of such competition. About 8 percent of the country's imports are subject to individual import licensing. All commercial imports are restricted to registered importers. Firms may be approved as general importers, or limited to the importation of specific items.

Iran.---All imports are subject to control by the central government. In general, industrial and agricultural products and non-luxury consumer goods are authorized for importation. Certain specified commodities such as goods produced in Iran (but not in sufficient quantities to meet requirements) are authorized only with prior government approval. Full details of the transaction are required in order to receive a license and quantitative limits may be imposed. Certain commodities, such as tobacco and cigarette paper, are imported subject to approval of a state monopoly. A few commodities, primarily agricultural products, are governed by bilateral agreements and may be imported only from the signatory country.

Importers of machinery, technical equipment, transport vehicles, communications apparatus and household equipment, who are sole agents for such items are required to import spare parts sufficient to meet consumer requirements and maintain suitable servicing shops.

Unauthorized imports consist mainly of luxury items and goods produced in Iran in sufficient quantity for domestic needs. Imports of used commodities are generally unauthorized. However, unauthorized

goods may be imported if the government deems it necessary because of (a) a shortage of the protected local product; (b) failure of local producers to meet standard requirements; or (c) unfair price increases by local producers.

Prohibited items include certain photographic apparatus, transmitters, telephone apparatus, records, tapes, certain publications, commodities with misleading markings, lottery tickets, certain drugs, certain metal coins, and arms and ammunitions.

Jordan.--Imports into Jordan from Israel and Rhodesia are prohibited. With certain exceptions (notably Government imports, agricultural products from neighboring countries, imports covered by the Arab Common Market agreement, goods below a certain value, newspapers, magazines and books), all imported goods require an import license. Licenses are issued for the value of the merchandise and freight, but not insurance and loading expenses. A fee of 4 percent of the value of the license is charged prior to issuance of the license. Regulations are very specific on the individuals and organizations which are allowed to import goods.

Prohibited items include macaroni, used cars for commercial purposes, electric gambling machines and most cigarettes. Articles which can be imported only with special government permission include eggs, shaving cream, some chemical detergents, dry batteries, paints, and certain types of machinery.

Kuwait.--Licensing is required for all products except foodstuffs. The importation of flour and wheat is limited to one mill. Insecticides and ethyl alcohol must have special government permission to be imported. Imports of alcoholic beverages, used trucks, certain spiral welded steel pipe, certain medicines and certain types of oxygen gas are generally prohibited. The government has authority to impose additional restrictions to protect new industries. Imports from Rhodesia, Portugal, South Africa, and Israel are prohibited.

Lebanon.--Most commodities may be imported into Lebanon without a license, but for a number of commodities which are domestically produced, a license is required. These include foodgrains, flour, edible fats, certain fruit juices, canned apples, milk, animals, meat, sugar, cement, tiles, shoes, boots, certain women's clothing, certain textile products, glass, glassware, aluminum pipes and rods, kerosene, gasoline, fuel oil, crude petroleum and industrial machinery and spare parts. A few items are prohibited entry; e.g., noise makers, cyclo-matic acids, liquid milk, and poultry eggs. All trade with Israel and Rhodesia is prohibited.

Malta.--Items requiring import licenses include many agricultural commodities, matches, certain mattresses, certain metal manufactures, candlesticks, crucifixes, certain mirrors, certain paints, peat moss, certain plastic foam products, prefabricated houses, certain printed matter, certain smoker's articles, soap, detergents, steel wool,

certain textiles, certain tiles, toilet paper, suitcases, used tires and motor vehicles, venetian blinds, washing soda, certain paintings, gold bullion, and certain marble and marble work. All goods imported from Eastern area countries require licenses.

Saudi Arabia.--Few licensing controls and no quantitative restrictions are imposed on imports. Cigarettes, tobacco, tombac, jurak, cigarette paper, drugs and medical supplies may only be imported by persons licensed to deal in these products. Imported hunting arms require prior licensing; other arms, ammunition and war material may be imported only by the government. Certain items are banned as offensive to the Muslim religion. Imports from Rhodesia, South Africa, and Israel are prohibited.

Spain.--Most imports, including raw materials, semimanufactures, machinery, and chemicals, are classified as liberalized and may be imported from OECD countries without licenses and are free of quantitative restrictions. If prices are suspected to be abnormally low, customs declarations may be withheld pending a full investigation.

Certain agricultural products, some raw materials and certain commodities over which the state has a monopoly are state traded.

Nonliberalized goods require an import license. Global quotas are set for these goods, which may be imported freely from OECD countries up to the limit of the quota. Some effort has been made in recent years toward complete liberalization and some quotas have been increased. However, if applications for a given quota exceed

the announced amount, Spanish authorities still may refuse some applications totally or partially. Occasionally licenses are granted well in excess of the quotas originally announced.

Turkey.--A license is required for all authorized imports which are classified in two categories: (1) The free list and (2) the quota list. Generally, items not appearing on either list may not be imported. The free list contains goods essential to running the economy but not locally available. Investment goods for export oriented industries also appear on the free list. Licenses are issued automatically for free list items.

Imports of items on the quota list are limited to global monetary quotas allocated either to industrialists importing for their own use or commercial importers. The list contains quotas for individual commodities as well as allocations for assembly and manufacturing enterprises, for government departments, and for emergency requirements. Some manufactures can receive foreign exchange allocations for imports in an amount up to 50 percent of certain exports.

With the exception of rotary printing presses, all used or reconditioned goods are prohibited.

#### Africa

Arab Republic of Egypt.--Imports of new personal effects exceeding a specified value and imports not requiring the transfer of foreign

exchange are subject to import licenses. All other imports are regulated through exchange allocations. Imports from Israel, Rhodesia and South Africa are prohibited.

Algeria.--Under new regulations issued as of June 1971, all goods being imported into Algeria require either prior licensing or "specific" licensing for goods on the contingency list. Of specific interest to U.S. manufacturers is the inclusion on the contingency list of chemicals, rubber products, certain textiles, industrial machinery, and a wide range of technical equipment such as business machines, telecommunications equipment, and geophysical instruments. Goods prohibited entry into Algeria include fancy feathers, flowers, soft drinks, granite, carpets, umbrellas, a certain range of jewelry, and a selection of items in the "luxury" category.

Angola.--All imports except those originating in Portugal and Portuguese Overseas Territories are subject to licensing. Import licenses are granted, in most instances only for commodities not manufactured in Portugal or the Overseas Provinces, though some items which are so manufactured can be imported in restricted quantities. Imports are usually authorized if foreign exchange is available. Certain specified products which are also produced locally, such as tires, electric wiring, beer, and certain radio equipment require special authorization even when imported from Portugal and the Overseas Territories. Imports of medicines and goods essential for economic development have not been subject to restrictions regardless of currency area from which they may come.

Preference is given to imports from GATT members and non-GATT countries with which Portugal has concluded trade agreements.

Central African Customs and Economics Union (UDEAC) and Chad.--

Licenses are required for virtually all imports into UDEAC countries (Cameroon, Central African Republic, Congo, Gabon) and Chad which are not goods produced in and exported from European Communities or franc zone countries. Under terms of the Yaounde Convention of Association with the European Community, imports from the EC and most associated African countries receive preferential tariff treatment and quota allocations.

Ethiopia.--With the exception of arms and ammunition, import licenses are not required. However, certain luxury items and locally-produced goods may be imported only against proof of payment. In addition, special permits are required for the importation of firearms, ammunition, matches, and cigarette lighters. Tobacco imports are controlled by a government tobacco monopoly.

Ghana.--All commercial shipments into Ghana require a specific import license, issued to a registered Ghanaian importer.

Policies followed in granting licenses give first preference to capital and producer goods needed for development of the country. Essential consumer goods come next, followed by goods which compete with products manufactured locally. For certain goods on a "restricted" list, import licenses are issued to individual applicants only under "very special circumstances." This list includes certain luxury foods

and manufactures, such as home air conditioners and automobiles, and other consumer goods such as used clothing, manmade fibers, and cement.

Another group of commodities are on a "banned" list for which "under no circumstances" will import licenses be issued. These commodities are those deemed to be produced or capable of being produced in Ghana in sufficient quantity to supply the populace. These include some foods, alcoholic beverages, paints, polyester foam, paper bags and boxes, plywood, cigarettes, and radios.

Malagasy Republic.--All imports from countries outside the franc area, other than liberalized commodities originating in European Community countries, are subject to import licensing. A few items (such as edible oils, batteries, used empty barrels, used jute bags, and used clothing) from any source are subject to licensing. Annual global quotas are established for commodities originating from countries outside the franc area. Long delays are often experienced in importing American products because detailed license application forms are not properly filled out, and there is reported to be a strong tendency to deny import licenses for dollar zone goods which can be imported from France and the franc area.

Malawi Republic.--Goods imported from sterling area countries require no import licenses, except for a short list of items requiring specific import permits. A limited number of goods (including lubricating oils, greases, gasoline, exposed movie film, mineral oils, fuel oils, and certain kerosene) may be imported from any country without a license.

Goods requiring specific import licenses when imported from any country include sugar, wheat flour, cement, certain uniforms, gold, certain knives, used clothing, game traps, bird nets, firearms, ammunition, explosives, radio-active substances, poisonous and dangerous drugs, game trophies, and stills. Prohibited goods include certain tobacco, certain spirits, and seditious matter. Most goods imported from the United States have entered under open general license.

Mauritius.--Most goods from the United States require specific import licensing. Licenses generally are readily available and are valid for 1 year. Most imports from Britain and other members and former members of the British Commonwealth may be imported without an import license. However, some 39 restricted commodities require an import license when imported from any source.

Morocco.--Importation of goods for which local production covers domestic needs and certain nonessential products is prohibited. Agricultural and industrial products which are in insufficient supply to meet local demand as well as goods which are subject to import control for "technical and commercial" reasons require certificates of importation and are quantitatively controlled.

Essential products not produced locally, certain foodstuffs, raw materials and semifinished products for local industries, equipment for agriculture and industry, luxury consumer goods subject to high tariffs, low demand items and products normally exported by Morocco

may be imported without import licenses but only by persons or firms that have been exercising (for at least 1 year) trade in the goods in question. Government agencies maintain a monopoly over the importation of tea, sugar, tobacco, and tobacco products.

Nigeria.--Many goods are imported under open general license, but over 90 items accounting for 15 to 20 percent of Nigerian imports require specific import licenses. These include air conditioners, refrigerators, some textiles and piece goods, rice, developed movie film, automobiles, palm by-products, meat products, coal and coke, petroleum products, articles of gold, second hand clothing, cotton and cotton by-products, peanuts and by-products, soybeans, cement, certain vaccines, keymaking machines, certain gambling machines, tear gas, poisonous cyanides, and live fish.

Rwanda.--Import licenses are required for all commercial imports, primarily for statistical purposes. Restricted items include dangerous drugs, flick knives, and similar classes of merchandise. An open general license permits importation of certain petroleum products and butane gas from specified countries.

Tunisia.--Most goods imported into Tunisia from non-European Community or non-franc zone countries require a specific import license. Licenses are relatively easily obtained for liberalized goods, which consists of capital goods and certain raw materials considered essential. The granting of a license is, however, subject to the availability of foreign exchange. Other goods are licensed on the basis of global quotas or quotas under bilateral

trade arrangements. Products under global quota are quite limited in number. Imports of some 90 commodities from any source are severely restricted and may be imported only with a specially authorized individual license. Such goods are generally considered to be manufactured domestically in sufficient quantities to meet local needs. Included among these are beer, wine, textile fabrics, footwear, tractors, and furniture. Certain goods are imported only by state monopolies. These include tobacco, matches, playing cards, imports from the United States under U.S. Public Law 480, coffee, tea, sugar, and fruit. Other commodities, such as timber, paper and various metallurgical products may be imported only by certain importers. Imports of luxury consumer items are discouraged. Trade with South Africa and Southern Rhodesia is prohibited.

West African Customs Union (UDEAO).---Through the Yaounde Convention of Association between the European Community and several African states, UDEAO member states (Dahomey, Ivory Coast, Mali, Mauritania, Niger, Senegal, and Upper Volta) favor imports originating in the French franc area and the European Community. Each government draws up an annual import program within which import licenses are issued. For imports from countries outside the European Community and franc zone, the annual import program establishes a quota for bilateral commercial agreements and a global quota. With the exception of a small group of prohibited goods, all imports from France and the franc zone may be imported without licensing or certification requirement. <sup>1/</sup> All imports from other foreign countries,

---

<sup>1/</sup> Some of the Customs Union nations apply similar treatment to other EC countries.

including those from the United States, are subject to import authorization, consisting of either import licenses for merchandise subject to quotas, or import certificates for merchandise which is "decontrolled," i.e., not subject to quotas. The list of "decontrolled" products consists largely of raw materials and semi-finished goods which are not important in the trade with the United States.

Import licenses are issued only to licensed traders and in exceptional cases, to industrial or agricultural producers who are considered end-users of the imported merchandise. Private persons cannot obtain import licenses except for transactions not involving foreign exchange. Licenses are issued for specific types of goods and substitution of another type of goods is strictly prohibited.

## "Voluntary Export Restraints" and Other Export Controls

Perhaps one of the more outstanding innovations of the twentieth century in the nontariff barrier field is the voluntary export restraint. Most other trade distorting practices discussed in this report have been known and utilized for many years, if not centuries, but the phenomenon of countries "voluntarily" limiting their own export trade to lessen competition with producers in another market exhibits a new approach to an ancient problem.

Hong Kong, India, Japan, Korea, Malaysia, Pakistan, Poland, Singapore, Trinidad, Tobago, and Yugoslavia have registered complaints against their GATT trading partners about "voluntary" export restraints. They contend that such limitations are resorted to only as a means of avoiding the application of more stringent import restrictions by the country requesting the voluntary restraint. Japan has claimed that many of her "voluntary" restraints imposed on exports to the United States reflect actual threats or pressures growing out of anti-dumping or escape-clause investigations, boycott campaigns, and the introduction of import restriction bills in Congress, and that most "voluntary" controls have been implemented after bilateral consultations with U.S. Government officials. Such restraints are "voluntary" only in the sense that the exporter agrees to adhere to restrictions on its exports without exercising rights of compensation which it would have if the restrictions were imposed by the importing country.

Defenders of the "voluntary" approach argue that restraints are applied by exporting countries when they feel it is in their best

interest to do so. The voluntary action has frequently been taken under negotiated terms which allow for periodic increases on which the exporting industry can depend and plan accordingly. It is often far less disagreeable for an exporting country to administer the controls in order to assure that the impact is equitably distributed among its producers. The exporting country has the continued option of reopening negotiations on voluntary controls, but can exert little influence on a foreign government to alter a unilaterally applied quota.

The effects of "voluntary" restraints on exports are identical in many respects to import restrictions. In at least one respect, however, they are more discriminatory than import restrictions in that they do not always control trade into a market from all sources. This was particularly true in the case of cotton textiles, where Japan began controlling exports to the United States as early as 1956, while other exporting countries substantially increased their share of the U.S. market. Many contend that voluntary quotas on exports to the U.S. market are a means of establishing protectionist devices without the necessity of justifying the claim of import injury under the statutory escape-clause criteria. It is argued that export restraints allow the true offending country (the requesting importer) to escape blameless and without retaliation. Some domestic consumer groups argue that such restraints limit competition and raise prices in the domestic market

and have challenged some arrangements in court under antitrust laws. <sup>1/</sup> Steel and textiles have been the outstanding examples of "voluntary" trade restraints in recent years.

#### Restraints on textiles

Beginning in the 1950's, international trade in textiles has come under increasing quantitative controls, principally in the form of "voluntary" restraints by the exporting countries. All major importing countries (Europe, the United States and Canada) have sought "voluntary" restraints by the major exporters.

Section 204 of the Agricultural Act of 1956, as amended, authorizes the President of the United States, whenever he determines it to be appropriate, to negotiate with representatives of foreign governments to obtain agreements limiting the export from such countries to the United States of any agricultural commodity or product manufactured therefrom or textile or textile product. He is authorized to issue regulations governing entry or withdrawal from warehouse of any such imported commodity, product, textiles, or textile products to carry out any such agreement. In addition, if a multilateral agreement exists among countries accounting for a significant part of world trade in the articles concerned, the President may also issue regulations controlling trade with the United States in products of countries not parties to the

---

<sup>1/</sup> During January 1973, a U.S. District Court stated that such voluntary agreements are not exempt from antitrust legislation. The Government has appealed the opinion to a higher court. In addition, during January 1973 a suit was filed in a District Court charging The Commerce Department with violation of the Freedom of Information Act in connection with its administration of textile quotas. It is charged that the public is not allowed sufficient participation in the establishment of restrictions. However, this case was settled out of court when the Commerce Department agreed to the demands made by the consumer's group.

agreement. The existence of this legislation is the authority for certain agreements limiting exports to the United States and is the basis for numerous consultations conducted with foreign governments to develop some restraining action on shipments of particularly sensitive items. This authority has been used not only as the basis for formal bilateral agreements but also as the catalyst to persuade foreign producers and governments of the advisability of "voluntary" restraints on sensitive exports to the United States. Some restraints are maintained "voluntarily" to avoid a formal agreement which might be more restrictive. Some governments fear that formal agreements bind their shipments and allow third parties to increase their share of an import market.

American importers claim that trade restrictions on textiles and apparel impose an exorbitant cost on U.S. consumers, and that these costs substantially outweigh any real or imagined benefits which domestic industries may have received from the protection. It is estimated that restraints on textiles and apparel annually cost the American consumer \$1 billion.

Cotton textiles.--World trade in cotton textiles has been very largely controlled since 1962 under the provisions of the Long-Term Arrangement Regarding International Trade in Cotton Textiles (LTA), which was negotiated under the sponsorship of the General Agreement on Tariffs and Trade (GATT), principally in response to demands from the United States. The LTA is a multilateral agreement among some 30 nations having a substantial interest in international trade in cotton textiles. Prior to the LTA, Japan had (since 1957) voluntarily controlled its

exports to the United States of a wide range of cotton textile items, and Italy had controlled its exports of cotton velveteen to the United States. However, shipments of cotton textiles to the United States were neither comprehensively nor equitably controlled by these early efforts. The overall purpose of the LTA was to guarantee to all textile-producing nations a share of the markets of the major importing nations, including the United States, without disrupting the market for any particular category of products.

The arrangement was the direct result of promotion by the United States. The LTA became effective October 1, 1962, initially for a period of five years; it was extended twice, first in 1967 and again in 1970, each time for three years. <sup>1/</sup> Under the LTA, countries experiencing domestic market disruption resulting from cotton textile imports can control the level of such imports by implementing the provisions of article 3 of the LTA. An importing country can request an exporting country to limit shipments of the cotton textiles causing disruption. If the exporting country does not accede to the request within 60 days, the importing country can impose an import quota on the specified products at levels specified in the agreement; annual quota increases (usually five percent) are provided for if the restraints remain in force for additional 12-month periods. Exports of participating countries cannot be restrained more severely than exports of nonparticipants.

---

<sup>1/</sup> The LTA expired on December 31, 1973. It was subsumed by a multifiber "Arrangement Regarding International Trade in Textiles" which entered into force on January 1, 1974.

Article 4 of the LTA permits mutually acceptable bilateral trade agreements which regulate cotton textile trade on terms not inconsistent with basic objectives of the LTA.

(1) Restraints on exports to the United States.--During existence of the LTA, the United States has shifted away from use of article 3 restraint actions toward increased use of bilateral agreements. For example, in the first 12 months of the LTA the United States invoked the article 3 unilateral restraint provisions 115 times, but only four bilateral agreements involving the United States were in effect. During the second year, the article 3 restraints decreased to 67, while bilateral agreements involving the United States increased to 13. Since then there have been fewer restrictions under article 3 while bilateral cotton textile agreements involving the United States came into effect with 30 governments by 1972, compared to 8 agreements under article 3 (see table 8-R). Twelve countries control their own exports; all imports from eight countries are controlled by the United States; in 16 cases, trade is controlled partly by the exporting country and partly by the United States. Imports of cotton textiles from all of these countries accounted for over 85 percent of total imports of such products during 1971.

Under the LTA, U.S. imports of cotton textiles were permitted to increase from 1.1 billion equivalent square yards during 1960 to a peak level of 1.8 billion during 1966, an increase of 64 percent. They declined to 1.5 billion square yards in 1967 and remained between 1.5 and 1.7 billion square yards during 1968-71. Average U.S. imports of cotton products during 1966-71 was about 600 million square yards above

<sup>1/</sup> Import data for textiles wholly of or in chief value of cotton have been grouped into 64 categories of products. These categories are used by the United States in administering the provisions of the LTA and in reporting trade activity in each group. All categories from all countries are subject to limitation whenever market disruption exists; categories listed are those on which limitations were actually in force as of April 1, 1972. In those cases where an aggregate limitation applies to all categories from a country, smaller limitations apply to each category.

<sup>2/</sup> Many bilateral agreements for countries listed superseded numerous restraints under article 3 of the LTA. Where applicable, the aggregate quantities shown for each country reflect increases (usually by 5 percent per 12-month period) above limitations imposed during the first agreement year and further annual increases are authorized until each agreement is terminated or expires.

<sup>3/</sup> Includes wool textile products, other than apparel, in the amount of 0.2 million equivalent square yards, and manmade fiber textile products, other than apparel, in the amount of 2.1 million equivalent square yards. Imports of apparel of wool or manmade fibers are controlled under a separate bilateral agreement.

<sup>4/</sup> Imports of certain uniquely and historically traditional Indian products are not limited by the agreement.

<sup>5/</sup> Not all items in all 64 categories are under restriction.

<sup>6/</sup> Nine-month period.

the level of imports during 1960. Operation of the LTA has reduced the tendency for imports to be concentrated in particular items.

(2) Restraints on exports to other countries.--Under the LTA, there has been only one limitation on U.S. exports of cotton textiles (Italy, 1965), but there have been a large number of restrictions imposed on cotton textile trade between other countries. Restraints by European countries, Canada, and Australia have been directed primarily toward the principal textile exporters of Asia. However, there are exceptions, such as Canada's restriction on certain textile products from Greece, Mexico, Spain, and the Arab Republic of Egypt.

Restrictions by the European countries predate the LTA, and go back to the 1950's and early 1960's. As early as 1958, an agreement between Austria, Switzerland, Norway, and the European Community countries restricted re-export to each others' markets of cotton fabrics imported duty free in the gray from Japan, Peoples Republic of China, India, Pakistan, and Hong Kong. During the 1950's, France and Austria applied an almost complete restriction on imports of cotton textiles from most developing countries. West Germany restricted imports of several important items. Italy, Belgium, Netherlands, Luxembourg, and the Scandinavian countries restricted imports of most cotton items from Japan. The United Kingdom concluded bilateral agreements during the 1950's with India, Pakistan, and Hong Kong which limited exports from those Commonwealth countries.

Most restrictions maintained in the 1950's were carried into the 1960's and some were incorporated into the machinery of the LTA. However, many restraints between countries other than the United States

have gone beyond provisions of the LTA in that they are more comprehensive in coverage, applying not only to cotton products but also manmade fibers and wool. There is some indication that restraints of other importing countries have diverted shipments to the U.S. market. On the other hand, there are several examples where U.S. exports have retained a significant share of a market where trade from a third party was restricted.

Since inception of the LTA in 1962, a number of countries have entered into agreements to restrain trade in textile products, both of cotton and other fibers. Although it is sometimes difficult to determine whether the trade is actually controlled by the exporting or importing country, the fact that both nations agree to the limitation qualifies the restriction as a "voluntary" export restraint. These restrictions are summarized in table 8-S.

Wool and manmade fiber textiles.--U.S. imports of manmade fiber textiles increased 1,300 percent during 1964-71, from 328 million equivalent square yards to 4.3 billion. There is evidence that this increase has been the direct result of shifts away from cotton during the 1960's as a result of the LTA. Imports of wool textiles (except floor coverings and rugs) fluctuated between 115 million and 192 million equivalent square yards during 1964-71, a period of sharp declines in production by U.S. industry. Prior to 1970, no countries controlled their

Table 8-S.—Limitations imposed during the past 10 years on textile trade between foreign countries

Importing country	Exporting country	Restricted product
Australia	Hong Kong	Cotton drills, cotton denims, and knitted shirts
Austria	Egypt, Japan, India, Israel, Pakistan, Mexico, Korea, several Communist countries	Various products
Benelux	Japan	Cotton, wool, and manmade textiles
	Hong Kong	Cotton shirts, woven nightwear, handkerchiefs, bedlinens, household linen, and terry cloth
	India, Pakistan	Cotton textiles
	Several Eastern European countries, U.S.S.R.	Wool and manmade fiber fabrics and manmade fiber clothing
Canada	Israel, Portugal, Greece, Colombia, Mexico, Spain, Egypt, Brazil, Korea, Hong Kong, India, Taiwan, Mainland China	Cotton yarn
	Hong Kong, Japan, Taiwan, Macao, Korea, Malaysia, Singapore, Poland, Romania, Trinidad/Tobago	Certain fabrics, made-up goods, and apparel (of various fibers)
Denmark	Egypt, Japan, Korea	Various products
European Community	Japan, India, Pakistan, Hong Kong, Taiwan, Egypt	Various products
France	Japan, India, Pakistan, Hong Kong, Korea, Egypt, Argentina, Australia, Brazil, Burma, Ceylon, Chile, Cuba, Czechoslovakia, Dominican Republic, Haiti, Hong Kong, India, Indonesia, Israel, Japan, South Korea, New Zealand, Nicaragua, Pakistan, Peru, Poland, South Africa, Uruguay	Various products
West Germany	Japan, India, Pakistan, Taiwan, Egypt, Korea, Japan, Taiwan, South Korea, Singapore, India, Pakistan, Egypt, Yugoslavia, Bulgaria, Czechoslovakia, Hungary, Romania, Poland	Various products
Italy	Japan	Various products
	United States, Spain, Egypt, Hong Kong, Taiwan, India, Pakistan, Yugoslavia	Grey and bleached fabrics
	Albania, Czechoslovakia, East Germany, Poland, Bulgaria, Hungary, Romania, U.S.S.R.	Wool products
		Certain manmade fiber products
Finland	Some Eastern countries	Various products
Norway	Japan, Korea, Hong Kong	Yarn, fabrics, certain knitted fabrics, cotton undergarments, shirts and nightwear; wool jackets, sweaters and cardigans; manmade fiber anoraks, shirts, sweaters, jackets
	Japan, Bulgaria, Poland, Romania, Czechoslovakia, Hungary, U.S.S.R., South Korea, Portugal, Macao, Hong Kong	Wool and manmade fibers
	Bulgaria, Czechoslovakia, East Germany, Hungary, Poland, Romania	All textile fibers
Sweden	Japan	All textiles
	Portugal, Macao	Wool and manmade fiber textiles
	Singapore	Shirts
	Korea	Certain wool and manmade fiber apparel
	Bulgaria, Czechoslovakia, East Germany, Hungary, Poland, Romania, U.S.S.R.	Various products
	Hong Kong	Wool and manmade fibers plus other various products
United Kingdom	Hong Kong	Various products, including polyester/cotton fabrics
	Japan, Bulgaria, Czechoslovakia, Hungary, Poland, Romania, The Peoples Republic of China, U.S.S.R., East Germany	Wool and manmade fiber products
	India, Ireland, Israel, Japan, Malaysia, Spain, Yugoslavia, certain Eastern Area countries, Pakistan, Taiwan	Various products

exports of wool fabrics to the United States. <sup>1/</sup> As a result of increased pressure from the industry, the U.S. Government pursued efforts to obtain restraints on wool and manmade fiber products similar to those on cotton products under the LTA. Long and difficult negotiations were conducted with the principal exporters and agreements with five countries were eventually reached. Agreements with Hong Kong, Korea, and Taiwan became effective October 1, 1971, to control exports of wool and manmade fiber textiles to the United States for a period of five years. A similar agreement with Japan became effective on the same date for three years. Malaysia signed an agreement for four years beginning September 1, 1970. The level of restraint for each of these countries

---

<sup>1/</sup> In 1963, the Virgin Islands began efforts to control shipments of wool fabrics shipped through them to the United States from another country (Italy) but processed sufficiently in the Islands to qualify for duty-free status as the product of an insular possession on entry into the United States. Fabrics of reprocessed or reused wool are imported into the Virgin Islands and, after undergoing a showerproofing process, are shipped to the U.S. mainland as products of the Islands. Imports of such fabrics into the United States began in February 1962, and amounted to 6.4 million linear yards for that year. After many protests in the United States, the Government of the Virgin Islands established annual production quotas by means of a tax of 65 cents per linear yard on showerproofed woolen fabrics, among other textile items, manufactured or processed in the Virgin Islands in excess of a quantity (to be determined by the Governor) "consistent with the protection of the economic stability and commercial relations of the Virgin Islands." Production within the limits of the quota are taxed at only one cent per linear yard. The annual quotas determined by the Governor during the 1963-72 period have fluctuated between 1 million linear yards in 1964 and 5 million in 1963. Simultaneously, shipments to the United States have ranged between 594,000 linear yards in 1967 and 5 million in 1963.

is shown in table 8-T. The five countries with which the United States now has agreements accounted for over 60 percent of the U.S. imports of manmade fiber textiles and over half of wool textiles during 1971.

Table 8-T.--Quantitative limitations on U.S. import trade in textiles of wool or manmade fibers pursuant to bilateral agreements <sup>1/</sup>, as of April 1, 1972

Products restrained	Country of Origin	Limitations on import trade		Limitation controlled by--
		For 12-month period beginning--	Aggregate quantity (million equivalent square yards)	
Apparel of wool <sup>2/</sup> -----	Hong Kong	Oct. 1, 1971	40.0	Hong Kong
Apparel of manmade fibers <sup>2/</sup> -----	Hong Kong	Oct. 1, 1971	210.0	Hong Kong
Textile products, of wool-----	Korea	Oct. 1, 1971	12.7	Korea and U.S.
Textile products, of manmade fibers--	Korea	Oct. 1, 1971	344.3	Korea and U.S.
Textile products, of wool-----	Japan	Oct. 1, 1971	42.8	Japan
Textile products, of manmade fibers--	Japan	Oct. 1, 1971	954.7	Japan
Textile products, of wool-----	Malaysia	Sept. 1, 1971	.1	Malaysia
Textile products, of manmade fibers--	Malaysia	Sept. 1, 1971	5.4	Malaysia
Textile products, of wool-----	Rep. of China	Oct. 1, 1971	4.7	Rep. of China and U.S.
Textile products, of manmade fibers--	Rep. of China	Oct. 1, 1971	467.5	Rep. of China and U.S.

<sup>1/</sup> Agreements with Hong Kong, Korea, and Republic of China (Taiwan) are for 5 years beginning Oct. 1, 1971; the agreement with Japan is for 3 years beginning Oct. 1, 1971; and the agreement with Malaysia is for 4 years beginning Sept. 1, 1970.

<sup>2/</sup> Limitations on wool and manmade fiber products other than apparel are included under the bilateral agreement with Hong Kong negotiated under the authority of the Long-Term Arrangement Regarding International Trade in Cotton Textiles (LTA) effective Oct. 1, 1970.

### Restraints on steel

The rapid increase in U.S. imports of steel throughout the 1960's prompted discussions which led to the announcement by Japan and the European Community of "voluntary" restraints on their steel exports to the United States for the 1969-71 period. The arrangement has been extended for an additional three years through 1974 and now includes the United Kingdom. The eight countries now participating in the arrangement accounted for approximately 85 percent of total steel mill products imported into the United States in 1971.

Under the current arrangement, Japanese producers will restrict exports of steel mill products to the United States during 1972 to

6.5 million tons, and will limit the annual increase to 2.5 percent in 1973 and 1974. Producers in the United Kingdom and the European Community will limit their combined exports in 1972 to 8.0 million tons; exports to the United States in 1973 will not be more than 1 percent above the 1972 limit and those in 1974 will not be more than 2.5 percent above the 1973 limit. The overall restraints include specific quantitative limitations for each of the participants on specialty steel--stainless, tool, and other alloy steel--in each of the years 1972, 1973, and 1974, and limits exports of cold finished bars and fabricated structural steel in 1972 to 2.5 percent above 1970 exports and to an annual increase of 2.5 percent thereafter. There will also be efforts to maintain the geographic pattern of distribution of exports to the United States that existed during the 1969-71 period.

During 1972, a consumer group filed suit in a U.S. District Court seeking injunctive relief from restraints under the Steel Arrangement. It was charged that artificially high steel prices are the result of these restraints and therefore they have violated the Sherman Antitrust Act. It was also alleged that the actions violated the Trade Expansion Act of 1962, which calls for a Tariff Commission finding of injury before remedies can be imposed. The Court denied the injunction on the grounds that the firms acted in good faith based on the assurances of U.S. officials that the agreement was legal. However, the Court stated that such voluntary agreements are not exempt from antitrust legislation and that "a flat agreement among private foreign producers mutually to limit a substantial amount of goods to be sold in the United States is a violation of the Sherman Act. . ." The Government has appealed the opinion to a higher court.

Restraints on Japanese exports (other  
than steel and textiles)

Japan is by far the principal country applying "voluntary" restraints to exports. In addition to the widely publicized export controls on the textiles and steel products, lesser known controls have been exercised for some time over a wide range of goods exported to many countries. During the past few years, some 25 items, other than textiles and steel, have been subject to quantity and price controls when exported to the United States. Japan's exports of these items to the United States totaled about \$500 million in 1970, or about nine percent of Japanese exports to the United States.

The avowed purposes of the controls are to maintain orderly shipments or orderly marketing. However, they are more often a means of preventing erection of more ominous trade barriers by the importing countries or preventing antidumping actions against Japanese products. Japan contends that no other country must enforce "voluntary" restrictions over so many export items. However, "voluntary" restraints apparently are considered preferable to other alternatives. Representatives of various U.S. interests have contended that the restraints by Japan on exports of so many products to so many destinations, and especially the major markets of Europe, have encouraged Japanese exporters to concentrate sales on the less restrictive U.S. market.

In 1971, Japan had quantitative controls on her exports of several dozen items to a number of countries (table 8-U), besides a long list of items over which she maintains both export and domestic shipment controls. Price and/or quality restrictions are maintained on exports to various

Table 8-U.--Japanese voluntary quantitative export controls on products, other than textiles and steel, by country of destination, as of July 1971 1/

Articles	Countries of destination
Bicycles-----	United States, Canada, and Mexico
Stainless steel knives, forks, and spoons-----	Benelux
Radios of six or more transistors-----	United States, Australia, Austria, Belgium, Canada, Denmark, W. Germany, Finland, France, Greece, Hong Kong, Ireland, Italy, Luxembourg, Malaysia, Netherlands, Norway, New Zealand, Panama, Portugal, Rep. of Korea, S. Vietnam, Singapore, Spain, Sweden, Switzerland, Taiwan, Thailand, and the United Kingdom

In addition to these more-or-less long standing export restraints, to reduce its large trade surplus, the Japanese Government in 1973 began to control additional exports on an item-by-item basis with respect to quantity, destination, price and conditions of sale. Among the large export items brought under control were automobiles, motorcycles, household electric appliances, radios, stereos, tape recorders, 35 mm cameras, 8 mm motion picture cameras and exchangeable lenses for cameras. However, Japan has recently shown monthly trade deficits with both the United States and the rest of the world and certain of these self-imposed quotas are being discontinued.

#### Restraints on meat

Imports into the United States of fresh, chilled, or frozen meat of cattle, goats, and sheep (except lambs) are subject to the provisions of the Meat Import Act of 1964. The Act provides that annual imports shall not exceed 725.4 million pounds, adjusted upward or downward by the same percentage that domestic commercial production changes in comparison with production during 1959-63. Consequently, as domestic production has increased during 1965-70, the basic limitation has increased each year from 848.7 million to 998.8 million pounds. Limitations are not required under the Act until imports exceed a so-called trigger point--10 percent above the basic limitations. The level of imports remained substantially below this trigger point until 1968 when they increased sharply and threatened the imposition of quota limitations at the base levels.

The Act provides that the quotas may be suspended if trade agreements entered into subsequent to the enactment of the legislation ensure that the policies set forth in the Act will be carried out.

Consultations were held in 1968 and "voluntary" restraints of exports to the United States were instituted which allowed annual imports of between 1 and 1.2 million pounds during the 1968-71 period. The burden of the restraint fell on Australia and New Zealand, the two major suppliers, which were required to reduce exports while other exporting countries were permitted to maintain prevailing levels.

More recent negotiations resulted in agreements which would have allowed imports of 1.2 million pounds of meat during 1972. The countries which were subject to "voluntary" restraints in 1972 and their levels of restraint were: Australia, 600.4 million pounds; New Zealand, 250.9 million; Canada, 80.0 million; Ireland, 74.7 million; Mexico, 78.2 million; Nicaragua, 44.8 million; Guatemala, 25.3 million, Costa Rica, 39.8 million; Honduras, 16.7 million; Dominican Republic, 12.5 million; Panama, 6.1 million; the United Kingdom, 5.0 million; El Salvador, 3 million; and Haiti, 2.6 million. However, on June 26, 1972, the President directed removal of these restrictions for the balance of 1972 to assist American importers to obtain beef in world markets and slow down the increasing trend in meat prices.

#### Restraints on strawberries and tomatoes

U.S. imports of strawberries and tomatoes from Mexico have increased significantly in recent years. Exceptionally heavy production of frozen strawberries during 1969 and 1970, resulted in greatly increased shipments to the United States. The record high imports and end-of-season carryover depressed prices in the Pacific Coast states where the bulk of U.S. frozen strawberries are produced. The

smaller Mexican strawberry crop due to adverse weather during the 1970/71 season reduced the critical nature of the problem, but return to normal growing conditions prompted Mexican growers to cut back strawberry acreage and export sales due, in part, to a fear that the United States might initiate import restrictions.

United States and Mexican officials began negotiations in the summer of 1971 toward an agreement to restrain strawberry exports to the United States. The Mexicans were urged to continue their efforts to "voluntarily" limit strawberry shipments to the United States for the mutual benefit of producers on both sides of the border.

The two Governments concluded an agreement which limited exports of frozen strawberries and strawberry paste and pulp to 82 million pounds in 1972.

Exports of tomatoes to the United States from Mexico, after being limited by the United States under a marketing order program, have been "voluntarily" controlled in recent years by Mexican producers. During the 1970/71 season an export quota was established at 180,000 metric tons.

#### Restraints on mushrooms

During the 1960's, Taiwan became the most important source for imports of canned mushrooms by the United States. Imports from that country rose from 300,000 pounds in 1960 to 16.6 million pounds in 1967. The prospect of even larger exports in 1968 led to the conclusion of an agreement whereby Taiwan limited exports to the United States to 18.6 million pounds. After 1968, the Government of Taiwan reduced export target levels and production incentives due to a large buildup

in stocks and the 1968 agreement was not renewed. However, increased yields due to improved cultural techniques have again resulted in large supplies for export and efforts are being renewed to negotiate export limitations. Similar efforts are being made with the Republic of Korea which has sharply increased exports of canned mushrooms to the United States in recent years.

#### Restraints on coffee

The International Coffee Agreement of 1968 and the preceding agreement of 1962, were designed to stabilize the price of coffee at approximately the 1962 levels through an export quota system administered by the International Coffee Organization (ICO). Over the long term, producer members are expected to adjust production to amounts needed for domestic consumption, exports, and carryover in magnitudes which will maintain coffee prices at a relatively stable level, but high enough to provide adequate foreign exchange earnings for the producing countries. Most producing countries depend in great part on the sale of coffee for the foreign exchange needed to pay for their imports and to meet foreign debt obligations. Producing countries are expected to abide by the export quotas allotted by the ICO, and, if persistently in violation, may be required to withdraw from the agreement.

Importing countries adhering to the agreement (including the United States, which consumes about 40 percent of the coffee sold in the world) are obliged to require a certificate of origin (validated by ICO export stamps) for all coffee imported from member countries and to forward such certificates to the International Coffee Organization. By this procedure, the ICO determines whether or not the member

producing countries are adhering to stipulated export quotas. 1/ The importing countries, including the United States, also control imports of coffee from nonmember countries at a level "not in excess of its average annual imports of coffee from those countries during the calendar years 1960, 1961, and 1962" (see section on Quantitative Restrictions and Licensing Arrangements).

In a recent resolution passed by a majority of members of ICO (over the objections of producing countries) the agreement was extended for two years beyond September 1973 but without the machinery to control the amount of coffee released to the world market and establish price ranges within which it is bought and sold.

#### Restraints on cocoa

The International Cocoa Agreement, which became effective October 1, 1973, is designed to stabilize the world cocoa market by assigning annual export quotas, as follows: 2/

	<u>1,000 metric tons</u>
Ghana	580.9
Nigeria	307.8
Ivory Coast	224.0
Brazil	200.6
Cameroon	126.0
Togo	28.0

---

1/ The ICO failed to establish export quotas for the period from December 11, 1972 through September 30, 1973. This was the first time in the history of the agreement that export quotas were totally absent; however, the United States continued to control imports from countries which are not members of the ICO.

2/ Quotas were also assigned to the Dominican Republic, Equatorial Guinea, and Mexico, but these countries did not sign the agreement. Several countries with annual production of less than 10,000 metric tons are exempt from export restrictions; also certain producers of fine or flavor cocoa are exempt.

These basic allocations have been established according to each country's highest production since the 1964-65 crop year. Quotas will be regulated according to certain pricing mechanisms. Effective quotas range upwards from 90 percent to 105 percent of the established quota as prices increase from 23 cents per pound to 29 cents; when prices exceed 29 cents, the export quotas are suspended. When prices reach 31 cents and above, sales are made from established buffer stocks which have been purchased with funds collected from export levies. Importing signatories are required to place certain limitations on imports from nonparticipating nations. Although the United States is not a signatory to the Agreement, it plans to cooperate by furnishing statistics on trade and prices.

#### Restraints on footwear

In June 1973, the Government of the Republic of Korea began controlling its exports of certain rubber and plastic footwear to the United States. Exports of footwear with rubber soles and fabric uppers will be limited to an increase of 20 percent in 1973 (over 1972), 17 percent in 1974, and 13 percent in 1975. Exports of high-top protective footwear with soles and uppers of rubber or plastic will be limited to an annual increase of 20 percent in 1973, 1974, and 1975.

#### Other export controls

Historically, governments have imposed quantitative limitations on their own exports principally to conserve supplies of the controlled products for their own citizens or industries. Controls of this type

have also sometimes been used to compel development of more advanced industry in a country, or to prevent foreign demand from raising the prices of raw materials used by local industry. From time to time, however, exports have been controlled for military or strategic reasons.

The United States has employed major restrictions on its export trade with the Communist countries for over twenty years. The Export Control Regulations state that these controls have three purposes: The preservation of the domestic economy from a drain of scarce materials, the protection of national security and the furthering of U.S. foreign policy. An outgrowth of the Cold War, export limitations have existed in order to prohibit, if possible, the Communist nations from acquiring materials and technologies which could strengthen them in such a way as to be damaging to U.S. national security.

The present U.S. export controls began in 1948 with measures to restrict the exportation of most articles intended for the East European trade. These goods were placed under mandatory license. The Export Control Act of 1949 established an export trade policy with Communist nations which was subsequently extended in force until 1969. The 1949 act, which expanded the previous control efforts, was followed in 1951 by the Mutual Defense Assistance Control Act (the Battle Act) under which the U.S. embargoed all exports to the U.S.S.R. and its satellites of arms, ammunition, atomic energy materials, petroleum, implements of war, transportation materials considered to be strategic, and goods used in the production of all these items.

The Export Control Act provided the President with nearly total discretionary authority to place restrictions on exports from the United States (except the power to impose taxes on exports which is unconstitutional). All exports are under mandatory license except most of those destined for Canada. Two types of licenses are involved. A general license is a broad authorization allowing exportation of goods which may be freely traded under certain basic conditions. No application is required and a license document is not issued. A validated license authorizes a particular shipment within specific limitations detailed in this formal document. Since 1949, the number of items once requiring validated licenses which have been transferred to the general license category has been substantial. 1/

Under the Export Control Act, all nations, except Canada, have been divided into several groups by the desired level of export restriction. The degree of restriction is dependent on administrative judgments of the likelihood and extent of danger to American security resulting from export of the product in question. An embargo was imposed on U.S. exports to North Korea, North Vietnam, Cuba and, until 1972, China. Export controls for China and the U.S.S.R. remain generally greater than those for the nations of Eastern Europe. There are also differences in the treatment which individual East European countries receive. Yugoslavia is dealt with much like a Western country; exports to Romania and Poland, while still being restricted, are less limited than exports to the rest of the Warsaw Pact countries.

Those who violate the export control regulations in the United States are subject to fine, imprisonment, seizure of goods and denial

---

1/ In 1971, over 375 commodities were decontrolled to the U.S.S.R. and other East European countries, thus raising to 1,700 the number of commodities which, at that time, had been decontrolled since 1969.

of export privileges. If abroad, they are denied U.S. exports under license. In 1971, fines against violating individuals and firms totaled \$42,900 and 188 shipments valued at \$394,160 were seized.

The United States and the other NATO nations (less Iceland, plus Japan) established the Coordinating Committee on Export Controls (COCOM) in 1950. The purpose of this organization was to multilaterally control trade with the East in "strategic" items. There are 600 items on the COCOM restricted list; the United States' list contains about 1,000 additional items. Since the other COCOM countries have no export limitations to Communist countries beyond those items specifically on the COCOM list, the U.S. restrictions usually do not prevent Communist nations from procuring items on the U.S. list (except in those situations where the United States has a monopoly). American efforts to influence other Western nations to follow its example on standards of control have failed. In fact, American drives for more stringent controls have sometimes caused strain in relations between the United States and its COCOM allies. In addition, the COCOM group has been growing less and less restrictive as changes have occurred in political relations with the Communist nations. This same situation has occurred in the China Committee (CHINCOM), a multilateral group instituting controls on exports to China. In this association too, there has been a gradual erosion of support for controls.

Moves to liberalize U.S. export controls achieved notable results in 1969. Though similar in structure and methods to the 1949 act, the Export Administration Act of 1969 began to relax U.S. restrictions and such items as disinfectants, cement, vaccine, yellow corn and fabrics were freed from rigid limitations. During 1969-72 a series of moves

took place to liberalize trade with China, culminating in February 1972, when the list of restricted items for China was made the same as that for the Soviet Union.

Following the trend of relaxation of export controls, again in February of 1972 the President removed restrictions imposed on exports of foreign subsidiaries of American companies, within certain general conditions. These subsidiaries are freed from licensing control if the goods involved are totally of foreign manufacture, contain no U.S. materials and are not based on restricted U.S. technology. As a result of this action, U.S. subsidiaries abroad now are placed on the same basis as foreign companies, subject to the law and policy of the nation in which they operate.

Amendments to the Export Administration Act of 1969 were passed in August 1972. Recognizing that export trade is being lost to U.S. allies who interpret the term "strategic" more leniently, these amendments call for the American export control policy to be examined and evaluated in the light of the current political and economic situation. The Secretary of Commerce is ordered to undertake an investigation which will indicate those items (including technical data) no longer requiring export control. Many of the restricted articles and much of the limited technical information is already available without restriction from sources outside the United States. The provision is made, however, that those controls which do protect national security and foreign policy shall remain.

While there has been a definite relaxation of export controls for national security reasons under the provisions of the Export Administration Act, other controls have recently been implemented

pursuant to this authority to prevent a drain of scarce agricultural products. "Short supply" controls are used only when they are necessary to protect the domestic economy from the excessive drain of scarce materials and to reduce the inflationary impact of abnormal foreign demand. During the summer of 1973, the Department of Commerce determined that the United States faced a possible shortage of major foodgrains, feedgrains, and soybeans. Consequently, an export licensing system was inaugurated under which export quotas could be established for soybeans, cottonseed and certain of their products and certain additional categories of farm commodities which are competitive with soybeans and cottonseed, including livestock protein feed, edible oil and animal fats. After further analysis of the supply-demand situation, these restrictions were liberalized for contracts entered into on or after September 8 and all restrictions were terminated as of October 1. Since then, concern over the supply-demand situation for certain fertilizers has led to the establishment of a monitoring system with respect to production, inventories, shipments (foreign and domestic), and foreign orders for fertilizers and related chemicals.

These and other shortages which have developed in the United States during the period of price/supply distortions in 1973 have resulted in various repercussions in other countries. For example, in June Canada placed gasoline, heating oil, and protein feedstuffs under export control and in August placed beef and pork under control to prevent a drain on Canadian supplies. During this same period the European Community introduced export levies for corn and barley and stopped the issuance of export certificates for durum wheat.

Argentina and Brazil also reportedly applied export controls on feed-grains and protein meals. More recently, Canada has imposed an export embargo on steel scrap.

Also in the summer of 1973, the United States instituted a contract licensing system for export of ferrous scrap. <sup>1/</sup> This system was superseded in 1974 by export quotas on a country basis. The overall quota for the first quarter of 1974 was established at 2.1 million short tons, allocated by countries of destination, as follows:

	<u>Short tons</u>
Argentina	34,800
Canada	200,300
European Community	197,400
Greece	22,800
Japan	823,300
Korean Republic	123,700
Mexico	165,000
Spain	182,000
Taiwan	100,700
Thailand	14,800
Turkey	27,600
Venezuela	50,000
All other countries	
(including contingencies)	<u>157,600</u>
Total	2,100,000

Allocation of the quota among exporters will be based on monthly performance during the period from July 1, 1970, to June 30, 1973.

United States producers and exporters submitted several complaints to the Tariff Commission against U.S. export controls, charging that the controls had simply resulted in loss of valuable business without producing the intended benefits to national security.

---

<sup>1/</sup> The term "ferrous scrap" includes various types of heavy melting steel scrap; certain iron or steel borings, shovelings and turnings; shredded steel scrap; certain tin-plate and terne plate; iron scrap; and rerolling material; for purposes of the export control system of the United States, it does not include stainless steel scrap.

## Exchange Controls and Other Monetary and Financial Barriers to Trade

As goods and services and financial capital move across national borders, payments in some form of acceptable currency or medium move in the opposite direction. The term "financial barriers to trade" is used here to refer to restrictions on the payments and/or financial cycle of a trade flow. Restrictions on the financial side slow the flow of real goods and services by raising the costs of trade in a manner similar to tariffs and other nontariff barriers. Common examples of such financial barriers are foreign exchange controls and other regulations on the method and time of payment for imports. Financial barriers to trade are found principally in the developing countries, which have experienced severe shortages of foreign exchange for many years, but such obstacles are also encountered in the industrialized nations.

Financial barriers are often embedded in the exchange rate system. Here manipulations of the exchange rate for trade balance purposes are encountered. Even though they generally are accepted as complying with the rules set up by the International Monetary Fund, the numerous variations of exchange rate systems used especially in developing countries for balance of payments purposes are cited by exporters of other countries as financial barriers to trade.

Many developing countries have, or have had, systems of multiple exchange rates. This is actually a form of protection, since goods which can be imported, for example, at 20 pesos per dollar are going

to be preferred over those that must be imported at 40 pesos per dollar. An example of the potential trade barrier effects of a multiple exchange rate system is given for Brazil for 1956 in table 8-W. In Brazil, available foreign exchange was allotted in certain proportions to five categories of goods and was auctioned off to the highest bidders in each category. <sup>1/</sup> This system resulted in differing average exchange rates for each category which were converted to protection percentages.

Table 8-W.--Brazilian import exchange rates in 1956 and resulting protection percentages <sup>1/</sup>

Import category	Average exchange rate (cruzeiros per dollar)	Resulting protection (percent)
1. Inputs to agriculture; certain pharmaceuticals and inputs to the pharmaceutical industry; and some other "essential" commodities-----	74	4
2. "Essential" raw materials (i.e., those for favored industries, almost all producers of intermediate goods)-----	81	14
3. Other raw materials and "essential" spare parts and equipment (those for favored industries)-----	103	45
4. Other spare parts and equipment, and fresh fruits-----	116	62
5. All other commodities (i.e., most finished consumer goods)-----	222	210

<sup>1/</sup> "Protection" is the percent by which the rate exceeds the free trade rate estimated in the Brazil study.

Source: Bela Belassa and Associates, The Structure of Protection in Developing Countries, Johns Hopkins Press, Baltimore, 1971.

<sup>1/</sup> In 1957, the number of import categories was reduced to two--"general" and "special." Auctioning of foreign exchange for products in the general category was discontinued in 1961, and by 1967, all products in the special category had shifted to the "general" category, and a free market was allowed to function.

The table shows that for Brazil the average exchange rates resulting from the foreign exchange rationing scheme provided an enormous amount of protection. Other countries have had schemes of set multiple exchange rates, but the Brazilian case in 1956 was especially interesting because the multiple exchange rates were a direct result of foreign exchange rationing. However, the protective effect was as if the multiple exchange rates had been fixed, or the equivalent tariff had been imposed. As is true with many other financial barriers to trade, this scheme on the foreign exchange basis was tied to licensing. Usually foreign exchange is granted at the set rate only when an import license has been obtained.

Another common type of financial barrier (used especially by developing countries) is the prior import deposit. This typical barrier used to restrain imports is discussed in the section of this report dealing with nontariff charges on imports.

There have been numerous complaints against the payments system used in Japan. Prior to the recent changes in the import licensing system, foreign exchange obtained through authorized banks could be remitted abroad by holders (or third persons) of automatic approved (AA) licenses or automatic import quota (AIQ) licenses. Importers under the import quota (IQ) system had to apply to the Ministry of Trade and Industry for import quota certificates. Banks issued import licenses to quota certificate holders and the foreign exchange

could be remitted abroad only by an import license holder. This "financial barrier" in the form of an exchange restriction was only a method of enforcing the quota system. These methods appear to be hangovers from the days when Japan had a deficit balance of payments. Her transition to a surplus country has outpaced her dismantling of some of the financial trade barriers typically used by chronic deficit countries.

Some argue that the "standard method of settlement" for imports to Japan constitutes a financial barrier to trade. This method requires that imports be paid for within four months of the receipt of the bill of lading. A "non-standard method," which allows a longer time to pay for the imports, requires permission from the Ministry of Trade and Industry. This permission is needed by the foreign exchange banks before they can settle payments by a nonstandard method. Standard methods of settlement, on the other hand, can be automatically handled by the foreign exchange banks. The argument against the standard method of settlement on the import side is sometimes based on the fact that while four months are allowed for a standard settlement of import payments, six months are allowed for export payments to be settled. Some feel this is unfair since it in effect allows a longer credit period for exports than imports. This argument is somewhat offset

by the fact that the export credit period is calculated from the date of export license issuance which is usually three or four weeks prior to shipment. The import credit period, on the other hand, is counted from the time of the receipt of the bill of lading indicating that the goods have already arrived. Thus, the actual time difference for credit possibilities between exports and imports is less than a month.

In the United Kingdom foreign exchange remittances may be sent on evidence that goods have been or are about to be dispatched. Except for the few goods subject to control by licensing, there were no significant financial barriers to imports into the United Kingdom at the end of 1970. However, the United Kingdom is an excellent example of a country that used many financial barriers to trade around the time of the devaluation of the pound in 1967. In 1966 the United Kingdom restricted the amount of foreign exchange allowed for travel out of the sterling area (£ 50 per year for tourism). This was raised to £ 300 per trip in 1970, after the sterling crisis was well past. Several other types of currency restrictions which kept foreign exchange from going out of the sterling area served, among other things, as a barrier to keep United Kingdom tourists from going abroad. The United Kingdom case was clearly one where financial barriers to trade were used prior to and following devaluation as supplementary curative measures for Britain's payments deficit.

Financial barriers are perhaps more complex than other NTB's to analyze because: (a) they are often tied to the use of other NTB's, so that pinpointing the real restriction is often quite difficult; (b) they are sometimes allowed for balance of payments purposes by the International Monetary Fund (IMF) and the General Agreement on Tariffs and Trade (GATT); (c) they are more easily applied and withdrawn than many other trade barriers and their "valve like" nature makes their use widespread for balance of payments purposes, both in developed and developing countries; and (d) some are an integral part of the general protection system and domestic economic policies of certain countries, thus making their isolated study difficult. All of these factors point to a need for placing financial barriers to trade in their general economic context if their intent and operation is to be understood.

A domestic economy produces a set of goods and services for sale domestically and abroad. Domestic income is derived from the production of these goods and services. An exchange rate (or rates) translates domestic prices to foreign prices and visa-versa. Import tariffs, nontariff barriers, and subsidies to exports or imports can serve to change relative domestic and foreign prices, i.e., create a larger differential between them than would otherwise exist. Producers, domestic and foreign, look at the price structure they face (accounting for both the prices of the potential goods produced and

the costs of needed inputs to production) and decide what they can most profitably produce. In some cases subsidies to producers will allow them to produce goods (for domestic consumption or for export) which the price structure would normally indicate to be unprofitable.

Domestic consumers taking into account their income, and domestic producers taking into account their input costs, both note the relative prices of domestic and foreign goods and services (as they are influenced by the exchange rate and protection system) and their preferences in deciding what combination of domestic and foreign goods to purchase. The combination of domestic consumers' purchasing decisions and domestic producers' input purchase decisions, given the price structures and prevailing preferences, determine imports of goods and services into the domestic economy. Foreign consumers and producers make the same choices thus determining their imports and therefore exports of other countries.

Given domestic protection systems and their resulting domestic price structures, prevailing exchange rates, and the resulting collective choices of domestic and foreign purchasers, a trade balance results between the domestic economy and all foreign economies. The trade balance plus some other items such as capital flows combine to make up a current payments balance between a country and foreign nations.

If a country has a significant payments deficit for a long period of time, something must be done about it. A persistent deficit means that a country will deplete its reserves of foreign exchange or acceptable means of international payment for its foreign purchases. Some things can be done to improve the part of the payments balance due to nontrade items such as capital flows, but for the major trading countries, trade in goods and services is usually a large share of the current payments flow. For the United States, for example, the bulk of recorded current receipts are for U.S. exports and an increasing proportion of U.S. recorded payments to foreign countries are for imports. <sup>1/</sup> Thus, if a country has a persistent balance of payments deficit (depending upon the prevalent international trade and finance system in effect), various natural events will occur or policy decisions will be taken to correct the trade balance.

A complex mathematical model would be needed to specify all of the linkages and economic interplays relevant to a rational adjustment of a trade imbalance. Theoretically, a trade balance can be improved by: (a) restricting imports by some sort of tariff, financial, or other nontariff barrier, (b) promoting exports by subsidies of a direct or financial nature, (c) using the exchange rate system to influence the trade balance, i.e., multiple exchange rates or a devaluation may alter the ratio of domestic

---

<sup>1/</sup> For the United States, in 1968 the ratio of exports to receipts was 82.4 percent and the ratio of imports to payments was 54.5 percent.

to foreign prices so as to encourage exports and discourage imports, or (d) using all of the above measures. All of these measures may include actions classified as financial because of their placement in the finance/payments side of a trade flow.

All talk about barriers to trade, payments deficits, etc., is based on some notion of an equilibrium state where these problems do not exist. The empirical problem in measurement of these barriers and deficits is to estimate what that equilibrium state would be in the absence of barriers and deficits. An equilibrium state in the trade-payments system may imply a set of parameters needed to maintain that state. If parts of the system such as trade barriers are changed, other parts may also have to change in order to maintain a payments balance under the new system. A common kind of statement reflecting this line of thinking is that a lowering of protection barriers by one country, unless matched by other countries, may require a devaluation of its currency to maintain a balance in its international payments.

Another example of the problem of determining a hypothetical equilibrium is found in the necessity of often postulating normal rates of return to factors of production when measuring the subsidy element of measures such as tax incentives to exporters. Measures of such subsidies are very dependent on what the normal rate of return might be. This rate of return, in turn, is partially dependent on the stage of the business cycle the economy is in, the state of demand for the product, and possibly many other factors.

Thus, many parameters which might be desired in an equilibrium state for comparison purposes may not be easily discernible in a dynamic world economy, especially if the desired parameters are not independent of the things to be measured.

Another problem particularly acute for analysis of financial barriers, but also relevant for many others, is the duration and cause of a particular economic problem for which a trade barrier is a temporary solution. For example, if a country runs a persistent payments deficit, it may be forced to do one of the following: (a) suspend payments (because it has run out of foreign exchange or acceptable international reserves); (b) resort to measures (some of which may be of a financial trade barrier nature) which will correct the payments deficit; or, (c) ration the remaining foreign exchange. The inability to pay for imports as well as the existence of financial or other barriers to slow down imports would constitute a trade barrier from the point of view of exporting countries. This situational context makes financial barriers or barriers associated with balance of payments problems a little more complex than other NTB's. The blame might be put on the financial barrier, or the economic policies and events which led to the payments problems. The deficit might be temporary due to the loss of an export crop because of a dry season or it might be due to cumulative errors in domestic and foreign economic policy of the deficit country.

Such conditions had to be considered in setting up some of the institutional arrangements for international trade and payments under which the present financial barriers to trade often occur.

Finally, the costs of protection through financial as well as other barriers to trade should be considered. In efficiency terms, protection means that resources are kept in relatively inefficient industries (in terms of world prices) and therefore out of relatively more efficient industries where the same factors could earn more real income. A unit of resources in an inefficient, protected industry saves much less in foreign exchange loss (due to foregone imports) than the same unit would earn if it were used instead in a more efficient export industry. Thus the balance of payments argument for protection to cure a payments deficit, except for emergency use, may be basically self-defeating. The institutional arrangement for dealing with payments imbalance had to lie between two theoretical possibilities. The first possibility would be to simply allow freely fluctuating exchange rates between countries. A deficit country would, as its reserves ran low, find its currency depreciating. This would tend to make its imports more expensive in domestic prices and would lower the foreign currency price of its exports; the price effects thus would work to improve the trade balance. Such a system might have the merit of restricting the international effects of incorrect domestic economic policies. The chief objection to the flexible rate system is the possible instability of

exchange rates. If much uncertainty was involved, the insurance costs against this uncertainty for traders would itself be a barrier to trade. Furthermore, some kinds of trade might be hurt more than others, i.e., trade in items which had a long period from order to delivery (such as jet planes, turbines, ships, etc.) might have higher exchange risk costs than items which would be ordered and delivered in a month. Finally, bad experiences during the depression of the thirties where countries devalued competitively in order to create export markets for employment purposes, left many people wary of schemes for too flexible exchange rates.

The other possibility would be fixed exchange rates with some sort of institutional way of allowing for temporary trade restrictions to correct payments imbalances and for changes in exchange rates when they were deemed necessary. Problems with this system have been made clear over the past few years where immense pressures were allowed to build up before exchange rates that needed adjusting were actually changed. This system, therefore, also has had its uncertainties and has led to the "temporary" use of many so-called financial barriers to trade as a substitute for, a delaying tactic until, or an accompanying program with eventual exchange rate changes that have been too slow in coming. The fixed rate type of system also has the defect that very little pressure for adjustment is put on surplus countries. A perfectly flexible system would appreciate the currencies of large surplus countries, thus tending to put downward pressures on the payments surpluses.

Thus all of the above arguments and reasonings have led to the present world monetary and payments systems in which financial barriers to trade often play a part in serious payments deficit situations. There are cases where financial barriers in existence today are not needed for balance of payments purposes. In some cases these barriers are left over from the days when the particular country was a deficit country and used the barriers as an additional tool to correct payments deficits. This again would be a case where, as a country moved from a deficit to a surplus position, too little accompanying pressure was maintained to cause removal of the trade restrictions used to correct the deficit.

The International Monetary Fund was set up in 1944 to maintain a system of fixed rates which could be changed only when something called "fundamental disequilibrium" occurred in a country's payments situation. The basic goal was to have a set of "par values" of currencies. Member countries would be obliged to maintain their individual currencies within plus or minus one percent of these par values and to avoid restrictions on payments for current international transactions. Currencies were to be "convertible," i.e., they were to be exchangeable for one another at their par values for purposes of making international payments settlements. The IMF also has an allowance in the Articles of Agreement for cases where convertibility could not be maintained. Article VIII of the Agreement of the International Monetary Fund roughly provides that

members should maintain convertible currencies and no payment restrictions while Article XIV provides for a period of transition in which exchange restrictions (and therefore no convertibility) are allowed while a country tries to undertake policies to correct its deficit situation. The Fund classifies a country as having either Article VIII or Article XIV status. In the latter case, the fund can exert pressure on a country to exert corrective policies and in return it allows restrictions on current payments, some of which are classified as common financial barriers to trade.

In addition to the IMF, the General Agreement on Tariffs and Trade allows restrictions on trade payments for balance of payments reasons when international monetary reserves become seriously low. Thus under the system of fairly fixed exchange rates, the international institutions allow some "temporary" financial barriers to trade for balance of payments purposes. The ideal goal to be promoted by these institutions is relatively free trade and unhindered payments for that trade. However, when countries have experienced severe payments difficulties, the escape provisions have been applied and payments restrictions allowed. Especially in the cases of developing countries, the granting of balance of payments restrictions has been accompanied by pressure from the organizations for either deficit corrective policies and/or exchange rate changes. While countries maintaining financial barriers but not experiencing payments problems are violating the GATT and IMF rules, the removal of

payments restrictions (like other trade restrictions) is sometimes slow for countries that move from deficit to surplus positions.

#### Financial barriers in selected countries

Table 8-X summarizes the IMF status and some financial barriers to trade for selected countries which are the largest customers for U.S. exports. As indicated in the table, it has largely been the developing countries which have been granted Article XIV status and which have thus imposed most of the exchange and payments restrictions. The following pages briefly discuss the various practices shown in the table. Some are only informational, i.e., not normally considered to be a trade barrier under the rules. For example, a country either is classified as having a convertible currency and no serious restrictions on payments or it is classified as having Article XIV status where restrictions are allowed for payments purposes. Article XIV status implies that the country together with IMF help is doing something to put its house in order. The approval of restrictions by the IMF has no other significance, since if the restrictions were not applied, the country would completely deplete its reserves and be unable to make payments for its trade anyway.

One can also note other linkages and nonlinkages among the item headings. Many of the barriers, such as multiple exchange rates, payments restrictions and import and export restrictions, come about when Article XIV status is granted. However, many restrictions on capital transactions occur even when the Fund indicates that a

1/ An "X" indicates the IMF's judgement of a country's status in 1970 with respect to the particular row item. Article VIII status loosely means that a country's payments are not restricted for current international transactions while Article XIV status indicates IMF acknowledgement of a "fundamental disequilibrium" in the payments balance and IMF allowance of exchange restrictions. Other items in the table not self explanatory are briefly discussed in the text.

2/ Switzerland is not a member of the International Monetary Fund. Data are shown for Switzerland to indicate what would apply if Switzerland were a member.

Source: Annual Report on Exchange Restrictions, International Monetary Fund; except share of U.S. exports is derived from OECD trade statistics.

country is not restricting current payments in general. A sign of slippage in the fixed rate system is that there are some countries such as Canada or others (when in foreign exchange crises) who have occasionally floated their rates, thus not maintaining the par rates as the IMF would like.

Article VIII status.--Loosely, Article VIII requires that a country can not restrict payments for current international transactions without IMF approval. It also requires convertibility of currencies, i.e., that a country must be willing to buy back balances of its currency held by other countries making payment in gold or other convertible currencies. In August 1971, the United States closed the gold window, meaning that it would not buy back dollars held by foreigners making payment in gold, i.e., the dollar now is not convertible and the United States does not presently meet Article VIII status.

Article XIV status.--Article XIV status allows a transitional period of adjustment during a period of "fundamental disequilibrium" for a country when the IMF will allow the operation of some exchange restrictions. Usually, if the IMF grants this status, it obliges a country to cooperate in a program to improve the trade balance, change the exchange rate, or correct whatever led to the foreign exchange shortage that triggered the need for restrictions.

Article XIV status is the antithesis to Article VIII status, i.e., a country will be granted either one or the other by the IMF.

Agreed par value.--Members of the IMF are expected to have a par value for their currency in terms of gold which is agreed on between them and the IMF. This row indicates whether or not such an agreed par value exists.

Par value applied.--This row indicates whether or not the agreed par value is actually applied. Normally countries are obliged to intervene in foreign exchange markets to maintain their exchange rates within plus or minus one percent of the agreed par value. However, some countries which have Article VIII status don't maintain a par value and have other exchange arrangements such as multiple rates. Some countries such as Canada, which do have a par value, allow their rate to fluctuate freely outside the limits encouraged by the IMF,

Unitary effective rate.--The unitary rate alternatives offered to par values are fixed rates, freely fluctuating rates, and pegged rates. Usually the allowance of the Fund for nonexistent par values is linked with Article XIV status. Temporary floats of currencies, however, have been used by Canada in the past and by other countries more frequently in conjunction with recent world monetary crises. Such floats are practically overlooked by the IMF as temporary measures.

Special rate arrangements.--Certain other exchange rate arrangements are allowed by the Fund only in "transitional" periods under Article XIV status. These are foreign exchange restrictions that would be definitely classified as financial barriers to trade, but under certain balance of payments difficulties, are accepted as being necessary by the IMF. One such arrangement is where a country

has a separate or special rate operating for capital transactions or invisibles on trade account (such as tourism). Another is where the import rate is different from the export exchange rate and another case is where multiple import and export exchange rates exist. All of these arrangements represent forms of multiple exchange rates that are used ostensibly for balance of payments purposes. Some countries have used special rates on capital transactions to regulate short term capital movements which can cause havoc in foreign exchange markets. Such restrictions can be given Fund approval and can even be requested by the Fund.

In the case of foreign exchange restrictions for regulating capital flows, the IMF's charter is ambiguous. However, IMF practice and the fact of the linkage of capital flows and trade flows in the foreign exchange markets under a system of convertible currencies have led the Fund into this area of exchange regulation as well.

The table also indicates whether or not payments restrictions exist on current transactions and on capital transactions. Restrictions often exist on capital transactions even if Article XIV status is not granted. The types of restrictions indicated can vary tremendously. They include the items listed in the table as well as such things as limits on the amount of foreign currency people can take out of a country for travel purposes.

The objective of the IMF is to allow payments for international transactions in convertible currencies or gold on a multilateral basis.

Restrictions that prescribe specific currencies for international payments are to be avoided. However, many countries have agreements with other countries on a bilateral basis or with currency areas which prescribe certain currencies for intercountry payments. Import surcharges are often imposed at times of balance of payments crises (e.g., the United States in August 1971). Advanced import deposits also are used as an emergency balance of payments measure and are discussed in the section on charges on imports.

The table also indicates whether or not an exporter has to surrender his export proceeds. Often this must be done at an authorized bank, and the foreign exchange must be surrendered for domestic currency at the official exchange rate. The existence of such regulations provides a potential tool in foreign exchange regulations. It prevents, among other things, domestic exporters from holding foreign currency accounts at home or abroad.

The last two lines of the table show whether the country is a part of a larger monetary area (specifically, the sterling area or the French franc area) and whether a particular country belongs to some sort of a customs union such as the EC.

Table 8-Y presents a crude index of the financial barriers to trade listed for the countries in table 8-X (except the United States), a crude measure of the credit worthiness of these same countries as seen by a major New York bank, and some data on their payments balances.

2/ This number is the balance of payments for goods and services as a percentage of exports plus imports. A positive number means a surplus while a negative number means a deficit.

3/ A count of the x's for each country in table 8-X. All countries have some marks in table 8-X, but those with more restrictions have more marks.

Source: Compiled from IMF statistics, statistics of the Chase Manhattan Guide for Exporters, and from data in table 8-X.

The listed countries accounted for two-thirds of world exports in 1971; the table shows the share of world exports accounted for by the countries. These numbers are particularly useful in looking at various countries' export promotion (financial) schemes because the potential worth price effects of such schemes are greater in the larger exporting countries.

Index of relative collection experiences for the quarters of 4/68-4/70.--An index was prepared for each country by using the collection record for sight and time drafts published in the Chase Manhattan Guide for Exporters. The percentage of sight drafts for which payment was received within four weeks of the dispatch was calculated. The index was the ratio of the percent collected in four weeks to the import weighted percentage. A higher than average index number (higher than 100) indicates prompt collection of dollars for U.S. exports by Chase Manhattan while a lower than average index indicates a slower payment of dollars that could be associated with a country's balance of payments and foreign exchange restrictions and her resulting financial barriers to trade.

Variability of collection experience index.--This is an attempt to measure the variability of the index numbers used over the nine quarters from 4/68 to 4/70. The number represents the standard deviation divided by the mean for the index numbers for a country over the nine quarter period. A high number indicates that the collection records tended to vary quite a bit over the period.

This probably indicates precarious balance of payments situations and foreign exchange positions. A lower number indicates that the relative indices of collection remained fairly constant over the period.

Balance of payments for goods and services.---These figures present a rough indicator of the average balance of payments for goods and services over the 1968-1970 period. The balance of payments for goods and services was divided by the total exports plus imports in order to make the relative balance of payments figure comparable on a cross-country basis. A positive number means a surplus while a negative one means a deficit.

Indicator of financial barriers.---These figures represent an effort to give a very crude indication of financial barriers to trade that were in effect during 1970. The numbers are simply the sum of all of the checks for each country in table 8-X. Thus, they only add up the number of barriers; the magnitudes of the barriers themselves are not measured. However, they do give a crude indication of the relative numbers of financial barriers that countries have had in effect for whatever reason.

Chart 8-A presents a graph of the index of collection experience versus the variability of the index for the period January 1968-April 1970. The left vertical axis roughly indicates how prompt the various countries were (relative to the average promptness) in returning dollars to Chase Manhattan Bank when the bank sent the

Source: Plotted from table 8-Y, as noted.

sight drafts to the countries for payment. A higher index means prompter payment of dollars while a lower index means slower payment on the average over the 1968-1970 period. The horizontal axis indicates the variability in payment periods for countries. A large number indicates that the collection period for that country varied considerably over the nine quarters covered while a lower number indicates a relatively fixed average collection time. The correlation coefficient between the index of collection records and the variability of the index is  $-0.79$  indicating, as the figure shows, that these two items are quite strongly linked. The general picture is that the developed countries, who are our major trading partners, tend to pay their bills promptly and are fairly consistent in their promptness. These are the countries whose points are in the upper left part of the graph. The less developed countries, on the other hand, are the ones whose payments of dollars are often delayed and whose collection record varied considerably over the nine-quarter periods observed. Thus, the figure gives a crude picture of the international credit rating of certain specified countries. The countries down and toward the right on the graph are the ones which generally experience foreign exchange shortages and therefore are not always prompt in delivering dollars. They will be the ones most tempted to use financial barriers to trade for the expressed purpose of improving their poor foreign exchange situation.

Chart 8-B indicates the reason for the collection experience pattern for these countries by plotting the collection index on the vertical axis versus the measure of the net balance of payments for goods and services. There appears to be an association between the collection experience index and the payments balance. Countries tending towards a payments surplus over the 1968-1970 period paid their dollars to U.S. banks more promptly than those which were experiencing trade deficits over that period, thereby confirming the link of trade deficits to foreign exchange shortages and slow payment of dollars for U.S. exports. A foreign exchange shortage by a potential U.S. customer is a barrier to trade in reality because it forces the use of "financial barriers" to trade to ration what foreign exchange is available.

Any judgments about whether countries are overly slow in delivering dollars can only be made after a thorough study of the countries' financial situations. Other pertinent parts of the payments balances have to be checked (including capital flows). Assuming that the regression line is a crude indicator of the relation between collection experience and payments balances, then Brazil, Venezuela, and to a lesser extent, Japan, seem to deviate from the average relationship most in the negative direction. That is, their payments records should have been somewhat better given their relative payments deficit or surplus. This could be a weak indication that

Chart 8-B. -- Graph of the collection record versus the balance of payments for selected countries 1/

3/ The regression coefficient.

financial restrictions on the outpayment of dollars to the United States might have been stronger than needed for these three countries given their general financial situation.

The correlation matrix in table 8-Y indicates the expected relationships between the crude index of financial barriers and the credit and payments balance measures. A rank correlation coefficient of  $-0.69$  between the financial barriers and the credit index strongly indicates that countries with more financial barriers are slow in payment of dollars to foreign exporters. A weak but significant coefficient of  $-0.39$  between the financial barriers index and the payments measure points to a tie between the countries with more financial barriers and those with payments deficits. These results illustrate our point of linkage between balance of payments difficulties, poor international credit ratings, and financial barriers to trade.

## Restrictive Business Practices

The Havana Charter defines restrictive business practices as practices engaged in, or made effective by one or more private or public commercial enterprises, or by any combination, agreement or other arrangement between such enterprises, that restrain competition, limit access to markets or foster monopolistic control. 1/

Restrictive business practices may restrain competition and trade within national boundaries only, or on an international scale. If "such commercial enterprises, individually or collectively, possess effective control of trade among a number of countries" 2/ then the restrictive practices involved constitute barriers to trade.

Restrictive business practices represent a thus far little known field of international trade restrictions. In contrast to various governmental measures and practices that impair international trade, private restrictive action is rarely even mentioned in discussions on nontariff barriers. While many countries have national antitrust legislation controlling private practices that impair domestic competition and trade, the effects of such practices on international competition and trade are still in the stage of initial exploration. Attention is only beginning to focus on the problem that, while governments are dismantling international trade barriers erected by themselves, private organizations have created such barriers of their own.

International cooperation in examining restrictive business practices has taken place predominantly in the framework of the United

---

1/ Havana Charter, Article 46.

2/ Ibid.

Nations, the OECD, the GATT, and the UNCTAD. In addition, the subject has been a natural matter of concern in the context of regional economic groupings such as the European Community and the European Free Trade Area. International arrangements on restrictive business practices thus far have been generally limited to an expression of principles and providing consultative machinery for settling disputes between countries; the international and regional organizations have not yet attempted to create a comprehensive system to deal with problems arising from internationally restrictive business practices. Proposals for this purpose have usually advocated that a multinationally agreed set of principles and rules be drawn up and an appropriate international machinery be established for enforcement.

In 1960, the GATT Contracting Parties adopted notification and consultation procedures for dealing with conflicts involving internationally restrictive business practices. <sup>1/</sup> The decision setting up the procedure also read, in part, as follows:

Recognizing that business practices which restrict competition in international trade may hamper the expansion of world trade and the economic development in individual countries and thereby frustrate the benefits of tariff reduction and removal of quantitative restrictions or may otherwise interfere with the objectives of the General Agreement on Tariffs and Trade,

Recognizing, further, that international co-operation is needed to deal effectively with harmful restrictive practices in international trade,

Desiring that consultations between governments on these matters should be encouraged,

---

<sup>1/</sup> GATT, Decision of the Seventeenth Session, L/1397, 5 December 1960, p. 17.

Considering, however, that in present circumstances it would not be practicable for the Contracting Parties to undertake any form of control of such practices nor to provide for investigations,

The CONTRACTING PARTIES,

Recommend that at the request of any contracting party a contracting party should enter into consultations on such practices on a bilateral or a multilateral basis as appropriate. The party addressed should accord sympathetic consideration to and should afford adequate opportunity for consultations with the requesting party, with a view to reaching mutually satisfactory conclusions, and if it agrees that such harmful effects are present it should take such measures as it deems appropriate to eliminate these effects.

The Contracting Parties recommended that if no mutually satisfactory agreement can be reached between a requesting party and the party (parties) addressed, the complaint should be referred to the Contracting Parties as a whole. It appears, however, that these procedures have not been used.

In 1967, after extensive factual research by an OECD Committee of Experts in Restrictive Business Practices, the OECD Council adopted recommendations concerning various forms of cooperation between member countries on restrictive business practices affecting international trade. <sup>1/</sup> The OECD urged communication between member countries respecting their pertinent practices and national legislation, and suggested coordinated action of two or more members against restrictive business practices insofar as practicable under national laws.

---

<sup>1/</sup> OECD, "Recommendation of the Council Concerning Cooperation between Member Countries on Restrictive Business Practices Affecting International Trade," 5 October 1967, OECD/C(67)53.

Both the Treaty of Rome establishing the European Economic Community and the Stockholm Convention establishing the European Free Trade Association contain rules concerning the operation of restrictive business practices within their respective areas of integration. Article 85 of the Rome Treaty deems "incompatible" and "prohibited" any arrangements between enterprises ". . . which are likely to affect trade between the member states and which have as their object, or result the prevention, restriction or distortion of competition within the Common Market." Article 86 prohibits ". . . action by one or more enterprises to take improper advantage of a dominant position within the Common Market or within a substantial part of it. . . ." The Commission of the European Community has been empowered to collect information, hold hearings, make recommendations for terminating violations and invoke sanctions. 1/

Article 15 of the EFTA Convention stipulates that restrictive business practices are "incompatible" with objectives of a free trade area "insofar as they frustrate the benefits expected from the removal or absence of duties and quantitative restrictions on trade between member states," whether they are the result of collusion between enterprises, or the exploitation of a monopoly position. In 1965 EFTA ministers agreed on detailed procedures to deal with possible infringements of the rule on restrictive business practices. 2/ Any firm which considered itself adversely affected by restrictive business practices

---

1/ Articles 3, 11, and 15 of Council Regulation No. 17, Official Gazette of the European Communities, No. 13, 204/62.

2/ Communique of EFTA ministers, see EFTA Bulletin, Vol. VI, No. 7 November 1965, pp. 2 and 16.

in a member country could request an investigation by its own government. Then, if so indicated, the matter would be taken up bilaterally or multilaterally by the governments involved. If the latter could not agree, the matter would be referred to the EFTA Council.

In describing or identifying internationally restrictive business practices, a distinction is generally made between (a) the collective restraint of competition by independent organizations, and (b) restrictions resulting from concentration of economic power or control in one organization. Most types of the former are commonly referred to as cartel activities. In the second group, the multinational corporation is the most likely type of industrial concentration which is in a position to engage in internationally restrictive business practices.

#### Cartels 1/

Both national and international cartel activity may impair or distort international trade. While restricted by antitrust legislation in most industrial countries, participation in cartels is more prevalent among firms of foreign countries than firms of the United States. Under European (and most other countries) antimonopoly law, restraints of trade and price restraints are not per se illegal. While U.S. law tends to consider dominance as a violation, European law makes illegal only the misuse of a dominant position. European governments, and Common Market policy, consider concentrations and anticompetitive

---

<sup>1/</sup> This discussion borrows heavily from two most recent reports of the UNCTAD: "Restrictive Business Practices," Preliminary Report by the UNCTAD Secretariat, TD/B/C.2/104, January 1971, and "Restrictive Business Practices," Report by the UNCTAD Secretariat, TD/122/Suppl. 1, January 1972.

agreements beneficial if they lead to increased productivity, economic growth, technological advance, or reduced prices. European antitrust laws, therefore, are not directed at breaking up cartels but at guiding them. Several of the European countries not only permit but encourage agreements among companies for the purpose of rationalizing production and regularizing the market. They have encouraged joint research and joint marketing, have permitted pricing agreements, and have not objected to export cartels to non-EC countries. Hence, cartels are a source of restrictive business practices frequently restricting U.S. trade.

Cartels restricting imports.--Import cartels involve agreements relating principally to imports, concluded among competing firms in one country or in several countries. Such cartels may collectively limit the total amount of specified imported goods, determine the sources of supply and/or fix the prices and terms of purchase. The known cases of import cartels in the developed market economy countries are rare, since they are either prohibited by law, or are subject to controls under the relevant restrictive business practices laws.

In the United States there are no legal import cartels. Arrangements similar to import cartels with respect to imports of tungsten and molybdenum exist in the Federal Republic of Germany. The United Kingdom approved an import cartel for imports of sulphuric acid. Japan apparently has a number of import (and export) cartels which,

acting as purchasing agents, serve, among other things, to enforce the "administrative guidance" of the Government in imports. From time to time illegal import cartels have been found to exist in various countries.

Rebate cartels discourage users of certain products to purchase from sources outside the cartel by granting their customers rebates on the purchase price. This practice restricts the imports of the goods in question. In the United States, rebate cartels are prohibited. In certain other countries, although rebate cartels may be prohibited in principle, they may be permitted subject to specific authorization. For example, in the Federal Republic of Germany, at the end of 1970, 33 rebate cartels were in operation, and similar arrangements, with regard to several products, have been found in Australia.

Holders of patents relating to a specific product area have often joined in a patent-pool, monopolizing markets and dividing them among the participants. According to the complaint of a U.S. manufacturer in the home electronics industry, European patent pools have successfully excluded U.S. products from competing in European markets by licensing only local manufacturers and refusing to license U.S. exporters. (These European patent pools had U.S. participants for a number of years until, as a result of legal action initiated by other, adversely affected U.S. companies, the pool lost American patent power.)

In an earlier case, a U.S. company was found to conspire with two European companies to prevent the imports of Japanese sewing machines into the United States. The U.S. company entered into cross-licensing

arrangements with the European companies concerning certain patents, and thus was given the right to enforce the U.S. patents of the European companies in the domestic market, excluding Japanese imports by virtue of its patent power.

Export cartels.--Export cartels are arrangements between competing firms relating to exports. The main restrictive practices of export cartels include agreements on export prices or conditions of sale, the establishment of export quotas, and the allocation of export markets. There are national and international export cartels, the latter comprising firms from more than one country. Export cartels generally are less strictly controlled by governments than cartels that restrict competition on a domestic market. <sup>1/</sup> Accordingly, export cartels would seem to be the most frequent type of national cartel activity. Some examples of national export cartels are given below.

In the United States, export cartels with a share of about 70 percent or more of total U.S. exports in a particular product in 1962 were: Sulphur Export Association, 86.1 percent; motion picture and TV films export cartels, 80 percent; Carbon Black Export, Inc., 69 percent. There are a number of other export cartels in the United States relating to exports of products such as potash, pulp, paper and paperboard. These export associations serve predominantly to facilitate uniformity in export prices and terms of sale.

---

<sup>1/</sup> The Webb-Pomerene Act, legalizing American export cartels in the United States, was enacted in 1918, primarily in an effort to promote export trade in the face of powerful cartels abroad.

In the Federal Republic of Germany, cartels are mostly found in engineering products, electrotechnical products and chemicals, and are concerned principally with price fixing arrangements, frequently supplemented by quantitative limitations. In some cases, there is an exchange of information concerning bids and, exceptionally, an allocation of export markets. U.S. exporters of a wide range of products may be affected by German export cartel activity in third country markets. Specific examples have been found in the experience of the major U.S. exporters of electrical products and organic chemicals.

In Japan, most export cartels are in textiles, secondly in chemicals and chemical products, and the rest are scattered over almost all industry groupings. The majority of their practices relates to controlling prices and quantities. Export cartels in Japan are materially encouraged by the Government. One major U.S. producer of electrical products points out that the Japanese Trade Council, a body headed by the Premier, encourages territorial allocation of markets between individual companies, urging them not to compete with each other on the same market. In the electronic field, companies are encouraged to pool their research efforts in order to develop the products most acceptable to export markets.

National export cartels exist also in other developed market economies but little information is available on them.

In addition to national export cartels, there are several international cartels affecting a sizable share of international trade in

a wide range of raw materials and manufactured products. 1/ It appears that in the post-war period a revival of cartel activity took place in Western Europe, either sanctioned, or supported by the national governments in question, and by the European Community.

#### Multinational Corporations

It is sometimes stated that national and international cartels of the 1930s and 1950s were a step in the evolution of the multinational corporations of subsequent years. Multinational corporations can be broadly defined as companies with affiliates in more than one foreign country, the operations of which satisfy certain criteria of integration and centralized control. Existing multinational enterprises are in large part controlled by U.S. parent companies, therefore, complaints against restrictive practices of such enterprises are directed in great measure against the United States. While there is indication that multinational corporations may be, on balance, favorable for world trade, 2/ in many instances they are alleged to restrain competition in international markets and have a distortive effect on international trade.

For example, the acquisition of a former competitor on the domestic market or export markets, or a joint venture therewith,

---

1/ Certain agricultural products are also subject to some form of international marketing control which, however, is more in the nature of a commodity agreement than a cartel proper.

2/ "The growth of large international corporations with multinational operations is likely to improve economic efficiency worldwide, though on occasion it will work in the direction of restraint of trade." Charles P. Kindleberger, Hearings on International Aspects of Antitrust Before the Subcommittee on Antitrust and Monopoly of the Committee of the Judiciary, United States Senate, 89th Congress, 2d Session, Part 1, p. 173, 1966.

terminates competition between them and may change the patterns of trade. Multinational companies can limit the freedom of particular affiliates in making their decisions on sales or purchases on the basis of commercial considerations alone. Parent companies are known in certain instances to restrict the exports of their foreign subsidiaries (sometimes to the home market of the parent) primarily by allocating corporation exports between them or retaining sales rights for themselves. Surveys conducted on foreign-owned companies in Australia and Canada indicated, that, in many instances, their affiliation had a decidedly unfavorable effect with regard to their exports. On the other hand, a study on foreign investment in the United Kingdom found that there was no evidence of such a problem, despite existing market-sharing agreements between the U.S. parent company and its United Kingdom subsidiaries. In fact, the study stated that U.S.-owned subsidiaries in the United Kingdom were more export-oriented than the United Kingdom manufacturing industry as a whole. 1/

Similarly, multinational corporations may require their subsidiaries to import raw materials, intermediate goods or capital goods from within the corporation's structure. It has been found, for example, that both in Canada and in Australia, foreign-owned subsidiaries are more import-oriented than domestically owned firms. On the other hand, U.S.-owned subsidiaries in the Federal Republic of Germany appear to show the same import propensity as the German industry on the whole. 1/ Such practices

---

1/ Information on this page is derived from various recent reports from the Secretariat of the United Nations Conference on Trade and Development on "Restrictive Business Practices" and interviews conducted by the Tariff Commission staff in preparation of its report on Implications of Multinational Firms for World Trade and Investment and for U.S. Trade and Labor, February 1973.

may have a distortive effect on international trade, or the domestic trade of the importing country; they may violate the legitimate interests of domestic suppliers or of suppliers of other countries.

#### Other areas of restrictive business practices

Imports and exports can be restricted not only by cartels or multinational companies, but also by single-firm concentration, if these have a dominating position as suppliers or purchasers of the commodity in question. For example, according to U.S. manufacturers of business equipment, the Nippon Telephone and Telegraph Company (N.T.T.) in Japan, a dominating purchaser, has a policy of buying equipment of Japanese manufacture only. This policy constitutes a serious impediment to U.S. exports to the Japanese market.

Moreover, licensing agreements may involve restrictive business practices; for example, a patent or trademark licensee may be prohibited, or restricted to export into countries where the licensor himself has obtained corresponding patent or trademark protection, including the home market of the latter. Licensing agreements can restrict not only the exports but also the imports of the licensee; they may require the licensee to purchase all, or specified materials, components or equipment exclusively from the licensor, or from designated suppliers.

Although restrictive business practices are by definition engaged in by businesses, some practices of governments or organizations other than businesses occasionally are considered to fall in this category

of nontariff barriers. An example of such a government practice is "flag-discrimination" in shipping. Several countries require that their imports must be carried in ships and planes flying their own flag. Such provisions may constitute a barrier to imports owing to frequently lacking shipping space, particularly in certain countries, and they also impede free competition of international transport.

The import-restricting practices of labor unions provide an example of practices engaged in by "nonbusiness organizations." Several countries accuse the labor unions in the United States of restricting imports by putting pressure on importers to cancel orders. Such pressure has taken the form of disrupting the exhibition of imported goods and threats to withdraw labor from dealers of imported goods.

## Discriminatory Bilateral Trade Agreements

Bilateral trade agreements are frequently concluded between two countries to facilitate trade between them by granting special advantages to each other, such as preferential customs treatment or financial arrangements and commitments to purchase prescribed amounts of specified commodities from the bilateral partner before purchases are made from third countries. Such agreements are often implemented by discriminatory quotas and licensing practices. However implemented, they are implicitly discriminatory against third countries and hence are considered to constitute nontariff barriers to third-country trade. 1/

In the Tariff Commission survey of trade barriers, fifty-two complaints were lodged against discriminatory bilateral agreements. About 58 percent of these complaints were against less developed countries, and the remainder equally divided between centrally planned and developed market economy countries. All complaints against developed market economy countries involved European nations and concerned arrangements chiefly with developing countries (principally former colonies) or centrally planned economies. Bilateral trade agreements of the type considered here are favored especially by countries with centrally planned economies and by developing countries in order to provide easier access to markets for their export products and/or to enable them to pay for imports with their own export products instead of scarce foreign exchange. The following few examples of discriminatory

---

1/ Another type of bilateral agreement discriminates against the trade not of third countries but of a party to the agreement. In such arrangements one bilateral partner agrees to unilateral restrictions upon its exports to the other. The quantitative restrictions may be administered as import controls by the receiving country, or the exporting country may "voluntarily" limit its exports. Such restraints upon trade are discussed in the section of this report dealing with "voluntary" export restraints and other export controls.

bilateral agreements are illustrative; they have not been chosen on the basis of importance.

Poland, a country with a centrally planned economy, maintains several discriminatory bilateral agreements not only with other countries having centrally planned economies, but also with developed market economy countries. Poland asserts, with justification, that as far as its market economy trading partners are concerned, it is their wish and not Poland's to trade bilaterally. Another centrally planned economy country, Yugoslavia, is known to discriminate against Western sources of imports in favor of other centrally planned trading partners with which it has bilateral agreements.

Among developing countries, India provides a good example of a country maintaining discriminatory bilateral agreements, especially with respect to capital goods. India concludes bilateral agreements preferably with countries that not only can supply the capital goods it badly needs, but also accept products of India's manufacturing industries in return. India claims that it must conclude such bilateral agreements to secure additional markets for new export products.

A case of bilateral trading by a developed market economy country is found in agreements made by Switzerland dealing with the importation of red wine. Such agreements frequently involved bilateral quotas.

Discriminatory selection of the source of imports

Some countries, under various arrangements, favor specific countries as sources for certain imports, thereby discriminating against other suppliers. Such arrangements are referred to as "discriminatory sourcing." Perhaps the majority of complaints against discriminatory sourcing relate to situations in which the exporting (usually developed) country imposes on an importing (usually developing) country "discriminatory sourcing" of particular commodities as a condition for financial aid, or by offering the products on extremely favorable financial terms. <sup>1/</sup> The economic assistance offered is tied to sales of products of the grantor.

When a country offers economic assistance conditioned upon purchase of its own exports, the objective is, in part, to find additional markets for such exports, all such assistance is usually interwoven with export subsidization schemes of the donor. "Tied assistance" can be said to involve nontariff barriers on two counts: Discriminatory sourcing on the part of the importer, and export subsidies by the exporter. Such arrangements distort international trade since the importer is not free to purchase the commodities solely on the basis of free commercial considerations. Recipients of tied financial assistance are charged with "discriminatory sourcing" by countries which are potential exporters of the products in question and compete for the markets of the recipients. However, it is generally recognized that the fault is not with the recipient but the donor country.

---

<sup>1/</sup> A closely related practice of growing importance is the increasing competition among the major countries to provide any purchaser of their exports financial terms more favorable than can be obtained in the regular money markets. Such concessional financing is essentially an export subsidy and is discussed in the part of this report dealing with subsidies.

The foreign economic assistance programs of all major countries formally or informally restrict procurement to their own or other specified sources.

Economic aid provided by the European Community is generally tied to procurement from sources of Community members and associate countries, although in specified cases the beneficiary is allowed to give some price preference to local suppliers. When member countries of the Community provide economic assistance as individual countries, such assistance is also frequently tied to their own exports. This is true of all EC members, although not to the same degree. However, in some arrangements and under specific conditions, the beneficiary is allowed to purchase from local suppliers or other developing countries.

Canada and Japan also tie economic assistance in various ways to procurement of their own goods and services, with some concessions to local procurement or to procurement from other developing countries. Moreover, Japan appears to practice discriminatory sourcing in an effort to diversify the sources of its farm imports. The objective is to draw from several sources rather than to depend exclusively on one or two major ones. Another objective of such diversification is to assist developing countries, particularly those in Southeast Asia, in increasing their farm production. In addition to opening its markets to them, Japan actively gives production assistance to such countries as Indonesia, Thailand, and Cambodia in growing farm commodities which

Japan needs to import. Another purpose of such assistance is to help the beneficiaries reduce their unfavorable trade balance with Japan, and enable them to buy more Japanese industrial products. Discriminatory sourcing of farm products by Japan in favor of countries in Southeast Asia (including Australia) is having an adverse effect on present and future U.S. exports to Japan, particularly of commodities such as corn, grain, sorghum, tobacco, cotton and others.

Sales of U.S. farm products that have taken place under the Agricultural Trade Development and Assistance Act (Public Law 480, enacted in 1954 and extended periodically since) also provide a typical example of discriminatory sourcing. This law originally authorized sales of U.S. farm products in exchange for local soft currencies, facilitating thereby the purchase of food by needy countries, lacking the necessary hard currency to buy it in world markets. Public Law 480 authorized such sales also in exchange for long-term dollar and convertible foreign currency credits. A 1966 amendment to the Act required that the two latter forms of sales should displace sales for local currencies by 1971. The declared purpose of Public Law 480 is not only to benefit other countries ("to combat hunger and malnutrition and to encourage economic development in the developing countries"), but also "to develop and expand export markets for U.S. agricultural commodities."

United States exports to developing countries under the Agency for International Development (AID) loan and grant programs provide another example. The United States AID policy, in general, requires commodity

procurement charged against AID dollar appropriations to be confined to U.S. sources, with certain exceptions (i.e., commodities may be purchased from selected less developed countries if a major U.S. assistance purpose would be served as a result of such procurement). The less developed countries must agree to accept payment through U.S. source letters of credit, under which the grants are tied to financing imports from the United States. Official U.S. loans other than the ones under the two above-mentioned programs are offered also with procurement restrictions designed to assure stimulation of U.S. exports.

Just as discriminatory sourcing in aid programs is closely related to export subsidies, other forms of discriminatory sourcing are likely to be simply a facet of a more important type or class of nontariff barrier. For example, in government procurement of defense supplies from abroad, many countries will not purchase from certain sources for strategic reasons. State trading organizations commonly exhibit a bias in the sources of their purchases.

One U.S. firm complained to the Tariff Commission that Japan practices discriminatory sourcing in its petroleum imports by giving preference to Arabian suppliers. Japan claims that refineries have no obligation concerning the choice of their purchases; nonetheless, under government guidelines designed to assure a stable supply, a certain share of total imports should come from the Arabian Oil Company.

Some complaints which were received simply reflected long standing trade patterns or cultural ties which the complainant felt were not justified on purely economic grounds. For example, according to some adversely affected U.S. exporters, many of the former French colonies in Africa follow the general practice of designating French firms as their suppliers, discriminating thereby against imports from all other competitive sources.

## Chapter IX

### GOVERNMENT PARTICIPATION IN TRADE

#### Introduction

The trade barriers which have received the greatest public attention are, for the most part, governmental regulatory measures applicable to trade between private parties: Tariffs, quotas, embargoes, licensing requirements, consumption taxes, health and sanitary regulations, product standards, etc.

One of the most important areas of trade distortion, however,--perhaps, even, the most important--is to be found when governments are themselves participants in trade, rather than merely administrative overseers of commerce between private individuals.

Governments participate in trade as purchasers of goods for governmental use, as buyers or sellers of goods for private use, as producers of goods or services sold to the public, as investors in private industry, and through subsidies or other aids to private business.

In theory, trade in which the government participates should provide precisely the same economic advantages as trade between private parties. Trade by the government could conform to the principles of comparative advantage to the same extent as private trade. In practice, governmental trade frequently is found to differ significantly from private trade. Generally speaking, market factors determine the actions of private traders, whereas governments are likely to give strong attention in their trading activities to political, social or other noncommercial considerations. When these considerations largely displace the principle of

comparative advantage, there is a less efficient utilization of the world's resources. It seems generally conceded that government participation in trade usually is accompanied by a redirection of trade from the "normal" pattern which would exist under an unfettered operation of the principle of comparative advantage. Indeed, such a redirection may be the specific aim of the government in order to accomplish a desired social or political goal.

Government participation in trade has grown to an importance scarcely imagined just a few decades ago. Governments have become the largest single purchaser of goods in every major country. The growth in national economic planning in all countries has led to establishment of government monopolies in important products, to the nationalization of basic industries, and to heavy governmental investment in or subsidization of industries considered essential for national welfare. In addition, with the spread of economic socialism a significant part of the world operates under centrally planned economies where all trade is conducted by the state.

The international trade problems which arise from government participation in trade have proven far more difficult to address with any degree of effectiveness than the problems arising from the conventional government regulation of trade. There are several reasons for this. One is the difference in public knowledge or awareness of discriminatory treatment. A tariff or quota, for example, is highly visible to all concerned and, in effect, is a public announcement that imports are to be limited. On the other hand, a charge that the same degree of limitation or discrimination is being secretly accomplished by the private administrative decisions of

government officials in their trading activities can be difficult or impossible to prove. Another reason why problems in the government trading area have been more difficult is that they frequently stem from policies which the government considers basic to the accomplishment of its social or political goals.

The existing international rules for the conduct of trade have been developed with transactions between private enterprises principally in view. The major part of the General Agreement on Tariffs and Trade deals with minimizing governmental regulation or interference with private trade; comparatively little is said on how the government should conduct trade. In fact, an important area of government trading activity--procurement for government use and not for resale--is specifically excepted from the GATT rules. The provisions dealing with state trading, in effect, have not been implemented, and the same can almost be said for the provisions dealing with subsidies.

In the Tariff Commission's present investigation of trade barriers, over 550 complaints were received concerning problems arising from governmental participation in trade. The complaints are summarized in table 9-A,

Table 9-A.--Summary count of complaints made against government participation in trade

Source: Compiled from submissions to the Tariff Commission.

where it is seen that 40 percent of the complaints dealt with governmental subsidies and other aids to private industry. One-fourth of the complaints concerned state trading operations, government monopolies, and exclusive franchises bestowed by governments, and 14 percent were against discriminatory government procurement practices.

Seventy percent of the complaints named developed countries having market economies, 27 percent dealt with developing nations, and less than 2 percent with Communist countries. The distribution of the complaints by country is shown in table 9-B. Japan drew more complaints (13 percent of the total) than any other single country. The six countries which made up the European Community prior to EC enlargement in 1973 received, all together, 21 percent of the complaints; the United States was involved in about 8 percent, the United Kingdom in about 5 percent, and Canada in about 3 percent.

Table 9-C shows the distribution of the complaints by product sector. Products in all 23 industrial sectors and all 9 agricultural sectors were involved. In the industrial area, the largest concentrations of complaints were found in the following sectors: Nonelectrical machinery, chemicals, electrical machinery, transport equipment, and ores and metals. In the agricultural area, the largest concentrations were in beverages and spirits, grains, foodstuffs, and tobacco.

The remainder of this chapter is devoted principally to a discussion of trade distortions which may result from governmental aids to domestic industries, discriminatory government procurement practices, and state trading practices. At the end of the chapter is a very brief summary of

complaints against certain government regulations, policies or practices which have a significant effect on trade but are not covered in other chapters of this report.

## Subsidies and Other Governmental Aids

International trade can be distorted by governmental aids designed explicitly to increase exports (export subsidies), and also by subsidies and aids of a more general nature given to domestic producers if these stimulate exports or cause domestic products to be substituted for imports. Subsidized domestic producers who also sell abroad obtain an artificial competitive advantage in export markets over foreign producers, and they also are given a special advantage in their competition against imported products. General subsidies, therefore, may have essentially the same effect in distorting international trade as export subsidies and import duties. In contrast to export aids, however, general subsidies usually have as their prime objective a purely domestic goal, such as regional development or national defense; and the competitive advantage which general subsidies confer upon domestic producers in foreign markets (against competing exports of other countries), or in the domestic market (against competing imports) usually is only a secondary consequence of the subsidy program.

The trade distortions caused by subsidies and other governmental aids constitute one of today's major nontariff trade problems. Because the subsidies themselves are generally embedded in basic governmental policies which are not readily susceptible to change, this is perhaps the most difficult area in the trade field.

### Defining subsidies

The definition and identification of subsidies presents one of the important difficulties in dealing with the effect of subsidies in

international trade. The absence of an agreed international definition, or of a comprehensive list of practices which are considered to constitute subsidization, has effectively precluded enforcement of GATT provisions in the area of subsidies and has left them, as yet, not subject to meaningful international regulation or surveillance.

There is a considerable diversity of opinions on what constitutes a subsidy; interpretations of the term range from the very narrow to the very broad. A recent staff study prepared for the use of the Joint Economic Committee of the 92nd U.S. Congress defines subsidies as follows:

. . . provision of Federal economic assistance, at the expense of others in the economy, to the private sector producers or consumers of a particular good, service or factor of production. The Government receives no equivalent compensation in return, but conditions the assistance on a particular performance by the recipient--a quid pro quo--that has the effect of altering the price or costs of the particular good, service, or factor to the subsidy recipient, so as to encourage or discourage the output, supply, or use of these items and the related economic behaviors. 1/

The same study also cites Carl Kaysen's definition as a good conceptual statement of the term:

. . . a subsidy to an enterprise can be defined as an increase in the demand for its output, or a decrease in the costs which it must bear to produce its output, which are not the result of market forces . . . ; but rather result from the deliberate action of the subsidy giver (Government). 2/

2/ Carl Kaysen, "On Defining a Subsidy", in Public Policy, Yearbook of the Graduate School of Public Administration, Harvard University, Vol. IV, 1953, p. 5.

Various sources usually concur that subsidies are acts of governments, although it is possible to include grants by private bodies in the definition of subsidies. 1/ In separating subsidies from other governmental measures, it is agreed under GATT rules that subsidies have to involve some loss or other cost to the government. As the above definitions suggest, there is a wide range of government activity that may be regarded as a subsidy. However, the principal forms subsidies may take are generally:

- (a) Explicit cash payments (cash subsidies);
- (b) Implicit payments through a reduction of a specific tax liability (tax subsidies);
- (c) Implicit payments by means of loans at preferential interest rates (credit subsidies);
- (d) Implicit payments through provisions of goods and services at prices or fees below market value (benefit-in-kind subsidies);
- (e) Implicit payments through government purchases of goods and services above market price (purchase subsidies). 2/

#### GATT provisions on subsidies

The General Agreement on Tariffs and Trade has not really been able to deal effectively with the problem of subsidies. This has been in part because of the definitional problem.

---

1/ The U.S. statute relating to countervailing duties (19 U.S.C., 1303 (1964)) is interpreted to consider also grants by private bodies as subsidies, while the generally accepted view of GATT members is that the term "subsidies" covers only provisions by governmental or semigovernmental bodies.

2/ This classification plus an additional category was used in the Joint Economic Committee Study, "The Economics of Federal Subsidy Programs" etc., p. 18.

Article XVI of the GATT requires any contracting party that grants any subsidy (including any form of income or price support) which operates to increase exports from, or to reduce imports into, its territory shall notify the Contracting Parties of the extent and nature of the subsidization and its effect on trade. If it is determined that the subsidization causes or threatens serious prejudice to the interests of any other contracting party, the subsidizing country is required to consult on the possibility of limiting the subsidy.

Section B of Article XVI states that the contracting parties recognize that an export subsidy by one contracting party may have harmful effects for others, and accordingly, contracting parties should "seek to avoid" subsidizing the export of primary products, 1/ If, however, a subsidy is granted, it "shall not be applied in a manner which results in that contracting party having more than an equitable share of world trade in that product."

Furthermore the article stipulates that after January 1, 1958 (or the earliest practicable date thereafter), "contracting parties shall cease to grant either directly or indirectly any form of subsidy on the export of any product other than a primary product which results in the sale . . . for export at a price lower than . . . the comparable price . . . in the domestic market."

Section B of Article XVI also obligates the Contracting Parties to review from time to time their progress in "avoiding subsidization

---

1/ A "primary product" is understood to be any product of farm, forest, or fishery, or any mineral, in its natural form or which has undergone such processing as is customarily required to prepare it for marketing in substantial volume in international trade (as defined by GATT in the Notes to the Article).

seriously prejudicial to the trade interests of contracting parties." To implement this provision, notification procedures were adopted which included the submission of a questionnaire giving detailed information on the nature, incidence, amount, and effect of existing subsidies.

Another GATT Article that indirectly relates to subsidies (Article VI) permits an importing member to impose countervailing duties on imported products, the production or exports of which have been subsidized, if injury or threat of injury to a competing domestic industry has been found. 1/

The General Agreement on Tariffs and Trade offers no comprehensive definition of subsidies; and the contracting parties to the GATT have not agreed on such a definition, or even a binding list of relevant practices, at any time after the General Agreement became effective. This fact can best be explained by the fear of several countries that any particular definition, or the inclusion of some specific act in a binding list, would prevent them from continuing a desired practice of subsidization. However, in an effort to give effect to the prohibition against export subsidies of non-primary products, 17 GATT members 2/ have agreed on an illustrative list of government acts that are to be regarded as export subsidies. This list of practices, which was considered by the parties to this agreement as tentative and nonexhaustive,

---

1/ See the section dealing with countervailing duties in chapter XI.

2/ Austria, Belgium, Canada, Denmark, France, Federal Republic of Germany, Italy, Japan, Luxembourg, Netherlands, New Zealand, Norway, Rhodesia, Sweden, Switzerland, United Kingdom and United States.

is indeed far from a complete list. The practices in the list are as follows: 1/

- (a) Currency retention schemes or any similar practices which involve a bonus on exports or re-exports;
- (b) The provision by governments of direct subsidies to exporters;
- (c) The remission, calculated in relation to exports, of direct taxes or social welfare charges on industrial or commercial enterprises;
- (d) The exemption, in respect of exported goods, of charges or taxes, other than charges in connection with the importation of indirect taxes levied at one or several stages on the same goods if sold for internal consumption; or the payment, in respect of exported goods, of amounts exceeding those effectively levied at one or several stages on these goods in the form of indirect taxes or of charges in connection with importation or in both forms;
- (e) In respect of deliveries by governments or governmental agencies of imported raw materials for export business on different terms than for domestic business, the charging of prices below world prices;
- (f) In respect of government export credit guarantees, the charging of premiums at rates which are manifestly inadequate to cover the long-term operating costs and losses of the credit insurance institutions;
- (g) The grant by governments (or special institutions controlled by governments) of export credits at rates below those which they have to pay in order to obtain the funds so employed;
- (h) The government bearing all or part of the cost incurred by exporters in obtaining credit.

The uncooperativeness or inability of the contracting parties to agree on a definition of subsidies or on a binding list of pertinent

---

1/ From GATT, Basic Instruments and Selected Documents, Ninth Supplement, 1961, pp. 186-187.

practices which would constitute a subsidy has made the effective implementation of the GATT rules next to impossible.

The lack of a definition weakened the usefulness of the GATT reporting procedures on subsidies, enabling governments to interpret and apply (or ignore) the GATT rules according to their own interest. Several countries have felt free not to mention certain governmental acts that clearly should have been reported, implying (or sometimes claiming explicitly) that these did not constitute subsidies or trade barriers as they saw them. For example, a GATT review of notifications observed that, despite the fact that subsidies for shipbuilding are common in several countries, reference to them was made in one instance only. Another example the reviewers noted was a range of tax deferrals or deductions, and government aids in the area of insurance and export credit financing, all destined to promote export sales, that were employed in France and Japan, but not reported by those countries. It was noted further that numerous cases of direct payments to domestic industries had not been reported, such as subsidies to coke producers paid by some European Community countries, and subsidies to the motion picture industry in several countries such as France, Italy and the United Kingdom. In general, compliance with the notification requirement has been poor; some countries did not respond at all, and even on the reported practices information was far less specific than requested. Neither have GATT provisions on consultative procedures been made use of to any meaningful degree.

The GATT provision relating to the subsidization of only primary products has lent itself to implementation even less than the rest of

the GATT subsidy rules, owing to its liberal wording, and the lack of a clear concept on what constituted "an equitable share of world trade." Since the acceptability of specific agricultural subsidies under the GATT is to be determined on this basis, this provision has had little practical effect in checking the rapidly increasing use of agricultural subsidies by most countries.

#### U.S. provisions

Not only has the GATT failed to come up with a comprehensive definition of subsidies; U.S. laws do not offer one either. The countervailing duty statute 1/ provides for the assessment of special "countervailing" duties on imports which enter the United States with the benefit of a foreign subsidy. This statute uses the terms "bounty" or "grant"--roughly earlier synonyms for subsidies--but the statute does not define what bounties or grants are. Neither have pertinent administrative regulations issued by the Treasury Department or the Bureau of Customs stated what practices are considered to be bounties or grants for the purposes of the statute.

The history of U.S. countervailing actions gives some insight into the concept of "bounties" and "grants" used by the U.S. Treasury Department in making its countervailing determinations. It appears that the government actions described in the illustrative GATT list generally coincide with the U.S. list of foreign practices to be countervailed. 2/

---

1/ Section 303 of the Tariff Act of 1930 (19 U.S.C. 1303).

2/ Illustrative examples of the types of foreign practices against which the United States has applied countervailing duties are given in chapter XI under the section dealing with countervailing duties.

However, opponents of U.S. countervailing practices believe that the U.S. interpretation of "bounties" and "grants" is too broad, and will invite foreign retaliation against numerous existing U.S. subsidies, the foreign counterparts of which the Treasury Department has countervailed against.

Provisions of the European Community and the  
European Free Trade Association

The charters of the major regional economic organizations also have provisions against government aids that have a restrictive or distortive effect on intraregional trade and competition. The Treaty of Rome that established the European Economic Community provides in Article 92 that "any aid . . . which distorts or threatens to distort competition by favoring certain enterprises or certain productions shall, to the extent to which it adversely affects trade between Member States, be deemed to be incompatible with the Common Market." The article also lists types of aids which shall be deemed to be compatible with the Common Market and aids which may be deemed compatible. Among the aids which may be deemed to be compatible are aids for economically depressed areas, or aids to remedy "a serious disturbance of the economy of a Member State."

The Convention establishing the European Free Trade Association prohibits, in Article 13, in addition to a specific list of export subsidies, "any other form of aid, the main purpose or effect of which is to frustrate the benefits expected from the removal or absence of duties and quantitative restrictions on trade between Member States."

### Subsidies which affect international trade

Subsidies which reduce the cost and prices of domestic products that have import competition may limit imports through substitution of imports by the subsidized domestic products. Subsidies which have an export promoting effect either lower the cost for domestic producers or cover losses occasioned by international sales below domestic prices. In both cases, the domestic producer is induced to produce and export more of the product. To insure that such increase in total output will be purchased by foreigners, however, foreign demand (a) must consist of a significant portion of the market and (b) must be relatively elastic. If foreign demand is inelastic, export prices will fall substantially as a result of increased supply, and the domestic producer will have to share the benefit of the subsidy with the foreign consumer. Foreign demand may account for too small a share of the market or may be inelastic to an extent that it defeats the purpose of the subsidy.

### Subsidies with an import substitution effect

Governments generally will admit more freely to subsidies that can have an import limiting effect, since these are not so explicitly prohibited by GATT rules as are export subsidies. While the adverse effect on international trade and efficient allocation of world resources of such aids is sometimes undeniable, the government granting the subsidy feels it is justified by domestic considerations. For example, the assistance of the United Kingdom Government to its domestic aluminum industry, given mainly in the form of concessional loans, reduced transport and electric power costs, and served predominantly to cut down on

United Kingdom aluminum imports coming mostly from Norway and Canada. At the same time, however, these subsidies are part of a regional development program for a depressed area of the country. In several advanced industrial countries, assistance given to the textile industry is designed to counteract the disruptive effect of the industry's decline on companies and workers. Such government aids have, however, an adverse international trade effect for the textile exports of less developed countries, which do not have many alternative possibilities of exporting industrial products.

The "adjustment assistance" which the United States and other governments extend to firms adversely affected by increased imports might also be construed as a form of subsidization with an import-limiting effect. Under the Trade Expansion Act of 1962, firms can receive technical assistance, loans, and tax benefits, if the increased imports injuring their interests are found to have resulted in major part from trade concessions.

Another example of import limiting subsidization is the assistance given to coal production and consumption in certain countries of the European Community. The purpose of these subsidies is to sustain indigenous energy sources, cut down on imports of coal, and substitute domestic coal consumption for part of oil imports. In Canada, a recent measure provided for a systematic search for possibilities of import substitution.

### Subsidies with an export promoting effect

Export subsidies are those designed specifically for the purpose of stimulating exports, and are frequently calculated in relation to actual exports, and usually are given directly to exporters. General subsidies may also lead to an expansion of exports.

Subsidization of agricultural exports has been principally by direct cash payments on exports (cash subsidies), or through direct sales by the government at world market prices of products the government formerly purchased at higher prices from the farmer (purchase subsidies). Such subsidies on agricultural exports have been employed, for example, both by the European Community and the United States. Governments rarely admit to the granting of direct export subsidies on industrial products, since these would be controversial under GATT rules. Sometimes, however, they do admit to a number of government actions which, while not explicitly export subsidies, may have an export-promoting effect. Some such techniques affecting all types of exports are described below.

### Government aids to export financing

Government aids to export financing (credit subsidies) constitute probably the fastest growing area of subsidization in the international trade field in recent years. Export financing at concessional rates and export credit guarantees have been provided by governments of all major industrialized countries for many years. The United States extends such assistance principally through the Export-Import Bank of Washington. The activities of this government facility include the provisions of

direct loans, guarantees of loans made by commercial banks to foreign buyers of U.S. exports, and insurance and guarantee of credits extended by exporters. The purpose of these operations is to finance U.S. exports that would not otherwise be purchased. Concessional financing by the U.S. government of agricultural exports under various laws has been especially significant in some past periods.

Most U.S. trading partners have arrangements similar to those of the United States for export financing aids. Medium-term and long-term export credits in France are financed by private companies but then refinanced by special government-controlled credit institutions. The Export-Import Bank of Japan also directly finances long-term and medium-term export credits, charging significantly lower interest rates than commercial banks. The Japanese Government insures exporters against a wide range of risks, even against the risk of tariff increases in export markets.

In the United Kingdom, the Export Credit Guarantee Department (ECGD) provides credit insurance to exporters, guaranteed rates of return to banks, and refinancing of bank credit in order to keep export credit rates on a low level.

The purpose of concessional financing is to provide credit for the purchase of a country's exports on terms which are unavailable from the private sector. Most trade among industrialized countries is conducted without recourse to such arrangements because of the greater financial liquidity of these countries. Concessional financing has largely been

used to support sales to developing countries, but there is a growing tendency for governments to guarantee financing on concessional terms on transactions between industrialized nations.

Within a country, the firm with the stronger capital structure or better access to outside capital sources can offer better credit terms to customers than the smaller manufacturer who cannot, himself, carry all or part of the credit risk; the seller with the better credit terms gains the customers. Between countries, when manufacturers need help in financing credit to an importing country, the country whose banking community (or government) is more cooperative is likely to gain the export business.

For more than a decade, the governments of the major countries have been engaged in intense competition in the financial terms which they will provide on their own exports. A common practice among major exporting countries has been to insulate interest on financing for exports from variations in domestic interest rates, generally by formally instituting relatively automatic discounting for export paper at interest costs pegged below market rates, and financing from the public treasury the differential between the interest costs on domestic commercial credits and those extended to finance exports. Such measures make funds available to banks for export financing at less than market costs and permit exporters to offer concessionary financing to foreign importers. For example, in the fall of 1970, France was providing export financing at rates of 4.5-6 percent, compared with a central bank domestic discount rate of 7 percent and domestic rates on comparable paper of about

10 percent. Similar figures could be found in the other major exporting countries.

The types of export credit guarantees, insurance, and other financial arrangements provided by government agencies in Canada, France, Japan, the United Kingdom, and the United States are briefly summarized in the following pages.

Canada.--The Export Credits Insurance Corporation (ECIC) is a semi-autonomous government-owned corporation established by Canada in 1944 to insure export credits and provide long-term export financing when it is unavailable from commercial sources.

The ECIC has two main types of insurance, global and specific. The global policy is available for short-term credits covering consumer goods and miscellaneous general commodities shipped on consignment for sale or exhibition purposes. The specific policy is applicable to all persons or corporations in Canada exporting goods or providing engineering, construction, technical and similar services to clients in foreign countries on a deferred-payment basis. This policy is usually issued to cover medium-term credits. The ECIC does not cover risks which can be insured by the commercial insurer, American Credit Indemnity, which insures commercial risks on Canadian sales to the United States.

Exporters of capital goods, in general, finance their medium-term export credits (one to five years) with the commercial banks and may refinance them with the Export Finance Corporation of Canada, Ltd. (EFC). Transactions carried out on a long-term basis through buyers' credits generally are carried out by the ECIC. The primary purpose of the EFC

is to refinance medium-term suppliers' credits and to insure that the cost of financing these credits are comparable with the costs in other countries.

France.--In the European Community, each member country institutes its own insurance and export credit programs. Since many of the programs practiced in the Community are similar, the French program is used here to typify the actions of the Community.

The French credit insurance program is operated by the Compagnie Francaise d'Assurance pour le Commerce Extérieur (COFACE), which was established in 1946. The purpose of COFACE is to administer the government export credit insurance program and to guarantee, in general, all foreign trade transactions.

Transactions eligible for insurance by COFACE include sales of goods, provision of services (i.e., preparation of studies, technical assistance, participation in trade fairs, etc.) and execution of public works abroad. In respect to these transactions COFACE insures short-term and medium-term suppliers' credits as well as long-term export credits (including both buyer and supplier credits).

Global insurance policies covering commercial risks are available to exporters from COFACE for short-term transactions. Noncommercial risk coverage is available on demand by the exporter. Specific insurance policies covering commercial and/or noncommercial risks are available for medium and long-term transactions. Guarantees for investments connected with noncommercial and transfer risks 1/ in export operations are available to exporters where foreign buyers have difficulty in assessing the reliability of the importing enterprise.

---

1/ Transfer risks cover the insured persons' inability to repay all or part of the funds invested due to political or economic events occurring outside France.

Arrangements for financing suppliers' credits are made by banques de dépôt (deposit banks) and/or banques d'affaires (investment banks), in cooperation with the Banque Francaise du Commerce Extérieur (BFCE). The function of the BFCE is to facilitate the financing of exports by way of endorsements, acceptances, discounts or any other form of short or medium-term credit.

Loans are granted by the French Government to foreign governments, public authorities or enterprises of countries situated outside the franc area and not owned by citizens of EC countries. These loans include tied loans for the repayment of French exports, direct loans for refinancing down payments and untied loans.

In addition to the above mechanisms, there are two other particularly significant incentives operating in France that help facilitate the financing of export transactions. One incentive relates to the fact that profits of the deposit and investment banks realized from financing of exports are exempt from the turnover tax. The second incentive is that banks can build up, within limits, tax-free reserves to protect themselves against possible export losses. By the lure of profits and tax shelters the French Government hopes to encourage more exports by the business community.

Japan.--As in the other major countries, the credit insurance facilities of Japan play a major part in determining the availability of financing for exporters. The Japanese export insurance programs are operated by the Ministry of International Trade and Industries (MITI). All insurance premiums and losses flow to and from the Export Insurance Special Account established and financed by the Treasury.

There are eight types of export insurance offered in Japan:

General export insurance, export proceeds insurance, export bill insurance, export finance insurance, consignment sales insurance, overseas advertising insurance, overseas investment profits insurance, and overseas investment principal insurance. The types of insurance most frequently used are the first six, and by far the most important of these is general export insurance, which accounts for 60 to 75 percent of all contracts insured.

General export insurance can be obtained for exports of equipment produced, processed or purchased in Japan and for exports of other goods designated by MITI. The risks covered include both commercial and noncommercial risks as well as increases in freight or marine insurance owing to rerouting due to noncommercial reasons. The maximum risk cover is 60 percent in the case of commercial risks and 90 percent in the case of noncommercial risks. Export proceeds insurance is available for goods designated by MITI and covers the major commercial and noncommercial risks. Export bill insurance insures against the risk of nonpayment of export bills by the buyer. When an exporter suffers a loss due to commercial or noncommercial reasons, he is eligible for a loan to cover his debts incurred. This loan can be insured under the export finance insurance program. Losses arising from the inability of the exporter to recover his goods on consignment sales are covered under consignment sales insurance programs. Overseas advertising insurance covers the exporter against losses resulting from non-amortization of expenditures incurred in connection with existing advertising abroad.

Japanese export credits are financed by the commercial banks and the Export-Import Bank of Japan. The Export-Import Bank of Japan, established in 1950, is the foremost institution in the financing of medium and long-term credits. If the Bank decides to participate in a requested loan, its share in financing is expressed as a percentage of the contract price, less down payment and profit. The buyer is usually asked to make a down payment of about 20 percent of the value of the contract and to obtain a repayment guarantee for the remainder from a reliable bank in his own country.

In financing the export credit itself, both the Export-Import Bank interest rate and the commercial bank interest rate have to be considered. The rate charged by the Bank when financing 70 to 80 percent of the credit varied between 4.5 and 5.5 percent for fiscal year 1972. In determining this rate, the degree of urgency in developing and securing markets for Japanese exports is considered. When a commercial bank participates with the Export-Import Bank in financing credit, the interest rate charged is the same as the rate on domestic term loans to prime rate customers, usually 8.0 to 8.5 percent.

United Kingdom.---The Export Credits Guarantee Department (ECGD) was established in the early 1920's. The ECGD has over 20 different guarantee and insurance programs from which an exporter may choose. The two main types are the comprehensive and the specific policy. Under the comprehensive policy the ECGD will insure all of an exporter's trade or his trade with a balanced group of markets ("good" and "bad" risk markets). The main guarantee program is the direct bank guarantee.

Direct bank guarantees fall into two categories, specific and comprehensive. The specific guarantee usually applies to goods sold on payments for more than two years. Financing arrangements are made available to the exporter at a fixed rate, and the bank is provided with unconditional cover against loss. <sup>1/</sup> The comprehensive guarantee applies to goods sold on payment for less than two years. It is issued to the exporter's bank and provides unconditionally for payment by ECGD to the bank three months after due date in the event of nonpayment by the importer.

United States.--The Export-Import Bank of the United States (Eximbank) is perhaps the most important source of medium- and long-term financing for U.S. exports. It has been estimated that Eximbank direct loans provided the credit for about 7.5 percent of U.S. exports in a recent year.

The Export Expansion Finance Act of 1971 amended the Export-Import Bank Act of 1945 to enable the Eximbank to continue its operations with substantially increased overall commitment authority. The purpose of the Act is to enable expansion of U.S. export trade chiefly by (1) increasing the overall limitation on the amount of loans, guarantees and insurance which the bank may have outstanding at any one time from \$13.5 billion to \$20 billion; (2) increasing from \$3.5 billion to \$10 billion the amount of outstanding guarantees and insurance which Eximbank may charge on a fractional reserve basis against its overall limitations; and (3) removing the prohibition against the extension of

---

<sup>1/</sup> The fixed rate in 1972 was 5 percent, while the current bank rate was 6 percent.

any credit or guarantee insurance on exports to the nations of Eastern Europe.

The Act also directs Eximbank to provide export financing with rates, terms, and other conditions which are competitive with the government-supported export financing available in major foreign countries and to accord equal opportunity to small enterprises, such as export agents and managers, independent export firms, and small commercial banks, in the formulation and implementation of its policies.

Two Eximbank programs to increase U.S. exports are the Direct Credit Program and Participation Financing. The Direct Credit Program is used mainly in financing heavy capital equipment and technologically intensive projects in such fields as nuclear power, communications, transportation, steel production, and mining. It is designed to supplement private sources of financing where they are unwilling or unable to assume the commercial and noncommercial risks, and offers financial guarantees for loans made. During fiscal year 1972, 614 direct credits were authorized, totaling about \$2.3 billion to buyers around the world.

Participation financing is a means of drawing private funds into financing large capital equipment and technologically intensive projects. Under this scheme an importer using the deferred-payment plan continuing for five or more years makes a cash payment of 10-15 percent of the U.S. contract price. The remaining amount is financed equally by loans from Eximbank, which are eligible for financial guarantees, and by private lenders. In October 1973, the interest rate charged by Eximbank for these loans was 6 percent.

Another important financing program of Eximbank is the commercial bank exporter guarantees. This program is designed to help medium-sized exporters. Under this program, before the recent change the commercial bank carried the beginning installments of the credit up to 30 percent for its own account and Eximbank gave an unconditional guarantee on all later installments, which covered payment of interest up to 6 percent. At present, the lending banks are no longer required to carry some portion of the loan without an Eximbank guarantee. Also the rate of interest guaranteed is no longer limited to 6 percent, but is related to the prime rate of the lending bank. Authorization for commercial bank export guarantees in FY 1972 amounted to \$493.4 million.

The U.S. credit insurance program is operated by the Foreign Credit Insurance Association (FCIA) in collaboration with Eximbank. The FCIA is comprised of 50 principal United States marine, casualty, and property insurance companies. The FCIA insures commercial risks for its own account and noncommercial risks through Eximbank. A new agreement signed in 1972 provided FCIA with broadened powers and authority to commit insurance as an agent of Eximbank. The result of this agreement is that export transactions which previously would have required submission to Eximbank can now be committed by FCIA without prior approval by Eximbank. Overall authorizations of export credit insurance by FCIA in FY 1972 totaled \$2.2 billion.

At the close of 1973 there was pending in the U.S. Congress legislation to amend the Foreign Assistance Act of 1961 by providing for the establishment of a new U.S. Export Development Credit Fund, financed

by borrowings of the U.S. Treasury. The proposed fund would offer financing for U.S. exports to the lowest income countries (i.e., those with per capita income of \$375 a year or less). The loans would be provided on concessional terms with interest rates of not less than 3 percent per year, repayment within 30 years and a grace period on principal of not more than 5 years. The fund would be authorized to make loans of up to \$3 billion during 3-1/2 years beginning July 1, 1974. The interest subsidy on the loans, equal to the difference between the effective cost of borrowing and the concessional interest rate charged, would be financed by repayment made on past foreign assistance loans. At the time the Senate Finance Committee held hearings on this proposal, the prime domestic interest rate was 9-3/4 percent.

#### Special tax advantages for exporters

Several governments provide special tax advantages to exporters. This is done usually by exempting or deferring taxes on income from export activities, or rebating other direct taxes associated with the production of exported products, or by accelerated amortization of assets used in production for export.

Under current GATT rules, indirect (consumption) taxes may be rebated (or not collected) on exported products, but rebates of direct taxes (income and certain other taxes) 1/ are not permitted. This rule is based on the premise that indirect taxes are fully shifted forward to the consumer, whereas direct taxes are not. To the extent,

---

1/ See the section on border tax adjustments in chapter VII.

however, that the forward shifting of indirect taxes is incomplete, the full restitution of the domestic consumption tax at the border on exported products acts, in effect, as a subsidy of exports.

Italian Law 639 provides for the rebate of a number of Italian taxes (both direct and indirect) on exports from Italy of over 400 industrial products specified in that law. The U.S. Treasury Department has held that the restitution of direct tax payments constitutes a subsidy of exports and has applied countervailing duties against several Italian products, including radio transmission towers, welded steel wire mesh, ski lift towers, and compressors for refrigerators and other appliances.

Many countries have income tax deferral or exemption schemes designed to promote their exports. For example, some countries exempt from tax the sales income of foreign subsidiaries, some allow special reserves or deductions for expenses incurred in establishing export markets, and others provide tax incentives for capital investment which results in exports. France, Belgium, and the Netherlands do not tax the profits of foreign subsidiaries. France generally does not tax profits of a foreign branch, and a substantial portion of foreign branch profits are likewise not taxed in Belgium and the Netherlands. Italy provides partial exemption from tax of profits of foreign selling branches. In West Germany, the tax on profits of foreign subsidiaries is deferred until the profits are repatriated as dividends, at which time there is a partial tax exemption if the subsidiary is 25 percent German owned. Norway and Denmark exempt from tax one-half of the income from foreign branches.

Tax deferral has also been an inducement to U.S. private foreign investment. In the United States, the tax on profits earned through foreign corporations is delayed until the profits are remitted to the U.S. taxpayer as dividends. Until they are distributed, profits generated abroad may be used for tax-free corporate financing. There a foreign country's corporate tax rate is less than the U.S. corporate tax rate; deferral provides a company with the tax incentive to reinvest profits in the foreign company. Although the elimination of deferral was proposed in 1961 because of abuses to the system, in 1962 Congress retained tax deferral while tightening up the regulations surrounding it.

Congress has recently extended deferral to domestic exporting corporations. In order to counterbalance the comparatively higher tax burden of U.S. export sales, the United States has recently provided for special tax treatment on income from exports in Title V of the Revenue Act of 1971. This act provides for the establishment of special export sales corporations called Domestic International Sales Corporations (DISCs). The DISCs are permitted to defer taxation on one-half of their export income if that half is retained; no deferral can be made on income distributed to shareholders. DISCs can also increase earnings eligible for tax deferrment by some export promotion expenses, including 50 percent of the cost of shipment by U.S. ships or aircraft. DISCs may invest their tax-deferred earnings in the expansion of their export-business and in certain Export-Import Bank obligations. Moreover, DISCs may make their tax-deferred earnings available to the parent company or other domestic manufacturers of export-goods in the form of so-called

"producers loans." In order to qualify as a DISC, a corporation must confine its activities almost entirely to export selling and related activities.

Although the DISC legislation was enacted to counteract export subsidization inherent in tax deferral schemes for exports maintained by several U.S. trading partners, some of these countries have condemned the DISC provision as U.S. subsidy which contravenes the provisions of the GATT. Opponents to the DISC contend that, although the provision is purportedly a tax deferral and not a tax exemption, for practical purposes deferment is indefinite, since it lasts as long as profits are reinvested in export activities. Some have argued that such deferment constitutes interest-free loans to U.S. exporters, and moreover, that deferments have a cumulative effect over the years.

#### Export promotion services

Governments of all developed countries and many of the developing nations provide various services to foster exports of their domestic industries. The extent of the services differ considerably from country to country, but generally include research of potential export markets, trade missions, trade fairs, and marketing assistance. Many countries will assist in advertising abroad, supply translation services, help in product design, arrange overseas visits and provide legal and protective services abroad.

Because export promotional activities by governments represent long established practices, their subsidy aspects tend to be overlooked.

Exporters normally bear only a fractional part of the cost of these services through their taxes, but benefit substantially and directly.

In the Commission's survey of trade barriers, several complaints of U.S. producers against foreign subsidies were concerned with the enhanced competition from foreign products, both in the U.S. market and in foreign markets, which the U.S. producers felt resulted from the aids provided by other governments for export promotion services to their domestic industries. Many U.S. producers complained that they did not get assistance from the U.S. government equal to that received by their foreign competitors.

The export promotion budgets of the national governments of seven of the major countries are compared in table 9-D.

Table 9-D.--Export promotion budgets relative to exports of manufactured goods, 1969

Countries	Exports of manufactured goods	Export promotion expenditures	Export promotion expenditures per \$1,000 of manufactured goods exports
	<u>Billion</u> <u>dollars</u>	<u>Million</u> <u>dollars</u>	
Canada-----	8.5	7.7	\$0.91

### General export subsidies

Export promoting subsidies, especially funds earmarked for research and development or capital assets, are frequently allocated selectively to export-oriented product areas. Some export-stimulating government aids, however, such as the above-mentioned export promotion services, may be applied across the board to all products. Even across-the-board direct export subsidies have been used in the past to correct the balance-of-payments disequilibria in lieu of making appropriate adjustments in exchange rates. Such direct subsidies on all exports are mostly referred to as "general export subsidies." In the second half of the 1960's, for example, France temporarily sought to improve its balance of payments by refunding certain direct taxes on wages of labor used in production of exports.

### Subsidies in specific economic sectors

A brief description follows of certain government aids granted by major trading countries in selected economic sectors that are materially and widely subsidized. Examples of aids mentioned are illustrative of subsidies that presently exist (or have existed in recent years).

Coal and petroleum.--The coal and petroleum industries are widely subsidized by governments that wish to sustain indigenous energy resources. In the European Community, in 1967, the total average subsidy of bituminous coal amounted to \$7.56 per metric ton, i.e., over 40 percent of the price. Under a new system of reduced subsidization established in December 1969, the member states were authorized to grant

production aids not exceeding \$1.63 per ton to undertakings that deliver coking coal for the iron and steel industry. "Disposal aids" on deliveries to destinations within the Community far away from the coal basin were additionally authorized to be applied under specified conditions.

In the Federal Republic of Germany, federal and state assistance to coal production and consumption is substantial. Since coal is the only significant domestic source of energy, various subsidies, including tax concessions, amounted in 1972 to approximately DM 1.2 billion. Subsidies included grants to encourage the use of EC coal instead of imported oil in the electrical industry. In addition to contributions to the cost of initial coal furnace construction, a variable subsidy is being provided to compensate power plants, at least partly, for the additional cost of the Community coal they use, as related to that of fuel oil. The use of EC coking coal instead of imported coal in the iron and steel industry is similarly subsidized. The international trade effect of subsidies to the coal industry is found mostly in the substitution of EC coal for imported fuels, including U.S. coal.

The decline of U.S. coal exports to the Community in general may have been partly the result of subsidies to the EC coal industry and other nontariff controls; but it was caused also by recent shortages in the U.S. supply and by partial replacement of U.S. coal by cheaper British and Polish coal and other substitute fuels in the Community.

U.S. coal exports may also have been adversely affected in the markets of Japan and the United Kingdom by subsidization of the coal

industry in these countries, and on the Japanese market, additionally by aids to the coal industry in Canada. Canada subsidizes the transport costs of coal exported to the Far East, competing thereby more effectively with U.S. coal exports to Japan. The Japanese Government has aided its coal industry by providing long-term interest-free loans. In the United Kingdom, a recent program announced in December 1972, allocated about \$3 billion for assistance to the coal industry over the next five years.

The U.S. Government aids the petroleum industry by an oil depletion allowance from the tax liability of producers, and other write-offs. The industry receives direct grants in some other countries and special tax privileges in most.

Electronics.--Electronics, as a growth industry and standard bearer of technological progress, receives government aids in a number of industrial countries. In recent years, France and the Federal Republic of Germany have provided low interest or interest-free loans to firms in the industry. In 1972, the federal budget of West Germany provided subsidies of DM 43 million for "promotion of electronic data processing." The Governments of the United Kingdom and France support their domestic private computer industry by significant grants, and also by participating directly in the industry. In 1972, all forms of British grants that went directly or indirectly to the computer industry exceeded \$30 million. Part of such subsidized British computer exports go to the United States.

Japanese Government aids to its electronics industry appear most damaging to U.S. trading interests. In the framework of its export promotion policy, and under laws enacted in 1957 and 1971 specifically concerning the industry, the Japanese Government has provided the electronics industry, especially in the area of research and development for computers and sophisticated industrial products, with massive financial assistance in the form of low-interest loans, grants and tax incentives.

The U.S. electronics industry claims that the Japanese subsidy program, coupled with other trade barriers erected against U.S. exports to Japan, enabled Japanese electronic products to compete effectively on the home market against U.S. products, while enormously strengthening the competitive position of Japanese products in the United States. Moreover, upon complaints made by U.S. manufacturers, the Treasury Department is presently investigating whether certain consumer electronic products from Japan benefit from subsidies within the meaning of the U.S. countervailing duty provisions.

The complaints of U.S. electronics manufacturers regarding Japanese subsidization of its electronics industry are challenged by the Japanese, as well as by interested U.S. importers. These claim that over the years U.S. assistance to the domestic electronics industry has been incomparably greater than the Japanese Government's assistance to its own industry, if massive research and development subsidies of the U.S. Government to U.S. producers are taken into consideration.

Although a large portion of the U.S. subsidies have been allocated for defense and space objectives, they have provided the technological foundation for many industrial and consumer electronic products. U.S. importers claim that this fact should be kept in mind in considering action on the demand by U.S. manufacturers of such products that countervailing action be taken against the subsidies benefitting Japanese exports.

Both the U.S. and the Japanese Governments assist the electronics industry substantially through government contracts, but to what extent these should be considered as subsidies is open to argument.

Films.--The film industry enjoys government aids to production, distribution, exhibition and exports in various combinations in different countries. The United States does not subsidize the industry, but all major U.S. trading partners and many other countries do. The competitive position of the unsubsidized U.S. films is thus adversely affected on the international free-world market, of which the U.S. share is about 60 percent. U.S. interests are hurt predominantly by subsidies granted by the United Kingdom, Italy, and France. However, American film companies frequently qualify to share foreign subsidies; therefore, they are attracted by them (in addition to other factors) to produce abroad, with concomitant adverse affects on the U.S. domiciled film industry.

Shipping, shipbuilding.--Shipping and shipbuilding is widely subsidized owing to the relationship of these industries to foreign

trade, the specific problematic nature of the shipbuilding industry, 1/ and the fact that these industries relate to national defense. Subsidies take various forms, including investment grants, preferential credit rates, tax exemptions, premiums for breaking up ships that are to be retired. Sometimes subsidies given directly to the shipping industry go at the same time to the shipbuilding industry, since they are tied to domestically built vessels. A number of countries, including the United States, support the shipping industry by practicing "flag discrimination," i.e., restricting the shipment of certain cargo to national flag ships or limiting the freedom of foreign flag ships to engage in seaborne commerce to and from their ports. 2/

Some countries support shipbuilding to the point where it can meet the demands of a national merchant marine and navy, and make no attempt to export to third markets. Principal examples are: The United States, Canada, and Italy. Merely to satisfy domestic demands and be self sufficient, the United States has to subsidize its shipping and shipbuilding more than other industrial countries do. Subsidies to the U.S. shipping industry are generally paid on U.S.-made vessels only, hence the U.S. fleet is virtually wholly domestically produced. To compensate for high U.S. production costs, U.S. subsidies to shipbuilding amount to over half of construction costs, while in the case of other countries, such as members of the European Community and Japan, they generally stay below 15 percent. In 1965, U.S. grants to ship construction amounted to

---

1/ The long time required in executing contracts, technological obsolescence, uncertainties in projecting demand, large scale credit operations, etc.

2/ See also chapter XII on discriminatory ocean freight rates.

\$93 million. In the same year over \$200 million was paid by the U.S. government as operating subsidies to the shipping industry.

In Italy, subsidies are paid for the construction and equipment of metal-hulled merchant vessels. The subsidy for each vessel is not less than 10 percent of the cost. Where foreign or used products are used in the construction, the amount of the subsidy is reduced. The Italian Government also grants loans at preferential rates to shipowners for construction, modification, or repair of merchant vessels.

Important exporters of ships, such as Japan and to a smaller extent West Germany, subsidize their exports while preventing at the same time imports of foreign ships. Direct subsidies of the Federal Republic of Germany to the local shipbuilding industry amounted to DM 39 million in 1972. The Government considers this a "maintenance aid" designed to make the industry competitive with foreign shipyards, which are also subsidized. Reportedly, additional financial assistance is given to the German Merchant Marine, which invariably places its orders with German shipyards. Japan's share in world ship production rose from 10 percent in 1953 to 50 percent in 1968. The principal markets for such subsidized ship exports are countries, such as the United Kingdom, that possess large fleets and, even though they frequently are exporters themselves, are willing to import as well. Moreover, flag-of-convenience fleets, such as the Liberian, Greek, and Panamanian, are also important outlets for subsidized ship exports.

U.S. export interests in ships is not materially hurt by foreign subsidization, since the United States does not compete on third markets. On the other hand, the export interests of certain foreign

countries, such as the United Kingdom, Poland, Portugal, and Yugoslavia, are adversely affected by the subsidization of shipbuilding by the U.S. government.

Various other industries.-- In addition to the aforementioned few, other manufacturing industries receive government aids which may affect international trade. A well subsidized growth industry, besides electronics, is the aircraft industry. A well known example in this field is the subsidization in France and the United Kingdom of the supersonic commercial aircraft. Moreover, the RB-211 engines, the production of which the United Kingdom supports heavily, are exported at this time exclusively to the United States.

In some countries the steel industry and the paper and pulp industries are subsidized, with concomitant effects on international trade. The textile industry obtains government aids in several advanced industrial countries, and such aids, insofar as they stimulate production, may be injurious to the export interests of less developed countries. Aids to the textile industry take various forms, such as compensation for cost of scrapping machinery, investment grants and loans, aids for research, etc. Chronically depressed industries are also subsidized by several governments. As mentioned before, the United States and other countries aid such industries in the framework of an "adjustment assistance."

Establishments in almost any industry can obtain government aid in some countries if they are located in so-called development areas (principally the EC countries and the United Kingdom). For example,

the aluminum industry of the United Kingdom obtains massive investment grants and low interest loans as part of regional economic assistance programs. However, exporters of aluminum to the United Kingdom (mostly Canada and Norway) claim that such subsidies are injurious to them since they promote the replacement of imported aluminum by domestic production. They further claim that, since subsidized aluminum production in the United Kingdom is uneconomic, regional development aids by the United Kingdom Government represent in this case an undesirable shift towards a less efficient allocation of world resources.

In most advanced countries several industries receive government aids for research and development. U.S. subsidies are devoted principally to atomic-, space-, and defense-related projects and medical research, whereas in other countries, these subsidies are frequently aimed far more directly at general products for industry or consumers and act as stimulators to exports or import substitution in the subsidized industry, and, as such, can be regarded as nontariff barriers.

#### Agricultural products

Subsidies are widely applied in agriculture. In the framework of their agricultural policies, the governments of most industrial countries aid some sectors of their domestic agriculture materially, protecting it, at the same time, from import competition principally by various nontariff barriers discussed elsewhere in this report. Subsidization may take the form of direct payments to the farmer per unit of acreage, output, or exports, or consist of purchases by the government of surpluses

at supported prices, or be a combination of both. These subsidies stimulate exports directly or indirectly, or promote the substitution of imports by domestic production, or both. In addition to direct aids, governments aid agricultural production and exports in a number of indirect ways such as subsidies for fertilizers, disease eradication, research, information services, rural electrification, soil and water conservation, transportation to ports, etc.

Heavy subsidization of production and exports in many countries has led on several occasions to worldwide surpluses in certain farm products such as grains and dairy products. Subsidization has increased competition for markets, and invited retaliatory subsidization by other countries. Such competition in subsidization between countries has led in turn to low and unstable world prices, and major distortions of world production and trade in many affected farm products.

Canada.--Canada provides both direct and indirect aids to assist its domestic agriculture, including direct income support for grains and other key farm products and reduced transport costs for wheat and flour to export ports. Price support for commodities has been mainly through deficiency payments; prices of some commodities are supported through government purchases.

Complete control over exports of wheat and certain other grains is vested in a Wheat Board. Exports, particularly of grains, are assisted by the Government through availability of credit to foreign buyers. Subsidy payments have been made on exports of some surplus agricultural products, primarily in the dairy sector; in recent years, all exports

of dairy products have been subsidized except those consigned to the United States.

European Community.--The Common Agricultural Policy (CAP) of the Community generally features support prices higher than world price levels, without direct production controls. The high guaranteed prices (intervention prices) encourage uneconomic production and tend to restrain consumption.

The combination of favorable producer prices and absence of direct production controls has resulted in surplus supplies of many commodities subject to CAP regulations. To move these surpluses into foreign markets, the European Community provides export subsidies 1/ to permit sales at competitive prices in world markets.

The effect of the CAP on international agricultural trade has been most evident in grains, dairy products, and sugar--commodity areas in which the largest surpluses have been generated by EC policies. By the early 1970's, the EC was supplying more of its wheat needs than at the beginning of the 1960's, and aided by export subsidies it has become an aggressive exporter of wheat. The EC has continued to import wheat, but imports consist mainly of certain types not grown locally in sufficient supply which are required either for specialized uses or for blending with the locally produced soft wheat to produce satisfactory flour. Surpluses of wheat have led to its increased use for animal feed, with

---

1/ Until 1971, EC agricultural support (including export subsidies) was financed separately from the rest of the Community's budget, through the European Agricultural Guidance and Guarantee Fund. The fund was financed in part through variable levy revenues. Under an integrated system, begun in 1971, the Fund is no longer financed separately. (See section on variable levies in chapter VII).

subsidies paid to encourage use of feed wheat within the Community and to facilitate its exportation. Imports of feed grains into the Community have been lower in recent years than in the mid-1960's, as EC production has expanded and more wheat has become available for feeding. This policy not only reduced potential U.S. feed grain exports to the Community, but also meant that heavily subsidized wheat (and barley) exports from the Community competed in third country markets with products of the United States and other major exporters.

Higher prices for milk under the CAP have provided an incentive to increase production and also to market a larger share of milk output rather than consume it on the farm as food or feed. Surplus dairy products acquired under the support program have been disposed of in several ways, including subsidized exportation; expenditures for dairy export subsidies in the 1969-70 marketing year totaled the equivalent of more than \$500 million, compared with only \$18 million in 1964-65.

The CAP for sugar significantly stimulated production and resulted in substantial surpluses during the first years of operation following its full implementation in mid-1968. Surpluses have been used as livestock feed or by the chemical industry or have been exported to nonmember countries under subsidy.

Since the institution of a regulation for poultry and eggs in 1962, the European Community has become more than self-sufficient in these commodities and has resorted to subsidies to export the surpluses. To combat this competition, the United States has subsidized poultry exports to some of its traditional markets, including Switzerland and Austria.

The United States was compelled to use export subsidies also on lard sold to the United Kingdom to meet the subsidized competition of the Community.

The CAP for tobacco, which became effective in July 1970, has not been in effect long enough to evaluate its effects, but several features appear to have potentially adverse implications for U.S. tobacco exports to the Community, which has been an important market. These features include guaranteed high prices to producers without accompanying automatic production controls and a substantial buyer's premium (subsidy) to induce purchase of Community tobacco.

Japan.--To encourage food production, Japan--the most important single export market for U.S. agricultural products--has granted extensive subsidies to agriculture and has exercised a high degree of control over agricultural imports. Still, imports of agricultural products have increased markedly and make up more than a fifth of the nation's total imports. Support prices for wheat, barley, and rice have been equivalent to several times world prices. High support for rice has served to increase production substantially, resulting in a large surplus in recent years and reducing imports from the United States to negligible quantities. Exports and disposal of rice in domestic feed markets have been made at subsidized prices and rice acreage has been reduced, in an effort to cut down surplus stocks. Production of wheat and feed grains has been declining, however, and imports provide by far, the larger share of increased consumption requirements.

United Kingdom.--In the United Kingdom, a deficiency payment scheme was in wide use until 1971, when a shift was started to a minimum import

price system using variable levies on imports. In part, this change was made to harmonize the United Kingdom's agricultural support system with that of the European Community, in light of the prospective entry of the United Kingdom into the Community. The deficiency payment system had permitted prices to be determined by market forces; farmers were compensated for any difference between guaranteed prices and prices realized on the market. The United Kingdom's policy of encouraging feed grain production, particularly of barley, has adversely affected U.S. corn exports.

United States.--As the United States is a principal exporter and importer of agricultural commodities, its programs and policies have far-reaching effects on world trade in agricultural commodities. Many of the U.S. policies bearing on its foreign agricultural trade have their origin in domestic agricultural policy, and principally the stabilization of prices of specified farm commodities to protect farm income. Price-support programs are mandatory by law for most of the agricultural commodities supported by the U.S. Government, and include such major export commodities as wheat, corn, cotton, rice, tobacco, and grain sorghum; a mandatory price-support program is also in effect for milk. Price-support programs can also be established at the discretion of the Secretary of Agriculture, and one such nonmandatory program is in effect for soybeans. Price support for the eligible commodities is achieved through Government loans, purchases, and payments to producers. For many commodities under price support, production adjustment programs are used to balance supplies with needs and thus to prevent the accumulation of burdensome surpluses.

In addition to programs and policies indirectly affecting its agricultural foreign trade, the United States maintains measures that directly encourage its agricultural exports. The Agricultural Trade Development and Assistance Act (Public Law 480, enacted in 1954 and extended periodically since) authorized (1) sales of U.S. farm products in exchange for local currencies and long-term dollar and convertible foreign-currency credits, (2) donations and disaster relief, and (3) barter or exchange of agricultural commodities for strategic or other materials to meet U.S. needs. A 1966 amendment to the act required the progressive transition from foreign inconvertible currency sales to dollar credit sales or convertible local currency credit sales, to be completed by the end of 1971. From inception of Public Law 480 programs in July 1954 through December 1971, U.S. exports of agricultural commodities under Public Law 480 totaled \$20.6 billion, 22 percent of total U.S. agricultural exports during that period.

Under Agency for International Development (AID) and predecessor programs to assist the economic development of needy countries (also a declared long-term objective of Public Law 480), the United States exported \$2.3 billion worth of agricultural products in the period from July 1954 to December 1971, which was 2 percent of aggregate U.S. agricultural exports during these years. 1/

To enable certain agricultural commodities whose support prices are above world market levels to compete in foreign markets, the United States has maintained export payment programs, under which exporters

---

1/ Although a significant amount of exports funded by AID are agricultural products, the substantial majority are industrial products.

are compensated for the difference between the domestic price and the lower world price. Sales have also been made to exporters from Government-owned inventories at prices competitive in world markets. In recent years, such programs have assisted approximately half of the exports made under Public Law 480 and AID programs, and about a fifth of the commercial exports (those outside Government programs). U.S. Government expenditures for export payment assistance have declined sharply in recent years with the reduction of support prices for several major export crops (wheat, feed grains, and cotton) to or nearly to world price levels.

Credits and credit guarantee programs, administered by the Commodity Credit Corporation (CCC) and the Export-Import Bank, have also assisted U.S. agricultural exports.

If the principal U.S. Government programs assisting agricultural exports are considered on a combined basis, about 40 percent of aggregate U.S. agricultural exports from mid-1954 through 1971 were made under such programs.

#### Complaints against subsidies

Subsidies and other aids, including those mentioned in the foregoing pages, were the subject of a large number of complaints submitted to the Tariff Commission. Eighty percent of the total number dealt with aids provided by governments of the developed countries. Complaints against the six original member states of the European Community accounted

for 27 percent of the total, Japan for 20 percent, EFTA countries for 17 percent, and the United States for about 4 percent. Products involved in the complaints were found in 14 of the 23 industrial sectors and all of the agricultural sectors. The industrial sectors most frequently involved were nonelectrical machinery, electrical machinery, transport equipment, photographic and cinematographic supplies, and sound recording and reproduction apparatus.

### Discriminatory State Trading

State trading is defined here as the buying or selling by state enterprises, or by private enterprises upon which the state has conferred some exclusive privilege, of products or services destined for consumption by the public. State trading includes the trading activities of nationalized and government-owned industries, but it does not include the purchase of goods or services by governments for their own use and not for resale. A significant part of world trade is conducted under state trading conditions. State trading is commonly considered to be a phenomenon only in the centrally planned economies, since all or virtually all trade of the Communist-bloc countries is conducted by state agencies. However, most governments in market economy countries engage to some extent in state trading activities.

State trading is an integral part of the centrally planned economy characteristic of communist countries, where a state trading organization controls the monopoly of importing and exporting for each category of goods, with each trading monopoly being distinct from the state enterprises that produce goods for export and that seek to have goods imported. This separation has prevented most foreign traders from having direct contact with producers or final users.

Other problems exist for foreign businessmen in the total state trading of the communist countries. Some countries are given a preference by the state trading organization under bilateral trading agreements with communist countries; preferences are also frequently given to suppliers from other communist countries. Business prospects are hard to gauge where the arbitrary

decision of the government concerning cost and price criteria provide no basis for a judgment as to needs or supplies. The communist state trading monopolies have sometimes insisted on tied transactions and compensatory deals requiring the foreign company to engage in unrelated counter purchase commitments as a condition of placing their order. Also foreign firms generally are refused permission from communist trading monopolies to establish representative offices, hire local help and other facilities. Collection of royalties and the protection of trademarks and copyrights are often unreliable, thus discouraging some businessmen. Finally, the inapplicability of the GATT basic rules as regards trade with the totally state trading communist nations has been found to be very troublesome.

In market economy countries, state trading usually is conducted by special agencies operated for a specific purpose. The agencies may be organized as branches of government or as public or private corporations. They frequently may hold a monopoly for the buying or selling of a particular product or group of products.

In market economy countries, state monopolies in selected products traditionally were instituted to raise revenue, or in some instances to regulate the supply or price of staple commodities, such as grains, which are important to the general welfare of the nation. State monopolies have sometimes also been used for social control. Traditional product areas for state monopolies of the above type have been salt, matches, tobacco, alcohol, and (less frequently) certain staple foodstuffs.

During the past few decades, state trading in market economy countries has been given a tremendous impetus especially by two factors: The increase in national economic planning in both developed and developing countries, and the persistent foreign exchange shortage, particularly in developing nations dependent upon the export of one or a few primary products. In the first case, state trading in selected important commodities has been the device for integrating imports and exports into the plan for the domestic economy. <sup>1/</sup> State trading, of course, is also the unavoidable accompaniment of the nationalization of an industry. In the second case, state trading has been a device by which countries have sought to husband scarce foreign exchange, maximize the return upon sales of domestic output abroad, and minimize the cost of imports. In addition to these two major forces, national defense considerations have led some governments to monopolize trade of their countries in certain items.

The significant difference between trade conducted by the state and trade conducted by private business is that the former frequently is strongly influenced or determined by noncommercial considerations, whereas private business must normally operate on commercial principles or soon cease to operate at all.

It is here that the trade barrier aspect of state trading emerges. The volume and direction of state trade may be determined chiefly in terms of political or social goals and differ greatly from the situation which would prevail if ruled by purely commercial considerations. Some aspects of this problem have been described by one author in the following manner:

---

<sup>1/</sup> The economic plan, for example, may necessitate selling imports on the domestic market at lower than world prices, or exports on the world market at lower than domestic prices. One way of accomplishing this is through a state monopoly of trade in a product.

... the government can create an enterprise that is granted a monopoly over a certain product in the domestic market. With all other enterprises forbidden to buy this product, this monopoly enterprise is in a position completely to control the imports of that product simply by its decision to buy. If the enterprise decides to prevent imports, it simply makes an enterprise decision to obtain its entire supply of the product from domestic sources. No tariff or quota is needed. The decision is a "discretionary" business decision and hard to challenge. Even without limiting its purchases entirely to domestic supplies, if the object of the enterprise is other than to maximize profits, its buying decisions may be "uneconomic," e.g., products may be bought domestically for a higher price than imported products would cost. If the government controls the enterprise, enterprise decisions may be based on domestic political pressures or even international political policies, such as a decision to buy products only from a specific country in return for international military or political support by that country. <sup>1/</sup>

Thus it is seen that state monopolies may also serve the objective of protecting domestic producers against foreign competition. When the state handles the imports of a product it may discriminate against foreign suppliers simply by a decision not to buy or by charging an unduly high markup on the imported product when it is resold in the domestic market. Such a markup would have the same effect as a tariff. State import monopolies may also discriminate against certain foreign suppliers only, while favoring others.

Diverse objectives have been found in state export monopolies. One has been to facilitate exports on the world market when domestic prices are above the world level. Another has been to control exports with a view to maintaining a specified world price level. Still a third has been to prevent the exportation of a product needed by the domestic industry.

---

### GATT provisions on state trading

The drafters of the General Agreement on Tariffs and Trade recognized that governments could protect their domestic industries or artificially promote their exports to the detriment of foreign producers simply by state trading practices and without resorting to such devices as quotas or tariffs which the agreement was trying to regulate. With the hope of avoiding this, provisions on state trading were included in the agreement. Article XVII reads in part as follows:

1. (a) Each contracting party undertakes that if it establishes or maintains a State enterprise, wherever located, or grants to any enterprise, formally or in effect, exclusive or special privileges, such enterprise shall, in its purchases or sales involving either imports or exports, act in a manner consistent with the general principles of non-discriminatory treatment prescribed in this Agreement for governmental measures affecting imports or exports by private traders.

(b) The provisions of sub-paragraph (a) of this paragraph shall be understood to require that such enterprises shall, having due regard to the other provisions of this Agreement, make any such purchases or sales solely in accordance with commercial considerations, including price, quality, availability, marketability, transportation and other conditions of purchase or sale, and shall afford the enterprises of the other contracting parties adequate opportunity in accordance with customary business practice, to compete for participation in such purchase or sales. 1/

---

1/ Paragraph 2 of article XVII provides, however, that the provisions of the article shall not apply to imports of products destined for consumption in governmental use, i.e. to government procurement. As mentioned in the section on government procurement, GATT permits discriminatory practices in government procurement.

One interpretation of Article XVII that has been put forward is that nondiscriminatory treatment and the use of commercial considerations in purchases and sales of state trading agencies is meant to apply only to discrimination among foreign suppliers and permits a state enterprise to discriminate in favor of domestic suppliers. By this interpretation, the state enterprise is obligated only to grant most-favored-nation treatment (and not national treatment) to competitive suppliers from other countries. See John H. Jackson, World Trade and the Law of GATT, Bobbs Merrill Co., Inc. (New York: 1969), pp. 346,347.

In article II-4, the GATT provides that import monopolies shall not operate so as to afford protection in excess of that afforded by tariffs. To prevent such excess protection, article XVII-4 provides that state trading enterprises have to disclose their import markups at request of a contracting party. This paragraph generally provides that the Contracting Parties may request information on the whole operation of state trading enterprises maintained by any of them.

#### Complaints against state trading practices

In the present investigation of trade barriers, 138 complaints were submitted to the Tariff Commission concerning state trading and discriminatory practices by government monopolies. Developed market economy countries were the object of 54 percent of the complaints; developing nations, 43 percent; and Communist countries, 3 percent. Virtually every developed market economy country and 39 developing nations were named in the complaints, which involved products in 17 of the 23 industrial product sectors and in all of the 9 agricultural product sectors.

The importance of state trading in many products, and its implications for trade in those products, is frequently overlooked. An outstanding example is found in iron and steel. In several countries throughout the world, a domestic steel industry is regarded as essential to the national economy; and in developing countries, particularly, a steel industry has become symbolic of industrial progress. In response to such concepts, governments in many countries have become closely involved in the affairs of their steel industries. In many instances, steel industries are 100

percent owned by the national government; in other cases they are subject to such extensive governmental control and guidance that they in effect operate in the manner of a nationalized enterprise. Nineteen percent of the total steel producing capability in market economy countries is directly owned either wholly or to a substantial extent by the national government. This direct government ownership is found in the steel industries of 11 developed countries and over 18 developing nations. This extensive government involvement is regarded by representatives of the U.S. steel industry as the major nontariff barrier distorting the flow of steel trade throughout the world. These complainants feel that the involvement by foreign governments in their steel industries places U.S. steel producers at a competitive disadvantage in foreign markets and in the U.S. market "because U.S. steel producers are competing against government-dominated producers abroad whose commercial policies are dictated by national interest rather than by normal economic considerations."

Another very prevalent example is government ownership of radio and television broadcasting stations. U.S. producers of radio and TV programs feel their participation in foreign markets is severely limited by government decisions on the airing of foreign program materials.

In the following pages, state trading by major developed countries in a few other selected products is briefly described. These examples appear for illustrative purposes only and should be considered only a partial inventory of the instances of state trading activities. They are not indicative of the extent of state trading in the countries included in the list or the range of products covered. All of the examples, however, were among the complaints submitted in the Commission's investigation.

## Canada

Wheat, oats and barley.--The Canadian Government maintains a trade monopoly of wheat, oats and barley which is administered by the Canadian Wheat Board. In carrying out this function, the Board undertakes to market these grains on behalf of the producers in domestic and export markets. The Board exports either through its agents or on the basis of a direct agreement with foreign governments, and it is authorized to develop special promotional activities overseas.

Alcoholic beverages.--The provincial Liquor Boards have a monopoly on the sale of alcoholic beverages. Especially three of these Boards, those of British Columbia, Ontario, and Quebec, have been criticized for discriminatory practices against foreign alcoholic beverages. In recent years the U.S. Government has frequently voiced complaints about the fact that the Liquor Boards carry only a restricted number of U.S. brands and sizes, and that in some cases the markups are higher on foreign than on Canadian brands. Most of the whisky imported by Canada from the United States is bulk whisky, transferred from the U.S. distilleries of Canadian companies to Canadian distilleries of the same companies.

Several provinces of Canada effectively exclude U.S. beer from their markets through a variety of devices. For example, foreign brands of beer can be distributed by State Liquor Stores only, whereas domestically brewed brands are permitted normal commercial distribution.

## Federal Republic of Germany

Ethyl alcohol.--Ethyl alcohol and certain spirits are subject to the import monopoly of the Federal Monopoly Administration. This organization

has the exclusive right of importing unprocessed alcohol, and imports it only when needed for supplementing insufficient domestic production. The administration generally authorizes private traders to import spirits. Exports by private traders are not subject to any restrictions.

#### France

Tobacco and tobacco products.--Production and trade in tobacco and related products are a state monopoly operated by SEITA (Société d' Exploitation Industrielle des Tabacs et des Allumettes). SEITA establishes a national quota of land under tobacco cultivation, allocates it by region, and purchases the whole crop of home-grown tobacco at annually fixed prices.

SEITA also exercises monopoly over imports and exports. Prior to 1970 it limited materially the number of manufactured tobacco brands admitted to the French market, restricted the publicity actions relating to foreign products in the home market, and specified a minimum sales volume for exporters. Since Jan. 1, 1970, these restrictions have been liberalized; nonetheless, it appears that controls are still significant on the sales level.

Newsprint.--Imports and prices are controlled by a cooperative (SPPP-Société Professionnelle de Papiers de Presse) which is supervised by the state. In a convention signed in 1961 between the state and the SPPP, the latter assumed various obligations which included that a certain percentage of the press requirements for newsprint, based on prevailing domestic production-capacity, be purchased from French sources.

Petroleum products.--Importation, refining and distribution of petroleum and products are a state monopoly with importers and distributors

licensed by the state. The system was criticized as giving French firms a larger share of the domestic market than would accrue to them if competition were free.

Coal.--Imports are a state monopoly. The Government decides how much coal will be purchased outside the Community and where it will be purchased. These decisions of the Government are then executed by the ATIC (Association Technique de l'Importation Charbonnière), a group of the principal coal importers in France. Decisions regarding coal imports from other Community countries are made directly by the ATIC.

Until a few years ago the competitive position of the United States (and other non-Community countries) was significantly undermined in the French market by the pricing system the French Government applied to imported coal, whereby the Government established the price of imported coal independently of its actual purchase price and above the price level of subsidized domestic coal. Moreover, the Government discriminated against the United States in favor of other third country suppliers. In the past three or four years, increased French demand for both U.S. steam coal and bituminous coal induced the French Government to liberalize its pricing practices of imported coal, and conclude long-term bilateral contracts with the United States.

Potash fertilizer.--Imports of potash and nitrogenous fertilizer is controlled by the French state monopoly SCPA (Société Commercial des Potasses et de l'Azote). U.S. exports of potash fertilizer to France appear to be discriminated against by this monopoly in favor of domestic products, or those originating in countries of the European Community.

## Italy

Tobacco and related products.--Production and distribution of unmanufactured and manufactured tobacco are a state monopoly. Manufacture is handled directly by the Administration of the State Monopolies, with growing and distribution handled partly also by private concessionaires under the supervision of the Administration.

Both unmanufactured and manufactured tobacco are imported by the Monopoly Administration. According to some adversely affected countries, the Italian tobacco monopoly restricts imports not only quantitatively, but also by maintaining the sales prices of imported brands significantly above those of Italian brands.

Exports are handled by the Monopoly Administration, or by private concessionaires. Manufactured tobacco is exported exclusively by the Administration.

The trade restricting effect of the Italian tobacco monopoly appears to be significant for U.S. exports to Italy.

Imports of cigarette paper, lighter flints and matches are also a state monopoly.

Steel.--Over half of Italian raw steel production is under direct government ownership and, thus, this proportion is state traded.

## Japan

Tobacco.--Production, distribution, and imports are a state monopoly exercised by the Japanese Monopoly Corporation. The corporation determines the acreage and type of cultivation for private growers, and purchases all tobacco from them at prices fixed annually. Leaf tobacco is imported chiefly as aroma and taste material to be mixed with domestic leaf tobacco.

The Monopoly handles virtually all imports. (In rare instances permission may be granted for private imports at extremely high rates of duty).

Imports by the Monopoly Corporation are duty-free.

The restrictive impact of the Japanese tobacco monopoly on U.S. exports to Japan, both of tobacco and cigarettes, appears significant. U.S. producers reporting to the Commission on this barrier estimated that its removal would probably increase their exports by about a third of the present value.

Alcohol with 90 percent or more alcoholic content.--Production, sale, and imports are a state monopoly exercised by the Ministry of International Trade and Industry (MITI). Production takes place at State-operated and private companies. The government purchases all domestically produced alcohol at predetermined prices. Imports take place only when domestic production falls short of demand.

Rice, wheat and barley.--The government supports the prices of these farm commodities and holds a monopoly of exports and imports. Decisions on imports are formulated on the basis of administrative judgment rather than free market competition, with a consequent restrictive effect on U.S. exports to Japan.

Japanese imports of rice--both total imports and those from the United States--dwindled to negligible amounts in the second half of the 1960's owing to domestic overproduction engendered by the price support program. On the other hand, Japanese imports of wheat--both total and those from the United States--increased significantly, to make up for a decline in domestic production which took place despite the price support programs.

Imports from the United States of barley dwindled to zero by 1970, due in part to competition from other foreign suppliers.

Dairy products.--Butter and several types of processed milk are subject to state trading. The Livestock Industry Promotion Corporation or traders entrusted by it are the sole importers of these products. The Corporation imports only as necessary to keep the prices of these dairy products within a specific range of the guaranteed price.

#### United Kingdom

Coal.--In the past decade the United Kingdom National Coal Board has handled all imports of coal on any significant scale. The board was established in 1946 when the coal industry was nationalized. Importation of coal into the United Kingdom, however, was prevented by the fact that the United Kingdom Government did not authorize coal imports, except in a special emergency. This embargo, which was in effect from 1958 through 1970, had a significant trade restricting impact on U.S. coal exports to the United Kingdom.

Steel.--The British Steel Corporation is probably the prime Free World example of a nationalized steel industry. Thus, the United Kingdom operates a state trading activity with regard to steel products.

#### United States

At the federal level in the United States there are relatively few areas of state trading. The Federal Government has engaged in state trading

principally in connection with disposal abroad of surplus agricultural commodities and the purchase and sale of strategic raw materials for stockpiling. However, many of these sales have been non-commercial under Public Law 480 and AID programs. Fissionable materials and helium are also state traded by the Federal Government.

On the state level, governments control the distribution of distilled alcoholic beverages in 18 states. Wine is similarly controlled in 14 of these states and beer in 5. The state determines the brands of beverages to be carried, and the prices to be charged. According to complaints submitted to the Commission, the number of brands available to the public in state stores are generally fewer than retail outlets in non-monopoly states. This administrative practice was felt to limit the sale of both domestic and foreign goods. About a fourth of the distilled beverage consumption in the United States occurs in states having a monopoly on alcoholic beverages.

## Discriminatory Government Procurement

Government purchasing from private industry has been described as the world's biggest business. The U.S. Government every year buys \$55 billion to \$60 billion worth of goods including expenditures for military goods. In the United Kingdom and the United States, government purchases account for as much as 21 percent of the gross national product; in West Germany the portion is 16 percent; in Canada, 15 percent. The city of New York purchases \$170 million in goods and services each year. Governments are the largest single purchasers of goods and services in most countries of the world, and the importance of governments and quasi-official bodies and government-affiliated organizations as purchasers increases daily. Obviously, their procurement policies are of major importance both to domestic economies and to international trade.

Governments usually exhibit some concern to assure that all or most of their domestic producers are given the opportunity to share in supplying public purchases. The same concern, however, generally has not been extended to suppliers of imports. Most governments favor domestic suppliers over foreign sources in their procurement of goods.

### The principal forms of discrimination in procurement

There is a multiplicity of ways of exercising discrimination among suppliers in government procurement. Preferences accorded domestic suppliers may be incorporated in published laws and regulations, but in most countries they are effected informally through a

variety of practices and procedures. Under the so-called Buy-American Act of 1933, the Federal Government of the United States openly favors domestic suppliers in its procurement. On the other hand, in Europe and Japan, laws and published regulations explicitly providing for discriminatory practices are rare; nonetheless, discrimination against foreign suppliers exists.

It must be recognized that an inherent psychological bias in favor of dealing with fellow nationals plays a role in discriminatory procurement. Aside from this, however, one of the main practices that inhibits foreign participation in government procurement is insufficient publicity in the solicitation of bids and in the disclosure of the criteria on the basis of which contracts are to be awarded. The principal techniques used in the solicitation of bids for government purchases are "public," "selective," and "single" tender. Under public tender, invitations to bid are publicized widely; under selective tender, invitations are limited to selected suppliers; under single tender, the purchasing authority contacts one supplier only. Public tender is the most important tendering procedure for nondefense purchases in the United States and also in Belgium and Luxembourg. But most trading partners of the United States, such as Japan, the United Kingdom and most European Community countries use predominantly selective and single tender. It is generally recognized that these tendering procedures lend themselves to discriminatory practices more readily than public tendering.

In evaluating bids, governments generally use commercial criteria such as price, quality, and delivery terms. Most procurement authorities, however, have some freedom in awarding contracts to introduce considerations other than commercial, which may include a price preference given to domestic suppliers. Secrecy surrounding the circumstances of awarding contracts often protects such discriminatory practices from disclosure.

Foreign suppliers can also be suppressed through specific conditions of bidding which put them at a disadvantage, such as certain administrative requirements or allowing inadequate time for the submission of bids. Moreover, purchasing authorities may specify technical requirements in advance collaboration with domestic suppliers, thereby limiting from the outset the possible competitiveness of the foreign bidder. In some countries only resident firms may undertake government contracts of certain types; some countries require that a bidder have a mailing address or a bank account where the goods are to be delivered.

Discrimination in government procurement is not always directed against all foreign suppliers equally. The government of the United Kingdom, for example, apparently has preferred among foreign suppliers, Commonwealth countries and members of the European Free Trade Association (EFTA). Neither do preferential practices always extend to all domestic suppliers; in certain countries, for example, preferential consideration in procurement may be given only to producers in a certain geographic region (such as a depressed area), or to a specific group of domestic suppliers.

(e.g., medium-sized firms; institutions, such as prisons, etc.).

Some countries may give preference to domestic suppliers in the procurement of specific commodities only, while treating foreign and domestic suppliers equally in the procurement of other goods. Typical commodities to which preferential procurement from domestic sources is most frequently applied are military goods (for national security reasons) and products of high technology (to promote domestic production capacity). In some countries, discrimination against foreign suppliers may take place especially for large procurements, with contracts awarded to a foreign supplier exceeding a predetermined value becoming subject to special controls.

#### International concern over discriminatory procurement practices

Until fairly recently, it seems, it would have been somewhat unconventional to expect a government to do otherwise than favor its own citizens when making purchases from the public purse.

Governments have only belatedly begun to show much concern over the discrimination which their industries encounter when seeking to participate in public procurement by other governments. Indeed, discrimination in the purchase of products by a government for its own use is expressly permitted in the General Agreement on Tariffs and Trade and is not a violation of the so-called national treatment provisions of that agreement. For practical purposes, the trade rules of the GATT can be considered inapplicable to government procurement.

It was not until several years after World War II that governments began to show some apprehension over the exclusion of their producers from the public sector of the market in foreign countries. This apprehension was sparked by a beginning realization that even in market economy countries the public sector was taking a surprisingly large and increasing percentage of world purchases. Also, some governments were spurred by the discontent of certain domestic producers who found themselves faced with intense foreign competition in their own market, but were excluded from important foreign markets because consumption of their product happened to fall predominantly in the public sector in those countries.

Many nations do not reveal the specific conditions of their preference policies. Thus, because the U.S. buy-American law specifically requires preferential treatment of domestic suppliers, and published U.S. regulations spell out exactly the degree of discrimination to be applied against foreign bidders (generally 6, 12, or 50 percent of their bid, depending upon the circumstances), the United States was an obvious target for criticism from other countries.

#### OECD work on government purchasing

Largely because of the complaints against the United States, and the unsatisfactory responses from other countries to U.S. countercomplaints, in the early 1960's a series of formal discussions of procurement practices began in the OECD and has continued intermittently to the present time. This exercise eventually led to an effort to develop an international code of conduct covering

government procurement, the chief purpose of which would be to reduce discrimination against foreign suppliers. Substantial progress has been made in the drafting of such a code, but major difficulties are still unresolved.

In the course of discussions in the OECD, the United States has called principally for more open procedures in the purchasing practices of foreign governments in order to prevent concealed discriminatory practices. The policy of U.S. trading partners, on the other hand, has been to resist changes in their existing procedures, while calling for the elimination of the buy-American preferences. The United States rejected the first draft of common guidelines for procurement prepared in the OECD on the basis that it did not provide for a reciprocity of obligations on behalf of U.S. trading partners. Whereas the United States was asked under the terms of the guidelines to undertake the elimination of the buy-American margins of preference accorded to U.S. products, there were no guarantees in the guidelines that other countries having only a few openly stated preferences would be compelled to abolish their practices of de facto discrimination.

Subsequently, the United States proposed that the drafting and discussion of guidelines should first focus on the government procurement experience of one industry, and particularly the heavy electrical equipment sector where de facto discrimination was prevalent in many countries and provided a good example of inequality in market access. The United States maintained that a "sectoral approach"

would afford the OECD a better chance to develop meaningful guidelines. Attention could thereafter be extended to other sectors, leading eventually to a comprehensive international code. In 1969, the United States submitted a new proposal for guidelines oriented to the heavy electrical equipment sector, and strongly emphasized the need for publicity on the availability of contracts, and disclosure of information on the winning bids. However, U.S. trading partners, particularly the European Community and Japan, continued to resist the new U.S. proposals, and the "sectoral approach" in general, and consequently, work was continued on general overall guidelines.

It would appear that if meaningful guidelines are to be agreed upon, important compromises or adjustments will be required on the part of all parties.

#### Regional harmonization of procurement practices

On a less extensive international scale than in the OECD, other developments have taken place which give some insight into the significance of procurement practices for international trade. Regional trading groups, such as the European Community and the European Free Trade Association, began to focus on the fact that national preferences in the government purchases of the member states of those organizations were actually subverting the achievement of the goal for which the organizations were created.

In the European Community, for example, in an examination of several sectors important to the national economies and in which government purchases were large (in some cases predominant), it was found that intra-EC trade was extraordinarily low. For example, in telecommunications equipment, which goes mainly to public purchasers, intra-Community shipments supplied only about 3.5 percent of Community consumption. In the railway equipment sector, where purchases are made almost exclusively by governments, intra-Community shipments supplied less than 8 percent of consumption of most items, while very similar products distributed to the private sector showed percentages of consumption for intra-Community shipments as high as 34 percent. In France, Germany, and Italy, imports from any source supplied only 5 percent of the technical equipment for airports, which consists exclusively of government purchases. In France, in 1968, companies in other EC countries received only 0.51 percent of the public contract awards.

In order to circumvent this problem, in 1966 the EC Commission drafted a directive embodying the following principles to govern the award of public works contracts within the Community: (1) All major public works projects should be advertised; (2) all EC firms having the technical and financial capability should be entitled to submit bids; (3) the most advantageous bid should be selected, and the choice should not be dependent upon nationality or other national criteria; and (4) technical standards should not be applied if they

would have the effect of national discrimination. The draft was passed by the EC Council in 1971, to become effective in July 1972. 1/

In March 1971, a similar directive on public procurement was submitted to the EC Council, where it is still under consideration. The directive would eliminate discrimination in public procurement among products of member states, and by implication, also eliminate discrimination against third country products entered into the Community and third country producers inscribed on the professional register of a member state (e.g., U.S. subsidiaries in Europe). The 1971 draft excluded transportation, water and public power from its provisions. It is expected that the draft may be adopted by the end of 1974, but this is uncertain. Delaying adoption of the draft is a lack of agreement on other proposals which have been made in the Community on the selective and discriminatory use of government purchasing to promote industrial development. 2/ There appears to be a likelihood that when the directive finally is adopted it will be more restrictive in regard to products of third countries than is the present draft. Meanwhile, the EC Commission is continuing efforts to liberalize public procurement among the members of the Community.

---

1/ The French Minister of Public Works and Housing has estimated that as a result of the introduction of intra-EC competition through changing contract awarding procedures, the cost of public works projects could be cut by up to 20 percent.

2/ Development of the aircraft, electrical, data processing, railway equipment, and telecommunications industries in this manner has been proposed.

Countries of the European Free Trade Association also have agreed to a set of rules to be observed in purchases by their governments, nationalized industries, and semipublic enterprises of products eligible for "area tariff treatment" under the EFTA agreement.

#### The trade impact of discriminatory procurement

Thus far, no really successful measure has been made of the actual extent of discriminatory government procurement practices and the degree to which they may distort trade patterns from those which would exist if the discrimination were absent. One reason this has not been done is the fact that only extremely rudimentary and fragmentary data are available to give some indication of the amount of imported products purchased by governments in comparison with their purchases of domestic products.

In the absence of the necessary data, the nature and magnitude of discrimination in government procurement by various nations can be assessed only in very general terms. Using such data as are available, one approach to the problem has been to attempt a comparison of the ratio of imports to domestic products in consumption in the private sector of an economy with the similar ratio in the public sector. Assuming that the ratio for governmental imports would not differ significantly, in an unrestricted situation, from the ratio for private sector imports, a hypothetical level of government imports is calculated. The absolute difference between this hypothetical

figure and actual governmental imports could be taken as some measure of the trade distortion resulting from discriminatory procurement practices. <sup>1/</sup>

#### Complaints against government procurement practices

In the current investigation of trade barriers, 75 complaints were submitted to the Tariff Commission against discrimination encountered in government procurement practices in 26 countries. All of the major developed market-economy countries were named in the complaints and 13 developing nations. Eighty percent of the complaints involved the developed countries.

Almost one-third of the complaints against the developed countries involved procurement practices in member states of the European Community. Twenty-five percent of the complaints were against the United States, 20 percent were against members of the European Free Trade Association (as it existed prior to January 1973), 10 percent were against Japan, and 5 percent were against Canada.

#### Examples of discriminatory situations in selected countries

Procurement laws and regulations, particularly at the national government level, tend to be highly technical and complex (a factor which in itself is said to constitute an obstacle to foreign suppliers), and it would be impossible in this report to specify the numerous provisions in those regulations and the procedures followed under them which foreign suppliers may consider discriminatory.

---

<sup>1/</sup> See Robert E. Baldwin, Nontariff Distortions of International Trade, 1970, pp. 71-74.

Illustrative of the technical nature of these regulations is the fact that the OECD had to draw upon the services of specialized experts in procurement procedures of each country when it undertook the 1966 compilation of procedures in government purchasing in Europe, North America, and Japan.

In the following paragraphs, for a few of the major countries, a limited number of selected situations are described which are either explicitly or implicitly prejudicial to foreign suppliers of government purchases in those countries. The examples, which are intended to be illustrative only, are drawn chiefly from the 1966 OECD summary of purchasing regulations and from submissions to the GATT.

Benelux countries.--The Benelux Customs Union agreement provides for equal treatment of all government suppliers in the three member countries, implying discrimination against suppliers of third countries. In Belgium, in certain instances, domestic (i.e., Benelux) suppliers may be given preference if the price differential in favor of the foreign supplier does not exceed certain limits (believed to be normally 10 percent). In Luxembourg, foreign bidders are required to hold a trading license, and licenses may be refused if such act does not interfere with existing international agreements. In the Netherlands, firms submitting bids on public works must have a Netherlands domicile, and in practice this means an actual engineering office, although this is not specifically required by Dutch law.

Canada.--No law or regulation in Canada imposes restrictions on Federal Government procurement from other countries, but the Canadian Minister of Supply has stated that the Department of Supplies and Services (D.S.S.) "buys from Canadian firms if practicable and only turns to other sources of supply when procurement from the Canadian sources is deemed to be uneconomical or impractical." Invitations to tender, which are issued to suppliers on central D.S.S. registers, are used for most nondefense materials and equipment. Being on the central register of the D.S.S. is probably not very helpful to a foreign supplier unless a Canadian representative familiar with Federal Government needs, regulations, and officials is also maintained. The Federal Government does not give a premium to Canadian suppliers, as such, but it will pay a premium of up to 10 percent on the Canadian content of the bid, regardless of the country of the supplier. In the Canadian provinces, in general, a premium of from 5 to 15 percent is given to provincial suppliers, and some provinces also give a slight preference to Canadian goods manufactured outside the province.

Federal Republic of Germany.--The general rule is that foreign bids should be treated as domestic ones, but de facto exceptions are preferences given to certain domestic groups such as refugees, victims of war, and firms or individuals located in economically depressed areas. To such privileged subjects, contracts are awarded if their bids do not exceed the most economical bid by more than 0.5 percent. Moreover, the Ministry of Defense places a certain proportion

(usually about 20 percent) of its contracts with "suitably qualified" medium-sized German firms. When deciding the award, duties are added to the foreign price of the bid.

West Germany practices "bilateral reciprocity" in its military purchases. The United States and Germany have over the past several years concluded a series of "offset" agreements in order to neutralize for the U.S. balance of payments a substantial portion of the costs of deploying U.S. military personnel in Germany. Under these agreements, West Germany has deposited with the U.S. Treasury special funds earmarked for German purchases of military goods and services from the U.S. Government and from private U.S. firms.

France.--Private or negotiated contracts which do not involve competitive bidding are used for over half of government procurement in France. In principle, foreign suppliers are treated as domestic suppliers, but in practice there are numerous exceptions. They relate sometimes to the procurement of specific types of products. For example, a certain part of governmental purchases of electronics products must come from domestic sources. This and other similar provisions serve to attain specific objectives of the French economic development plan. Other exceptions involve preferences given to specific groups of domestic suppliers, such as industrial and agricultural producers cooperatives. For public works and building contracts, administrative regulations frequently specify the use of French materials, tools and appliances. Foreign procurement seems to

be practically ruled out in public sectors such as railways, nuclear energy, and aircraft construction. Procurement of foreign aircraft is heavily restricted by the refusal of authorities to issue the necessary technical approval. Efforts to ensure maintenance services, supply of spare parts, etc., and the enforcement of the related technical regulations result in de facto discrimination against foreign suppliers in a number of other areas of government procurement.

Italy.--Government departments do not deal directly with foreign firms, only with firms that, although trading in foreign products, are legally established in Italy. However, current legislation does not forbid government departments to invite foreign suppliers to bid. Legislation exists, however, that accords preference to domestic suppliers located in certain regions; 30 percent of government purchasing is reserved by law to suppliers from Southern Italy and the Islands in order to promote the industrialization of those areas. Based on a decree by the Council of Ministers, a similar preference of 15 percent exists in favor of supplies produced by the blind. The Ministry of Defense buys foreign products only if domestic ones are not available as desired, particularly if the procurement serves exclusively military purposes.

Japan.--There is no legislative requirement in Japan specifying preferential treatment for domestic suppliers by the central government in its purchases, but de facto discrimination is very prevalent. Almost no goods and services are procured by the central government agencies by open or public bids. The great bulk of purchases are made by

selective tenders or private contracts, and in most cases bidders are informally contacted by procurement officials of the Ministry making the purchase and requested to submit estimates. No advance notice of purchase or bid is published, and the selection or designation of suppliers and bidders is solely in the hands of the procurement officials of the individual ministries.

A 1963 Cabinet order "encouraging the use of domestic products in order to utilize foreign currencies efficiently" provided for preferential treatment by the government for domestic sources of certain products which were to be specified by the Ministry of Finance. The products that later came under this provision included automobiles; office machines; construction, printing and agricultural machinery; aircraft; machine tools; and measuring instruments. In September 1972, the Ministry of Finance announced that these preferences would no longer be officially required for any products except computers and peripheral equipment.

United Kingdom.--Apart from certain general Treasury regulations, buying departments have full discretion to award contracts under any set of conditions they see fit. As a result many contracts are placed under bulk supply agreements, or through selective tender from a closed list of suppliers. Single tender is also widely used while open public tender is used only rarely. Departments normally give preference to bids from firms in areas of high unemployment, specified as development districts, provided that their prices, specifications, delivery, etc. are comparable.

Despite the absence of formal discriminatory provisions against foreign suppliers, specific areas of de facto discrimination exist. As far as government purchasing of computers is concerned, explicit guidelines direct officials to accord preference to domestic suppliers under prescribed circumstances. In the area of general procurement, the United Kingdom appears to favor certain groups of foreign suppliers. On the basis of a 1958 Commonwealth trade and economic conference, the United Kingdom was committed to seek out possible Commonwealth suppliers.

There is also potential discrimination against all foreign suppliers in the provision that requires all contracts involving £50,000 or more to be referred to the Treasury for review if it is contemplated that the contract will be awarded to a foreign firm. If there are no overriding balance-of-payments considerations and if there is a significant saving to be realized by letting the contract to a foreign supplier, the Treasury usually will not oppose awarding the contract outside the United Kingdom. If, however, the differential in favor of the foreign firm is very small (one or two percentage points), the Treasury will recommend that the contract be placed with a British firm.

Technical standards in certain purchases, such as electrical power and telephone equipment, applied ostensibly to assure adequate maintenance and spare parts services, also result in discrimination against foreign suppliers.

The procurement policies of nationalized industries are left almost entirely to their own judgment.

United States.--The Federal Government is required by the Buy-American Act of 1933 to favor domestic suppliers in government procurement. This law requires that U.S. government agencies purchase domestic products for use within the United States, except if (a) such products are not available domestically, (b) the cost of domestic supply would be unreasonable and (c) the purchase from domestic sources would be inconsistent with the public interest. Executive Order 10582 of 1954 establishes specific guidelines for implementing the Buy-American Act. It limits the preference margin to be accorded domestic products to 6 percent above the delivered cost of the lowest foreign bid (including duty). By a subsequent provision, this preference was further extended to 12 percent for small businesses and concerns in labor-surplus areas.

However, the Buy-American Act and its implementing order left a broad discretionary margin to officials responsible for procurement, authorizing them to disregard the specified price preference limitations on grounds of national interest and security. Accordingly, in 1962, the Department of Defense introduced in its purchases a 50 percent maximum preference for domestic products over the lowest foreign bid, exclusive of duties. The other federal agencies generally apply the 6 and 12 percent preference margins, in their procurement for use in the United States, but many have mandatory reviews by senior officers or committees for all contracts above a certain value before a final award is made.

Procurement for use abroad is not subject to the buy-American Act and agencies are free to set their own policies. Nonetheless, federal agencies apply a 50 percent preference for overseas procurement. In addition, the Defense Appropriation Act of 1954 includes a prohibition on the procurement by the Defense Department from foreign sources of any food, clothing and certain textile yarns (all with certain exceptions) for use in military establishments outside the United States. Under the Defense Appropriation Act of 1972, the Department of Defense is prohibited from purchasing material containing certain specialty metals manufactured abroad.

More than twenty states and several local governments also discriminate in their purchasing policies against foreign suppliers.

The United States has a considerable array of other laws and administrative provisions with buy-American elements in them. These involve preferences given to certain social groups as producers, such as the blind and prisoners. Moreover, special preferences are accorded to domestic suppliers of specific products, such as twine and jewel bearings.

### Miscellaneous Government Practices Which Impinge Upon Trade

In the Tariff Commission's present survey of trade barriers, several complaints were submitted concerning government policies or practices which directly affect trade but were not easily classifiable under any of the five principal headings for trade barriers used in this report. <sup>1/</sup> Although outside the realm of direct government participation in trade, they are perhaps more appropriate for inclusion in this chapter than in those dealing with the other categories of barriers. Accordingly, the more significant of these complaints are briefly listed below without extensive discussion.

#### General complaints involving several countries

1. Monetary policies of the major nations and international monetary problems have hindered normal development of trade, particularly in the past 5 years.
2. Government (and nongovernmental) "buy national" campaigns to promote greater use of domestically produced goods produce an uneconomic discrimination against imports.
3. The frequency of change in regulations applicable to trading activities is costly and retards trade.
4. Limitations or other controls on advertising prevent development of potential markets.

---

<sup>1/</sup> The five categories are: (1) Nontariff charges on imports, (2) quantitative restrictions and similar limitations on trade, (3) government participation in trade, (4) standards as technical barriers to trade, and (5) customs procedures and related administrative practices.

5. Government regulations and limitations on airline routes, flight frequencies, aircraft capacity, fares, and charter arrangements, in effect, indirectly limit sales of aircraft.
6. Difficulties in repossessing large purchase items, such as aircraft, on which the purchaser has defaulted payments is a hindrance to some international sales.

General complaints against the United States

1. U.S. firms are disadvantaged in competing overseas by the "extra-territorial" extension of U.S. antitrust laws.
2. The threat of legislative restrictions on U.S. imports hinders development of the U.S. market for foreign products.
3. Insufficient cooperation between business and government in foreign trade matters handicaps the U.S. businessman in his efforts to sell abroad.
4. Uncertainty as to the manner in which escape-clause provisions of the Trade Expansion Act of 1962 will be interpreted dampens efforts to fully develop import markets in the United States. Prolonged continuation of escape-clause relief has suppressed imports.
5. Uncertainties for trade arise from application of the provision of section 337 of the Tariff Act of 1930 dealing with unfair practices in import trade.

6. U.S. export sales have been delayed by difficulties in obtaining immigration clearance to bring foreign nationals to the United States for training in the use of U.S. produced equipment.

#### General complaints against other countries

In complaints against Japan, irrespective of the particular practice which was the main object of the complaint, there frequently was also mentioned as an important element affecting international competitiveness the very close relationship between the Japanese Government and Japanese business. Many U.S. businessmen felt this gave rise to frequent "administrative guidance" detrimental to imports into Japan and was also important in governmental assistance to Japanese exports.

Spain and some other developing countries regulate channels of distribution for some products to require that importers purchase directly from the original manufacturer rather than secondary distributors.

U.S. exporters to some Communist countries felt their sales were inhibited by having to deal with a central purchasing agency rather than the ultimate recipient or user of the equipment.

## Chapter X

### STANDARDS AS TECHNICAL BARRIERS TO TRADE

#### Introduction

A standard, for the purposes of this report, is any law, regulation, specification, or other requirement with respect to the properties of a product or the manner, conditions, or circumstances under which a product is produced or marketed. These requirements usually deal with--

A product's quality, purity, component materials, dimensions, level of performance, or other important characteristics;

The health, sanitary, safety, technical, or other conditions or circumstances under which a product is produced or marketed; and

The manner in which a product is packaged or labelled.

Standards have an enormous, but frequently overlooked, impact on commerce and trade. The simplest illustration is found in weights and measures. A generally accepted standard for weights and measures is virtually a prerequisite for the existence of commerce on any significant scale. The widespread use of a basic standard of this type greatly facilitates the exchange of goods; the use of different standards in different markets or countries tends to have a limiting effect.

For the most part, standards perform an extremely constructive and necessary role in commerce and trade. Adherence to standards helps substantially in the exchange of goods by removing potential misunderstandings between buyers and sellers as to the properties of the product being exchanged. However, standards may also unnecessarily impede

international trade and are sometimes actually used as a protective device to shield domestic industry from import competition.

This chapter examines the trade barrier aspects of standards.

#### The purpose of standards

Standards are created for a variety of purposes. Many, such as a distance, or gage, between railroad tracks, or an industry's agreement upon common dimensions or measurements for a product such as steel sheets, are clearly to facilitate business or trade. Most international commerce is now based on product standards which usually include terminology, definitions, descriptions, ratings, tolerances, performance criteria, test methods, and acceptance procedures. Through these standards, traders in different areas of the world can know exactly what a product is without seeing it. The prevalence and importance of product standards is illustrated by the fact that a single international body dealing with standards for electronic components and equipment has more than 16,000 pages of international standards, published in more than 600 booklets.

Standards are also essential for the protection of the public health and safety, the preservation of the environment, the eradication of plant and animal diseases, and the control of pests. Consequently, a very large--and perhaps the major--part of standards are established for purposes unrelated to commerce or trade. Such standards are primarily intended to protect the public health, safety, and welfare by providing rules for safeguarding plant, animal, or human life and for protecting or informing consumers.

Many of the standards affecting international trade began as efforts by local governments to protect the public health, safety, and welfare. As science and industry have advanced, so have the responsibilities of government and the need for regulations. Advances in sciences such as medicine and plant pathology have led to the development of health and agricultural standards at the national government level. The development of industrial standards was encouraged, or even made necessary, by the growth of industries such as the pharmaceutical, automotive, and electrical industries. As industries developed, trade associations, engineering societies, and similar nongovernmental organizations began to issue standards that became nationally accepted as industrywide criteria.

As industries have broadened in geographic scope, so have standards. In the beginning, national interests dominated the formulation of standards, and in some instances standards have actually been designed to protect domestic industry. However, the vast expansion of international trade and the growth of multinational concerns have given impetus to the development of international standards.

In many countries import regulations reflect a deep-seated distrust of foreign products, and some countries have been motivated to impose regulatory standards on imported products by a fear that if imported merchandise is substandard their citizens will have no recourse against the foreign manufacturer to enforce a penalty. These regulations can be (and have been) used for protectionist purposes.

Trade barrier effects of standards

Some standards are imposed specifically to restrict or control the use of certain materials or substances and therefore can be expected to have a direct restrictive effect upon trade in those products. An illustration is found in the growing limitations being imposed throughout the world on the use of certain insecticides in agricultural production because of their persistence in the environment and damage to ecology.

The objective of most standards, however, is not to restrict the use of products but to assure that they meet certain levels of performance, quality, purity, safety, or sanitary conditions. The standards are intended to apply equally to all products without regard to their origin. However, it has become widely recognized that they frequently impinge more severely upon imports than upon domestic output. Because such an effect is usually inadvertent, standards of this type are characterized as technical barriers to trade. The sources of difficulties for international trade arising from standards requirements can be classified for the most part in four categories: (1) Differences in national standards; (2) the inspection procedures or other measures used for enforcing standards; (3) quality assurance systems which have limited country participation; and (4) ignorance on the part of exporters of the technical regulations existing in the importing countries.

The restrictive effect of standards often results from the differences among national standards (such as differences in language, measurement systems, and climatic and environmental conditions) rather than from

the extreme nature of the measures. Disparities in standards among nations create problems for supplying countries, whose products are placed at a disadvantage by the necessity of complying with diverse requirements for testing, production inspection, and certification.

A requirement that a product must be inspected during various stages of the manufacturing process by an inspector licensed by the importing country, or that a product must be tested in the importing country, can amount to a virtual embargo on the imported product while having little effect on the domestic product. This can be especially troublesome for foreign suppliers if the regulations (1) require expensive testing procedures or make the cost of compliance expensive enough to discourage foreign competitors; (2) are based on characteristics peculiar to national production; (3) foster uncertainty among traders as to the acceptability of their merchandise and the possibility of financial loss; (4) are changed so often that foreign manufacturers are caused needless expense; (5) are administered in such a way as to be discriminatory or cause extra delay and expense; or (6) allow too brief a time for adapting.

The manner in which regulations are written often favors domestic products: standards for imports tend to be explicit and strict while those for exports are generally loose or nonexistent, and marketing and labelling requirements can be extremely protectionist.

The effect of a standard can also be influenced by the membership constituting the standardization bodies, i.e., producers, consumers, local authorities, national government, or a combination of

these. Quality standards written by trade associations and professional societies often contain requirements based on the practices of domestic producers. Such requirements can restrict imported products of satisfactory quality, even though they do not conform to the domestic industry's practices. Some standards of this type are gradually being incorporated into fire regulations and local building codes and specifications. The sales potential of an imported product can be severely restricted as a result of lack of consumer acceptance if it fails to carry the recognized seal or stamp of approval customarily required by certain specifications and standards.

Although some individual product standards, through discriminatory application or for other reasons, have been significant trade barriers even to the point of embargo, standards generally are not presently classed among the serious barriers to trade. However, they do have the potential for becoming one of the greatest of trade barriers if concerted action is not taken.

At all levels of government virtually throughout the world during the past few years, there has developed a heightened concern for the protection of the health, safety, and welfare of consumers and the prevention of further deterioration or damage to the environment and ecology. Mandatory standards for products are being issued in numbers and coverage scarcely imagined only a few years ago. In the United States, for example, the recently enacted Consumer Product Safety Act established an independent regulatory commission which is authorized to issue mandatory safety standards for any consumer product. The objectives of the act are, *inter alia*, (1) to protect the public

against unreasonable risks of injury associated with consumer products, (2) to develop uniform consumer standards, and (3) to minimize conflicting State and local regulations. Product safety standards issued by the commission apply equally to domestic and imported products. The act stipulates that any consumer product shall be refused importation if such product (1) fails to comply with the applicable standard, (2) is not accompanied by a prescribed certificate by the manufacturer, or (3) is not labelled according to the relevant provisions of the act.

#### The development of standards and their enforcement

Standards may be mandatory or voluntary. Mandatory standards are those with which there is a legal obligation to comply. They are made compulsory through regulations and administrative rules issued by an authority having the legal power necessary for such action. Most mandatory standards are concerned with health and safety; some have other concerns such as marking, packaging, and labelling. Health and safety standards and other mandatory standards are generally issued by the local, regional, or national government.

Voluntary standards are those with which there is no legal or de facto obligation to comply. These standards, which usually concern industrial products, are issued by various groups, principally professional societies, associations of manufacturers or consumers, national or international nongovernmental standards organizations, and sometimes government organizations.

The extent to which standards developed by nongovernmental organizations are adopted varies widely from country to country, often depending on the attitude of the government, whose actions can strongly influence both the development and enforcement of voluntary standards. Some voluntary standards actually become quasi-mandatory in effect. Even though the issuing organization has no legal authority to give a standard mandatory force, such force may be acquired through the action of a regulatory or quasi-regulatory body. For example, voluntary standards have frequently become, in effect, mandatory when they have been incorporated by reference into mandatory regulations, such as building codes promulgated by the government. Government procurement specifications often support voluntary standards by requiring compliance in purchased goods. These standards may also become mandatory in practice because of such factors as consumer acceptance, domination of the market by sellers (manufacturers or distributors) or buyers (e.g., public purchasing authorities), requiring compliance as a condition for obtaining insurance, or refusal by power supply organizations to connect noncomplying equipment to their networks.

Many standards are prepared by international groups which have no enforcement authority themselves but depend for effect on action taken by each individual country participating in the program. The participating countries frequently make no prior commitment to adopt the standards developed by the organization, and, consequently,

implementation will vary from country to country. An international standard may become mandatory in one country, voluntary in another, and voluntary with quasi-mandatory effect in another. The groups which prepare international standards may be composed of representatives of central governments or other public authorities, quasi-regulatory groups, or nongovernmental national standards bodies.

The formulation of international standards is centered principally in two international nontreaty organizations, the International Standards Organization (ISO) and the International Electrotechnical Commission (IEC). Both organizations are headquartered in Geneva, Switzerland, and coordinate their activities closely. Their membership consists of the national standardization bodies of the participating countries. These are generally nongovernmental organizations, but the extent of government participation varies widely from country to country. The United States participates in the ISO through the American National Standards Institute and in the IEC through the U.S. National Committee for the IEC. International standards have also been developed in such organizations as the International Bureau of Weights and Measures, the International Organization of Legal Metrology, the U.N. Food and Agriculture Organization, the U.N. Economic Commission for Europe, and the Organization for Economic Cooperation and Development. A variation of the international standard is the regional standard prepared by international organizations like the European Committee for Coordination of Standards and the Pan American Standards Committee, whose memberships are limited to specific geographical or political areas.

Regulatory bodies endowed with the necessary legal authority are generally the medium used for determining compliance with mandatory standards and for enforcing them. The regulatory body very frequently is not the organization that prepared the standard. Enforcement is often carried out through the judicial process.

As mentioned earlier, many organizations which develop voluntary standards actually hold an unofficial quasi-regulatory power for compelling their use. Although such organizations have no legal authority for enforcement, they can in practice give a mandatory effect to their standards through the domination of markets, the use of monopoly power, refusal of insurance, control of an established quality mark, or some similar method. Public purchasing agencies, associations of insurance companies, professional societies, institutions that control an established quality mark, and companies which dominate the production or use of a product in the local market are examples of this type of quasi-regulatory body. In the absence of this type of enforcement of voluntary standards, compliance is normally a matter of agreement between the manufacturer of a product and the customer. Independent testing facilities are often used to determine compliance.

The role of the central government in the enforcement or regulation of standards differs from country to country. In some countries, like the United States, the authority of the central government is limited by constitutional and other restraints. Similarly, the role of the central authority in regional trade and economic organizations, such as the European Community, is limited.

International concordance of standards

Valid evidence of recognition of the restrictive trade effect of divergent national standards is presented by the fact that regional trading blocs, such as the European Free Trade Association and the European Community, turned almost immediately after formation toward the development of a uniform set of standards among their members. The Treaty of Rome establishing the Community calls for the removal of disparities existing between legislative or administrative provisions of the member States which "distort the conditions of competition in the Common Market and thereby cause a state of affairs which must be eliminated." EFTA members particularly looked upon their early development of a similar set of standards as constituting an important factor in achieving free and unencumbered trade among members of the Association.

Of all the categories of nontariff trade barriers, those resulting from standards, because of their nature, probably present the greatest opportunity for amelioration or removal. All countries have an interest in this problem, and there is general recognition that the restrictive effect of standards can be greatly reduced through international efforts toward uniformity.

However, the development of uniform standards on a worldwide basis will not be easy. Administrative procedures setting forth methods for determining compliance with a standard have to be brought into accord. Reciprocal acceptance of fumigation and other

certifications that products are uncontaminated and disease free must be arranged. Various national packaging, labelling, marking, and measurement requirements have to be simplified and reconciled into nonconflicting sets of standards. Standards requiring inspection of a commodity during the manufacturing process must be coordinated among nations and simplified. Tests specified by different countries and organizations have to be made technically equivalent, a task that is particularly difficult because the technical procedures set forth to determine compliance are usually an integral part of a standard and are of extreme importance, especially in performance standards.

Progress is being made in the harmonization of standards through the work of several organizations. As already mentioned, regional organizations of nations are working to develop standards universally acceptable to their members, and in some instances have permitted nonmembers to participate in their programs. Bilateral and multilateral agreements have been made between some nations, and it is anticipated that some important agreements initially restricted to a few countries will eventually be expanded to include all interested nations.

Federated countries such as the United States and regional organizations like the European Community pose special difficulties for a harmonization program. A major problem is the fact that a central government agency has not been given the authority to make commitments which would be binding on private organizations and

local, State, and national authorities. The central authorities cannot require the other jurisdictions to accede to harmonized standards. Another problem is the diversity of jurisdictions administering standards and the lack of a central source to which traders can apply for information about local, State, and regional regulations, such as those governing building, fire, safety, quality, health, and environmental codes.

The United States is moving toward a more active role in international activities toward uniform standards. The administration has introduced legislation in the Congress in the form of two identical bills, S. 1761 and H.R. 7506, entitled the "International Voluntary Standards Cooperation Act of 1973." It provides for a formal arrangement between government and industry in the standards field in order to permit and facilitate U.S. participation in international standards agreements. Representatives of the State Department, working with the Special Committee for Consultation and Negotiation of the Organization of American States, have participated in some preliminary work on the harmonization of health and sanitary regulations. The National Bureau of Standards, in cooperation with a number of nongovernment standards organizations, is developing a national system for the accreditation of testing laboratories. Established organizations such as the American National Standards Institute and the U.S. National Committee to the International Electrotechnical Committee provide a medium for participation at both the national and international levels.

Proposed GATT code for standards

For approximately 2 years the contracting parties to the General Agreement on Tariffs and Trade (GATT) have been working on the development of a proposed code of conduct to prevent the application of standards from becoming a technical barrier to trade. At the present stage of drafting, the proposed code is set up--

1. To encourage participation in standards writing in international organizations so as to harmonize standards on as wide a basis as possible;
2. To encourage participation in international (as opposed to regional) certification arrangements for assuring conformity to standards;
3. To formulate rules for regional standards arrangements so that, in standards writing and certification, these arrangements will not operate to restrict the trade of third countries; and
4. To formulate rules that should be followed by national standards bodies so that standards writing and certification will not create unjustifiable obstacles to trade.

It is expected that completion and ultimate international approval of the code will be accomplished as part of the new round of multilateral trade negotiations opened at the GATT Ministerial Conference at Tokyo in September 1973.

Types or categories of standards

There are several different methods by which standards and related regulations discussed in this chapter have been classified, such as by purpose, by products affected, by chief characteristic, by method of application and enforcement, and so forth. In most of these classifications, the demarcation between categories is not always clear cut,

and many standards have attributes of more than one category. For example, some labelling requirements are the result of health or pharmaceutical product standards; and some product standards contain elements of both safety and performance. The Tariff Commission has generally classified complaints against standards which were received in its survey of trade barriers into the categories initially used in the GATT inventory of nontariff barriers. These classifications were established in the GATT work more on a pragmatic than a theoretical basis simply to facilitate international discussion of similar problems. The types or categories are as follows:

- Health and safety standards
- Labelling and container requirements
- Industrial standards
- Pharmaceutical standards
- Product content requirements
- Marking requirements
- Processing standards
- Requirements on weights and measures
- Trademark problems
- Packaging requirements.

#### Complaints against standards

In the Tariff Commission's survey of trade barriers, there were a total of 520 complaints that standards and related regulations hindered trade. The summary count of complaints made against standards and related regulations, by types, is shown in table 10-A. Health and safety standards appear to give rise to the largest number of trade problems, as they drew 35 percent of the complaints. The next largest number of complaints, 19 percent of the total, was against labelling and container requirements, followed by industrial standards, pharmaceutical standards, and product content requirements.

Table 10-A.--Summary count of complaints made against standards

Type of standard or requirement	Number of complaints			Total
	against--			
	Developed:	LDC's	Communist:	
	countries:		countries:	
1. Health and safety standards-----	153	28	2	183
2. Labelling and container requirements----	60	38	-	98
3. Industrial standards-----	67	3	1	71
4. Pharmaceutical standards-----	46	22	1	69
5. Product content requirements-----	31	8	-	39
6. Marking requirements-----	15	2	-	17
7. Processing standards-----	9	5	-	14
8. Requirements on weights and measures----	12	2	-	14
9. Trademark problems-----	6	4	-	10
10. Packaging requirements-----	3	2	-	5
Total-----	402	114	4	520
Percent-----	77.3	21.9	.8	100.0

Source: Compiled from submissions to the Tariff Commission.

Standards and related requirements in almost all developed countries and a very large number of developing nations were included in the complaints, although the great bulk--77 percent--were against developed nations. U.S. standards drew more complaints in the Commission's survey than those of any other single nation, but less than the total of complaints against members of the European Community or the European Free Trade Association. Table 10-B shows the distribution of complaints against standards, by countries.

Table 10-C shows the distribution of the complaints among product sectors, by types of standard or requirement. Industrial sectors drew 58 percent of the complaints; agricultural sectors, 42 percent. Over three-fourths of the complaints in the industrial area fell in 7 of the 23 industrial sectors: Nonelectrical machinery; chemicals; electrical machines and apparatus; transport equipment; ores, metals, and manufactures; wood and cork and manufactures; and professional, scientific, and controlling instruments. In the agricultural area, five of the nine sectors received virtually all of the complaints; the sectors for grains, tobacco, and oilseeds received a negligible number.

The principal standards and related regulations which have been reported as restricting trade are described in the remainder of this chapter. They are discussed under four headings: (1) Industrial and product standards, which include many miscellaneous standards such as those pertaining to weights, measures, safety, containers, nomenclature, language ingredients, environment, and ecology; (2) labelling and marking requirements; (3) health and sanitary standards; and (4) pharmaceutical and veterinary standards.

The Tariff Commission's survey of trade barriers was designed to obtain estimates of the value of trade lost as a result of the restrictions imposed by the reported trade barriers. Respondents were asked to indicate whether the removal of the barrier would result in a significant, moderate, or small increase in their exports or imports of a particular commodity and also to indicate, if possible, the estimated increase in dollars. Of the responses received concerning standards,

39 percent gave no estimate of the anticipated increase, 39 percent gave only an adjectival estimate, and 22 percent gave both an adjectival and a numerical estimate. Assuming that the organizations actually engaged in international trade should be the most qualified to evaluate the financial impact of trade restrictions, the failure of so many respondents to give any quantitative estimates exemplifies the difficulty of assessing the impact of those restrictions. The respondents whose questionnaires gave both a numerical (dollar) and an adjectival estimate varied widely in their judgment as to the amount of increase represented by each adjective when it was expressed as a percentage of their 1970 trade. However, the consensus of these replies indicated that, in general, "significant" represented an anticipated trade increase of about 150 percent, and "small" about 15 percent. These values are used in the following discussion of individual standards when applicable.

### Industrial and Product Standards

The regulations classified as industrial and product standards relate principally to weights, measures, container sizes, nomenclature, quality, product content, production processes, safety, ecology, and environment. These regulations constitute the largest of the four major subdivisions of standards discussed in this chapter. They also probably hold the greatest potential for trade restrictions insofar as the value of affected trade is concerned.

With the rapid increase in standards stipulated by governmental or quasi-governmental organizations, the trade significance of industrial and product standards increases daily. Virtually all governments in the world have been greatly expanding their regulations, particularly in the fields of environment and product safety, in ways which can have profound effects on trade.

Some products which represent an exceptionally large dollar volume of trade are regulated in virtually all countries. Two of these which are of particular importance for U.S. exports are electrical and electronic equipment and automotive products. An examination of some national and international standards applicable to these products provides a good illustration of the impact which industrial standards of other countries can have on U.S. trade.

Electrical and electronic equipment standards

An international arrangement known as the Multipartite Accord for Assessment and Certification of Electronic Components provides for (1) the establishment of technical standards for electronic components, (2) a system of quality-control inspection carried out by authority of the participating governments to certify manufacturing plants within their jurisdictions as meeting the prescribed specifications, and (3) harmonizing the specifications and inspection procedures of participating countries so that components accepted in the country of origin are equally accepted in the other countries without further testing. Originally begun as a tripartite agreement between the Governments of France, West Germany, and the United Kingdom, membership of the accord has now been expanded to include all members of the European Community and the European Free Trade Association, and administration of the accord has been turned over to the European Committee for Coordination of Electrical Standardization (CENEL), which is administered by private bodies. Standards for the accord are established by the CENEL Electronic Components Committee and the Electronic Components Quality Assurance Committee.

The Tripartite/CENEL accord was developed almost completely before U.S. organizations became aware of its potentially serious adverse impact on U.S. exports. However, as a result of meetings held in June 1971, the members of the accord approved the request of the United States to participate in the scheme. Before the United States can assume the obligations of membership, however, there must be a

functional national system for the certification of electronic components for conformance to specified harmonized standards. To implement this system, the American National Standards Institute has agreed to act as the authorized body responsible for the general management of the system and enabling legislation has been introduced in the Congress in the form of two identical bills, S. 1761 and H.R. 7506, entitled "International Voluntary Standards Cooperation Act of 1973."

Although the quality assurance provision of the accord is not supposed to be in operation, it is already working to the disadvantage of the United States because some countries are not meeting the requirements of the CENEL scheme and are labelling their products accordingly. The United States cannot do this, and until the United States is capable of assuming the full obligations of membership, it must face the possibility that standards with which domestic producers will have difficulty complying will be instituted under the accord.

Respondents to the Tariff Commission's survey of trade barriers asserted that the multipartite accord represents a potentially serious nontariff barrier to trade which, if fully implemented without U.S. participation, could adversely affect U.S. employment, the balance of trade, and balance of payments.

Standards for automobiles and farm and industrial vehicles

The enactment of U.S. vehicle safety and emission laws has been accompanied by an increase in vehicle construction regulations in other areas of the world, particularly in Europe. Regulations governing lighting, electrical, and braking systems, operator and bystander environment, safety equipment, power and capacity ratings, and product testing exist throughout the world. Many of the standards differ from country to country and from those of the United States, whose regulations are often unique. In Europe, for example, the various national standards result in 11 different lighting systems, which require differences in electrical components; three different braking systems; and seven different methods of rating the power of a vehicle. There are variances on seats, fenders, horns, bumpers, and other equipment. U.S. producers or exporters are often required to make modifications in their vehicles which are costly, delay delivery, and sometimes change the appearance of the vehicle. A number of specific regulations reported in the Commission's survey are described below.

France requires the air tank for 100 p.s.i. air brakes to meet the same general specifications which are stipulated for pressure vessels, such as high-pressure boilers. The detailed standard requires specific construction methods instead of performance capability. Consequently, U.S. tractors to be sold in France have to be equipped with different air tanks than those to be sold in other European countries such as Belgium and West Germany.

France, West Germany, and Switzerland have different standards for braking. One country requires a device on tractors to cause the emergency brake to hold in case of engine failure. A neighboring country requires the emergency brake to be easily released to permit moving the vehicle out of the way if it stalls in traffic.

One respondent, in discussing truck trailers and their axles, reported that West Germany maintains a vehicle inspection and certification agency which establishes performance requirements and conducts tests. The German agency, called TUV, will not delegate approval authority to any U.S. test organization; tests must be conducted only in TUV locations. To get a prototype tested and approved, a U.S. company must ship the vehicle to West Germany and, if changes are needed, bring it back to the United States for modification, then return it to West Germany for reinspection. The process is very expensive and time consuming.

A number of West Germany requirements pertaining to tractors were reported. A flashing light must be mounted in a specific location; headlights must be located in a specified pattern and pointed precisely in a designated manner; red and white striped covers must be placed over bucket or bulldozer cutting edges in a precise manner; turn signals must be provided; and fenders must be of a specified design if the tractors are to enter a public road.

The West German regulations listed in the preceding paragraph would not constitute a serious trade barrier except that each item is specified in a different manner in an adjoining country.

Additional problems are created because several European countries do not permit the sealed-beam headlight construction used in the United States. Each country has its own emission requirements and exhaust-measuring device. West Germany and Switzerland require the German Bosch device, France requires a French device, and Belgium requires a Belgian device. Noise regulation varies from one country to another. Switzerland, Sweden, and West Germany each have different noise regulations, and some German provinces also have regulations which vary from the national standards. Codes for roll-over protection and steering differ. Safety regulations of the United Kingdom and the European Community require agricultural equipment to be tested to local standards. If the equipment is approved, the manufacturer must assume liability in case of injury or accident. Engine horsepower is calculated differently in various countries. Greece restricts passenger cars used as taxis in the Athens-Piraeus area to a maximum of 20 Greek horsepower and 5 meters in length.

The automobile tire standards proposed by the Economic Commission for Europe (ECE) represent a potential trade barrier for U.S. manufacturers. Because of the approval procedures and compliance methods regarding its tire labelling requirements, the draft standard could, in effect, prevent the export of any tire produced in the United States to any country in Europe that adopts the draft, despite the fact that the test performance requirements are substantially less demanding than the test requirements of the United States. Under the U.S. standard,

foreign producers are permitted to use self-certification procedures, which apparently are not permitted under the ECE draft.

Some U.S. producers reported that the failure of the United States to use the metric system of measurement has handicapped their distributors, dealers, servicemen, and customers because foreign standards are in terms of the metric system and tools are difficult to obtain.

It is difficult to quantify the effect of the existing and proposed regulations governing the various types of automotive equipment. Any harmonization of standards resulting in a reduction of cost to U.S. manufacturers could contribute to an increase in exports. U.S. exports in 1972 of the automotive products most affected by the regulations discussed above were valued as follows (in millions of dollars):

	<u>To Europe</u>	<u>To all countries</u>
Passenger cars-----	39.2	1,322.1
Tractors-----	57.6	582.4
Trucks-----	12.8	561.3
Buses-----	0.1	18.4
Tires, pneumatic (passenger car, bus, truck, motorcycle)-----	4.3	40.9

#### European Community (of six) <sup>1/</sup>

Members of the European Community, recognizing the hindrance which diverse and conflicting product standards can be to the free flow of

---

<sup>1/</sup> On Jan. 1, 1973, the United Kingdom, Denmark, and Ireland joined the European Community, raising to nine the number of member countries. Most statistical and other data for this report have had to be assembled in terms of EC membership prior to enlargement. To provide comparability with other parts of the report, industrial and product standards in the Community are discussed in terms of the original six members only. Standards in force in the United Kingdom, Denmark, and Ireland are discussed in a subsequent part of the report.

trade within the customs union, have undertaken a program of harmonization of their industrial and product standards. By early 1973, the EC Council had approved some 25 directives in the industrial standards harmonization program, of which 12 concerned automobile standards. Usually the directives require that member States incorporate the harmonized standard into their national legislation within 18 months. Member States are required to permit marketing within their territory of all products which conform to the relevant harmonization directives. Member States may apply a standard at the national level which is less strict than the Community standard, but they cannot apply a stricter standard.

Most complaints concerning the European Community received by the Tariff Commission related to standards requirements of the individual member states. One complaint from an association representing U.S. canned-food producers was against an EC harmonization directive. The Community has published several successive drafts of a harmonization directive for containers for liquid foods using measurement standards exclusively in the metric system. No U.S. can or glass containers presently used for juices would meet this standard, and the standard could therefore amount to an embargo on liquid foods in containers made to the British system of measurement.

The European Community maintains an "adapted varieties list" of grass, forage, and other seeds used for planting purposes. Imports of seeds are restricted to varieties on the list. To be placed on the list, U.S. varieties must be tested for "agronomic value" by

the government and approved. According to the respondents in the Commission's survey, it is very difficult for U.S. seedsmen to get their varieties accepted and placed on the list. Many U.S. seed varieties which are suitable for growing in the Community are prohibited. The maintenance of the adapted varieties list was classified by U.S. seedsmen as an important and significant barrier to their trade with the Community.

The Community's common agricultural policy for wine adopted in 1970 provided that imported wine could be sold in the Community only if it meets minimum standards (i.e., for alcohol and acid content, sweetening, the amount of sulphur dioxide, and so forth) as well as certain supplementary conditions. The supplementary conditions, which did not enter into force until October 1973, require that each lot of imported wine be accompanied by (1) a sworn statement, issued by an official agency of the country of origin, furnishing proof that the wine meets the standards for production and delivery of wine for direct human consumption in that country, and (2) a certificate of analysis stating that the wine has been prepared in accordance with the methods prescribed by the EC Commission or officially used in any member State of the Community. No mechanism presently exists in the United States for providing such certificates of assurance. EC regulations also stipulate that wines only be blended with other wines of the same region and at that place; this effectively prohibits blending of U.S. wine with that produced in the Common Market.

France.--France was cited as maintaining industrial and product standards which restrict trade in a variety of products.

Only 18 karat gold is permitted for karat gold jewelry. The Napoleonic code specifies six entry ports where all such jewelry must be tested and hallmarked. Assay fees for testing foreign products containing precious metal are 7.5 francs per hectogram for silver, 160 francs for gold, and 320 francs for platinum. For gold, the cost for testing alone amounts to over 50 cents per troy ounce.

French railroads require a so-called Mullen-Test of kraft container-board liners to determine the quality of the finished container. Other EC countries (except West Germany), the United Kingdom, and the United States have discontinued this practice. The test favors northern European producers and a single French producer. U.S. producers, who do not supply a substantial quantity to the French market, are required to make special adjustments in their production, which makes the cost greater than the cost of production for the U.S. and other markets.

Gas appliances marketed in France must meet special standards set by a French organization, Gaz de France.

Certain U.S. spirits, such as whisky and gin, are subject to validated approval from monopoly authorities for each shipment. Similar spirits from the United Kingdom, Ireland, and Canada have been granted blanket approval.

General aviation aircraft exporters to France reported difficulties in obtaining certification of new aircraft owing to what were characterized as special requirements.

All pressure vessels, such as heat exchangers and package chillers, must be disassembled, pressure tested by a local inspector, reassembled, and delivered to job sites. This adds a 3-percent cost to the value of a unit.

Exporters of fossil-fired steam-generating equipment complained that interpretation of the French manufacturing and safety codes is left to local inspectors rather than a central body. Because there is no standard interpretation of these codes, foreign manufacturers have experienced sufficient costly delays and expense to prevent them from actively pursuing the steam-generating-equipment market in France.

The standards governing steam-generating equipment, pressure vessels, general aviation aircraft, and jewelry are considered by the respondents to be significant trade barriers. Some companies indicated that their trade in France would more than double if the standards were modified. The remaining French regulations were reported as moderate restrictions.

France requires the submission of samples of the inbred lines of hybrid vegetable seeds before certifying them. U.S. seedsmen found this objectionable because it presents a danger of losing control of the inbred lines.

West Germany.--The complaints registered against the French standards governing steam-generating equipment, pressure vessels, and container-board liners were also reported for West Germany and were described as having the same impact on trade. In addition, a number of other requirements were reported as trade barriers.

Noise requirements are to be imposed by the West German Government that will prohibit the operation of many aircraft in the high-power-to-weight class. This will create a barrier to the sale of some aircraft because a customer will not purchase a plane when he knows its operational area will be limited by law.

Standards issued by the West German Standards Committee (DIN standards) cover many product areas. Film-speed ratings, for example, are covered by these standards. Unless a product conforms to DIN standards it cannot be sold in West Germany. These standards, in addition to the problems they presently create for U.S. producers, represent a potentially serious problem for the future. The Standards Committee could, for instance, adopt ISO metric standards, and the use of U.S. nonmetric screws would bar the product.

Industry and DIN standards for oxyfuel gas welding and cutting equipment differ substantially from the U.S. standards covering these products, and exporters reported difficulty in obtaining approval for U.S. products.

Distilled spirits must be at least 43 percent alcohol by volume (86 proof). In addition, only bottles of certain sizes can be imported.

The West German Bundesrat, on November 12, 1971, approved an ordinance on consumer packaging which established mandatory container sizes. Foods in nonconforming containers are prohibited. The effect of this barrier could be severe, depending on the method used to measure container contents.

West German standards governing scientific apparatus, keys, key machines, and hardware were reported to be discriminatory and restrictive.

The organizations reporting the requirements listed above considered the restrictions on general aviation aircraft, photographic products, scientific apparatus, keys, key blanks, and hardware as significant. The restriction on oxywelding equipment was characterized as a moderate barrier.

Italy.--Italian standards permit only 18 karat gold to be used in gold jewelry. Regulations are imposed on distilled spirits which prohibit the importation of whisky and brandy with an alcohol content of less than 79.8 proof or more than 120 proof. These regulations also specify a maximum impurity content for imports of whisky and rum and require that imports of bourbon must be given a special examination by Italian customs officials. It was also reported that Italian industrial safety regulations applicable to pressure vessels (similarly reported for France and West Germany) require that units such as heat exchangers and package chillers must be disassembled, pressure tested by a local inspector, reassembled, and delivered to the job site.

Belgium and the Netherlands.--The complaint made against France concerning manufacturing and safety codes governing fossil-fired steam-generating equipment was also lodged against Belgium. A U.S. exporter of keys, key machines, and hardware reported difficulty in meeting the Netherlands' safety standards.

European Free Trade Association (of eight) and Finland 1/

United Kingdom.--British certification requirements for both general and commercial aviation were severely criticized by U.S. producers. The procedure to gain certification for general aviation aircraft was described as exceedingly expensive. In addition to travel and per diem expenses, the British Government is empowered to impose requirements which add even more expense. Special conditions are negotiable but can be so expensive that certification becomes impractical. Manufacturers of general aviation jet and turboprop planes have particular difficulty. The standards, according to the respondents, protect the British jet DH-125 and the Jetstream turboprop. U.S. exports of general aviation aircraft to the United Kingdom in 1972 amounted to \$10.2 million.

The British Air Registration Board (ARB), the counterpart of the U.S. Federal Aviation Administration (FAA), charges for certification of U.S. aircraft. No other country charges for this certification. The fact that ARB standards are similar but not identical to those set by FAA creates a significant barrier. For example, one U.S. model would have to be reengineered at a cost of about \$700,000 to meet current British standards. The non-recurring cost to certify a very large model of commercial aircraft was reported to be \$1.2 million, and for a smaller model, \$440,000.

---

1/ The discussion covers EFTA members at the time the Tariff Commission survey was made. On Jan. 1, 1973, the United Kingdom and Denmark terminated their association with the EFTA and became members of the European Community.

The certification costs for another model was reported to amount to about \$375,000 per expected aircraft sale.

The age of distilled spirits must be certified. A minimum age of 3 years is required.

Under British hallmark laws, the stamping of gold and silver articles is mandatory, not optional. Each piece of jewelry purporting to contain precious metal must be sent to the British Assay Office and be individually assayed. In assaying an article such as a coffee pot, each part is assayed separately, i.e., handle, spout, finial, foot, and cover. Assaying requires the removal of some of the metal. If an article is up to the quality indicated, it is stamped as to its quality; if it is not, it is seized and destroyed. As metal is removed for assay, the article usually becomes unsaleable unless some refinishing is done. This is a simple process if the manufacturer is British. If he is a foreign producer, the product must be shipped back to the foreign manufacturer for refinishing and then be shipped back to Britain. British manufacturers will not refinish a foreign product.

The hallmark laws were referred to by the respondents as "the most effective nontariff trade barrier against the import of jewelry made of gold or silver existing in the world" except outright bans on jewelry; however, they did not give an estimate of the value of trade lost.

Denmark.--The electric current in Denmark is of higher voltage than in many countries. Electrical equipment for use in or supplied from areas with low-voltage utilization systems must undergo official testing. Many consumer-type electrical appliances are affected by this regulation, which is considered by the respondents to be a significant deterrent to trade.

Finland.--Safety standards for electrical equipment and appliances were considered by U.S. exporters to be significant trade restrictions. Imports of compound fertilizers require a Ministry of Agriculture permit regarding quality.

Norway.--Regulations require that the binding sole of all shoes must be made of a single piece of natural leather. Technical standards require electrical appliances to be tested by a state agency.

Sweden.--Technical standards for electrical appliances and equipment are rigidly enforced, and imports must be approved by a Swedish Government institute for testing and approving electrical equipment (Semko). Safety regulations for motor-driven, rotary-blade lawnmowers were reported to be stringent. Articles of precious metal must be hallmarked by the Swedish Assay Office prior to customs clearance. The inhibiting effect of these standards on trade was considered to be significant by the respondents.

Switzerland.--Government regulations require that silverplate must be fused to base metal, not electroplated. This is the only country having such a requirement, according to the respondents. Switzerland also prohibits the operation of many general aviation

aircraft in the high-power-to-weight class because of noise regulations. This regulation was imposed in September 1971, and inhibits the sale of aircraft because purchasers will not buy an aircraft whose area of operation is limited. A significant increase in sales was predicted if these restrictions were removed.

#### Japan

The following Japanese regulations pertaining to product standards were reported as restricting trade. A certificate of age, origin, and authenticity must be supplied for bourbon whisky. Standards on food packaging are reported to be restrictive, and the introduction of new products has been inhibited by difficulty in obtaining Government approval for the packaging.

The requirements for clinical trials and evaluations of medical and clinical apparatus are reported to be much greater than those enforced by the United States and are considered by some U.S. manufacturers to be too strict.

U.S. exporters have been able to sell personal aircraft to Japanese distributors only when they had an actual order because of a requirement of Japan's Civil Aeronautics Board that the end user must document himself as a qualified pilot, or show that a qualified pilot would be available, as well as show that an aircraft mechanic was under contract to maintain the aircraft and that there was a parking space reserved at a suitable landing field. (Enforcement of this regulation has apparently been relaxed to some extent since it was reported in the survey.)

Karat gold goods over 9 karats are banned. Japan has an elaborate certification program with respect to local safety standards for sensitized photographic supplies, often requiring product testing. A major problem is the time required for conducting tests.

The Japanese standards reported in the Tariff Commission's survey have varying effects on trade. The effect on whisky imports is apparently small; on imports of personal aircraft and gold jewelry, it is reported as moderate; and on imports of new food products, photographic supplies, and medical and clinical apparatus, it is significant. U.S. exports of personal aircraft to Japan amounted to \$3.2 million in 1972. One respondent, in discussing photographic products, made the following statement:

"In the case of developed countries, such as Japan, where there are, or have been, both tariff and nontariff barriers affecting the balance between domestic and foreign sensitized goods, it is estimated that U.S. exports might be double their present amount if such barriers had not existed in recent years."

In 1972 the United States exported 29.4 million dollars' worth of sensitized photographic goods to Japan.

#### United States

In the Commission's survey of trade barriers, complaints against the United States in this area were directed principally against the U.S. industrial or product standards (or procedures connected with their development or administration) which are summarized in the following paragraphs.

Department of Transportation standard for high-pressure gas cylinders.--All cargo tanks and compressed-gas cylinders must be tested and analyzed during the process of manufacture. Chemical analysis checks on the steel of high-pressure gas cylinders and mechanical and hydrostatic tests on the cylinder itself must be carried out within the United States. No provision is made for inspection outside the United States and, consequently, high-pressure gas cylinders of foreign manufacture are virtually excluded from the United States. Changes in the regulations have been under consideration for some time but no decision has been made.

Coast Guard inspection of safety equipment.--Safety equipment used on U.S. flag vessels must be inspected during manufacture and approved by the U.S. Coast Guard. The Coast Guard will not delegate inspection to foreign authorities and Coast Guard inspectors are not available for this purpose outside the United States; thus access to the U.S. market by foreign manufacturers is precluded.

Safety and emission standards for motor vehicles.--Motor vehicles cannot be sold in the United States unless they comply with federal safety and emission control standards and they cannot be sold in California unless they meet even more stringent California emission control standards. The regulations were considered particularly burdensome by foreign manufacturers who often were required to make major adjustments in their products involving great technical difficulties and heavy expenditures. The regulations were considered by some to be inappropriate for the smaller foreign-made cars.

Foreign producers also complained that the burden of complying is increased by the absence of a centralized responsibility for the standards, which makes it difficult for foreign producers to keep informed of changes and interpretations. The National Highway Traffic Safety Administration sets Federal safety standards, the Environmental Protection Agency sets Federal emission standards, and the California Air Resources Board sets that State's emission standards.

Underwriters Laboratory inspection guarantee.--Certain States and communities require the Underwriters Laboratory (UL) guarantee of inspection on products such as electrical appliances and apparatus, medical equipment, and gas- and oil-burning equipment. This guarantee is also often required to obtain insurance. Although the UL label can be obtained by foreign producers, it is more difficult for them than for domestic concerns. The required tests are often duplications of tests already conducted in the country of origin. This, when added to the charges and traveling expenses of U.S. inspectors, increases the cost of imported articles substantially. Some reporters consider the Underwriters Laboratory standards to be clearly discriminatory against foreign products.

Standards of professional and industrial associations.---In addition to the Underwriters Laboratory standards discussed above, the standards of many professional and industrial associations have the force of law in the United States. The seals of approval issued by these organizations are widely accepted or required by local authorities. Requirements such as testing within the United States and

inspection of manufacturers' production facilities by the organizations that issue the seals are more restrictive for foreign concerns than for U.S. companies and often amount to an embargo on some products. Standards of the National Sanitation Foundation, the National Board of Fire Underwriters, the American Bicycle Manufacturers Association, the American Society for Testing Materials (ASTM), the American Society of Mechanical Engineers (ASME), and the National Board of Boiler and Pressure Vessel Inspectors were cited for their restrictive effect by respondents to the Commission's survey. Products such as plumbing, heating, and firefighting equipment, lumber, pressure vessels, boilers, industrial fans, bicycles, and steel are affected.

One complaint received was that the American Bicycle Manufacturers Association has adopted and extensively advertised a set of proposed safety standards which assert that when the front wheel of a bicycle has been assembled at the factory, it is safe (as certified by an independent testing laboratory), whereas bicycles shipped with the front wheel unassembled (i.e., foreign-produced bicycles) pose a threat to the rider's safety. The complainants fear that these standards, although presently unofficial, could be incorporated into State and local safety regulations. Generally, the mere suggestion that products are unsafe if they do not bear the industry's seal of approval can impair a foreign company's competitive position in the U.S. market.

The ASTM was criticized for issuing standards which permit the use solely of steel manufactured according to the Martin Bessemer acid

or L.D. processes and exclude the Thomas process generally used in Europe.

Probably the most restrictive standards of this type have been those of the American Society of Mechanical Engineers and the National Board of Boiler and Pressure Vessel Inspectors relating to boilers and pressure vessels. Laws of many State and local jurisdictions require that these articles be inspected in the United States and bear the symbol of the ASME, which has not, in the past, granted manufacturers outside the United States and Canada the right to use the symbol.

Boilers and pressure vessels used within the jurisdictions referred to are required to conform to the ASME code. The codes generally require inspection and certification by an inspector licensed by the National Board of Boiler and Pressure Vessel Inspectors. In addition, some States require that the inspector be a State employee and not an insurance company inspector; other States accept an insurance company inspector if his company is licensed to do business in the State. If, after inspection, the equipment is found to conform to the code, the inspector must apply to the chief boiler inspector of the State, who, if satisfied, then asks the ASME to release its seal to the manufacturer for the purpose of marking the product. The goods do not qualify unless both the inspection and marking requirements are met. Legislation in some States to permit waiver of the ASME marking requirement has apparently been ineffective.

The ASME has maintained a policy of not issuing its seal to manufacturers outside the United States and Canada, thus requiring that inspection be made in the United States. Even when an inspector licensed by the National Board of Boiler and Pressure Vessels Inspectors was available in the United Kingdom, the ASME refused to issue its seal to that country. The industry has made public statements that a change in regulations would be undesirable because of foreign competition.

On July 22, 1971, the U.S. Department of Justice filed an anti-trust suit against both the American Society of Mechanical Engineers and the National Board of Boiler and Pressure Vessel Inspectors alleging that the rules, regulations, and activities of these organizations unreasonably restrained importation of foreign-made boilers and pressure vessels into the United States. On September 11, 1972, a final judgment was entered under which the defendant organizations will establish a procedure enabling foreign manufacturers who meet the requirements to use the symbol stamps on an equal basis with domestic manufacturers.

Federal Housing Administration standard for window glass thickness.--In most developed countries, the standard for single-strength window glass (the type used in most residential windows) is 18 ounces per square foot. After 18-ounce glass became a competitive factor in the U.S. market, the Federal Housing Administration (FHA), in 1963, issued revised standards for glass which required 19-ounce glass in FHA-financed housing. Inasmuch as FHA housing constitutes a large

segment of the U.S. market and FHA standards are often incorporated into State and local building codes, 18-ounce imported glass is effectively excluded from a major part of the U.S. market.

Agricultural marketing orders.--Marketing orders are issued by the U.S. Department of Agriculture and regulate the grade, size, quality, and maturity of various vegetables, nuts, and fruit which can be sold in the United States. When such regulations are imposed under section 8E of the Agricultural Adjustment Act on the marketing of domestic products, they apply equally to imports. U.S. importers contend, however, that the effect of the orders on foreign produce is often much greater than on domestic produce. An example, as cited by a respondent to the Commission's survey, was a requirement that the minimum diameters of green and ripe tomatoes sold in the United States must be at least 2-9/32 inches and 2-17/32 inches, respectively. This order, according to the respondent, had the effect of excluding from 30 to 50 percent of the Mexican tomato crop while only a small proportion of the season's Florida crop was affected.

Firearms regulations.--Imports of hand guns are prohibited unless they meet rigorous tests imposed by the U.S. Government. Domestically produced hand guns are not subject to any test. No surplus military firearms are allowed entry. Also prohibited are new weapons which incorporate the frame and receiver of a surplus military firearm. Respondents to the Commission's survey and some foreign governments consider the Gun Control Act of 1968 to be discriminatory.

U.S. Government specifications.--Some Federal specifications for Government purchases require inspection by Government inspectors and special packing for overseas shipments that exceeds commercial export standards. U.S. exporters complained that these requirements cause added expense and delay.

U.S. measuring system.--The United States was criticized by domestic manufacturers for its failure to adopt the metric system. The complainants stated that use of the English system of measurements restricts the acceptance of U.S. products overseas. One U.S. producer of welding products estimated an increase of \$200,000 in its exports if regular production was on the metric system.

#### Canada

A number of complaints were received concerning various standards in Canada, usually reflecting the activities of the Canadian Standards Association (CSA). The unique character of certain Canadian standards often requires manufacture of a product designed specifically for the Canadian market. For example, the CSA requires separate fuses for the top and bottom burners of electric ranges, requiring reengineering by U.S. companies. CSA standards have been written into law in some provinces. Approval of products can be obtained in only a few places, and the standards have delayed introduction of new U.S. products into the Canadian market.

Another significant Canadian barrier to trade is a limitation on the number of container sizes in which certain foods can be retailed.

Five can sizes that are standard and in common use in the United States and several other countries are forbidden in Canada. Among these is the size 303 can, which is the common size for vegetables in the United States. The prohibition against these can sizes arises from the Canadian Agricultural Standards Act, which limits the number of container sizes for the declared purpose of aiding consumers by making it easier to compare prices without having to evaluate the differences in content of a variety of can shapes and sizes.

The Canadian standards listed above are considered significant trade barriers by the respondents in the Commission's survey, but they could not quantify their effect.

Under the fresh fruit and vegetable regulations of Canada's Agricultural Products Standards Act, Canada forbids the importation of U.S. fruit and vegetables that do not meet the grade and quality standards of any U.S. marketing order in effect for these products if marketed in the United States. However, under the act, Canada's Department of Agriculture may authorize import shipments under such conditions as it may prescribe. Respondents to the survey believe this authority has been used to permit imports from countries other than the United States of vegetables, particularly tomatoes, that did not meet the standards of U.S. marketing orders. This practice would give foreign producers a competitive advantage in that they could market a larger part of their crop than U.S. producers and thus lower their unit costs. At present, the marketing of fruits

and vegetables in the United States is controlled by almost 50 marketing orders. All U.S. products subject to these orders are also subject to the Canadian restrictions.

#### Australia

Regulations governing the weights and measures of packaged goods were declared by complainants in the Commission's survey to be arbitrary. It was also reported that Australia is planning to convert to the metric system and its Metric Conversion Board has proposed to establish standard sizes for cans used for food. Non-conforming sizes would be prohibited. The conversion could result in new sizes that would be a significant barrier to trade in U.S. canned foodstuffs.

#### Developing countries

Argentina and Venezuela.--Aircraft imported into Argentina for general aviation purposes must be assembled in Argentina. All manuals must be translated into Spanish, which can require a considerable investment by the U.S. exporter, particularly when numerous model changes are involved. A similar language requirement was reported for Venezuela. Both types of regulations were reported to be insignificant trade restrictions. U.S. exports of personal aircraft to Argentina were valued at about \$4 million in 1972; exports to Venezuela, at \$7.1 million.

Mexico.--An exporter of chemical products to Mexico reported that import permits would not be issued unless the chemical formulas were

revealed. Although willing to submit samples of the product for examination, the company will not reveal its formulas, which are considered part of the company assets. Other respondents reported that Mexican regulations governing weights, measures, and product content impede trade.

Other developing countries.--In addition to the complaints against Argentina, Mexico, and Venezuela, the Commission received numerous complaints against industrial or product standards maintained by a large number of other developing countries. For the most part, the complaints against regulations or requirements which were found troublesome by U.S. exporters in developing countries were along the same lines as those reported for developed nations and described in the preceding pages. Exporters of poultry products reported that the requirement in several Moslem countries that imported poultry must be certified as having been slaughtered in accordance with Moslem law was a hindrance to U.S. poultry exports to those countries.

## Labelling and Marking Requirements

Most countries have laws and regulations specifying requirements for labelling or marking certain products. Such requirements are intended to insure that the purchaser or consumer is supplied with important facts concerning the product or its use. In the industrialized countries, the growing concern for consumer protection is bringing an increasing number of products under labelling requirements and expanding both the kind and specificity of information which must be disclosed on the labels.

As trade barriers, labelling and marking requirements should be classified mostly as "nuisances" rather than "major obstacles," although certain requirements of several countries represent significant barriers for some products. If the label which a producer uses for his home market does not satisfy requirements in foreign countries, the producer must incur additional labelling expense if he wishes to export. The cost may become significant, especially if the labelling requirements for a product, such as alcoholic beverages, are complicated and differ considerably in detail among countries.

In addition to this type of inconvenience and supplemental cost, many producers contend that sales of their products are inhibited by the information which must be disclosed on the labels or the manner in which the disclosure must be stated. Most concerns reporting on labelling and marking requirements in the Tariff Commission's survey indicated that international harmonization of these

requirements would reduce their cost of doing business but would not result in an appreciable increase in trade; however, it would enable some companies to increase their trade in low-volume articles, and, for some firms, would result in a substantial increase in trade.

#### "Marks of origin" requirements

Many countries require imported products to be marked to show the country of origin. The requirements vary from country to country, as well as from product to product for a particular country.

The United States, under the Tariff Act of 1930, has a general requirement that imported articles be legibly marked in a conspicuous place to show the English name of the country of origin; the marking must be as nearly indelible and permanent as the nature of the article will permit. There are also special marking requirements for some specific commodities. Many articles that cannot be readily marked are exempt from the requirements, but their outermost container must be marked to show the country of origin. In addition, the Federal Trade Commission under the Federal Trade Commission Act requires that certain foods manufactured in the United States of imported ingredients must be marked to show the country of origin of the ingredients when the consumer might be deceived by the absence of such marking; the Fur Products Labelling Act requires invoices, advertisements, and labels to show the country of origin for such products; and some technical societies have established marking requirements.

Most of the other industrialized countries and many developing countries have extensive lists of specific commodities which must be marked to show origin, or specify particular conditions under which origin must be indicated. The United Kingdom, for example, has issued marking orders for so many individual commodities as to constitute virtually a general requirement.

"Marks of origin" requirements are probably the most universally criticized of all labelling regulations; it is charged that they are imposed to protect domestic industry rather than to inform and protect the consumer. The United Kingdom, Japan, Canada, and the European Community have formally complained that U.S. requirements for "marks of origin" are excessive and more difficult to meet than those of most countries. Also, a number of U.S. firms returned questionnaires to the Tariff Commission criticizing certain aspects of U.S. regulations. Because of the complexity of the regulations and the heavy fines assessed for violations, and citing such time-consuming, costly, and technically difficult requirements as imprinting origin marks on plastic-coated fencing and marking structural steel and electric power cable, the foreign complainants classified these regulations as significant barriers to trade.

The U.S. importers whose questionnaire responses concerned country-of-origin marking believe these requirements frequently cause marketing discrimination in favor of domestic goods. Many domestic producers, on the other hand, feel that for a number of articles such as Irish linen, English woolens, Belgian lace, and various

optical goods, foreign origin is considered prestigious. Importers also objected to the marks of origin requirements of the American Society for Testing Materials and similar requirements of other organizations, and also complained of difficulties encountered in connection with the section of the U.S. marking regulations dealing with importations in bulk.

Generally, when a commodity is imported in bulk and sold to a manufacturer for use as a component in his product, that manufacturer is considered the final consumer of the article and the importer may provide a statement naming the country of origin in lieu of marking each individual piece, providing the outermost containers are marked to show the origin. One complaint stated that customs officials often delay the admittance of bulk merchandise when they have difficulty finding the country-of-origin marking, even though the final consumer has been notified of the origin by mail prior to the importation and the importing company can show proof of origin. Another complaint was that the cost of marking each individual item was so great, the importers could not afford to sell to nonproducers but were forced to sell only to manufacturers as the "final" consumer. 1/

---

1/ A manufacturers association criticized as too lax the regulations which permit marking the outside container only, stating that the lack of identification on small, inside boxes, or on the product itself, permits sellers to pass off imports as U.S. merchandise since frequently domestic producers using the imported articles are under no obligation to disclose the country of origin to the ultimate purchasers or users.

The concerns submitting the complaints and information discussed above are importers of rubber products, brass and copper tubing, steel shapes and bars, pipe, wire rod, hardwood products, radio parts, and valve and pressure gauge parts.

Reports to the Commission indicated that adoption of less stringent U.S. marking regulations would reduce the cost of importing into the United States and would probably be followed by a slight increase in imports of certain products. It would enable some companies not presently trading in the United States to compete in this market. Relaxing the requirement for marking individual items could result in substantial increases in business for some U.S. importers. One company alone estimated an increase of over \$300,000.

Marks-of-origin requirements for canned food products sold in France also provide a good illustration of the increased cost that can be incurred in complying with such regulations. France requires the name of the country or origin to be embossed in the end of cans to be filled with food items. As it is impossible to emboss the cans after the pack is completed, the embossing has to be done before the product is canned, which creates special production-run problems in filling orders to be shipped to France. Sometimes the requirement can be filled by stamping the can ends with indelible ink. Either system of marking is burdensome and expensive. Other countries, including the United States, permit country-of-origin marking

to appear on labels. The complainant, a trade association, predicted a significant increase in sales if this French requirement were removed.

#### Labelling of alcoholic beverages

Throughout the world, alcoholic beverages vie with pharmaceutical products for the distinction of being the product subject to the most numerous and complex labelling requirements. U.S. exporters of distilled spirits must comply with a multitude of special labelling requirements. The European Community, the United Kingdom, Japan, and 16 additional countries are named in replies to the Commission's survey as having regulations requiring certain specific information to be furnished on labels and, in some instances, specifying how this information must be shown. Data required on labels include alcoholic content in percent, name and address of importer or distributor, net weight and measurements of contents, country of origin, description of spirit, license number, and name of the bottler. The regulations also specify requirements such as minimum letter and figure sizes; specific locations on the label for required information; number, size, and type of labels; outer cartons to be marked with the number of bottles and measure of contents; color of print; and language to be used, as well as information that must not be on the label. These requirements are not common to each country; some apply to one country, some to another. The problem confronting a company that exports to many countries is severe. Special labelling requires special handling, which increases the cost of the product.

U.S. exports of distilled spirits amounted to approximately \$22 million in 1972; a large part of the exports were shipped to countries having special labelling regulations. Because of the large volume of exports, harmonization of labelling requirements would result in a considerable savings in cost, thereby increasing net profits even without an increase in sales. The respondents gave no estimate of a sales increase resulting from elimination of this barrier.

British exporters of Scotch whisky to the United States and U.S. importers of alcoholic beverages object to the regulations requiring the submission of copies of label approvals to Customs authorities. The Federal Alcohol Administration Act requires that labels for alcoholic beverages must be approved by the Alcohol, Tobacco, and Firearms Division of the Treasury Department, and copies of these approvals must be submitted to Customs authorities by an importer with each order of spirits or wine brought into the United States. An importer must maintain hundreds of label approvals and reproduce the approval for each label in a shipment to clear it through customs. Imports are frequently held up over label changes which the importer considers minor or insignificant and resultant delays are costly to the importer. Wines are especially susceptible to spoilage while awaiting delivery from the docks because of changes in atmospheric conditions.

One respondent complained that label approval and the granting of licenses for the importation of Scotch whisky into the United States takes 2 years to complete.

The respondents estimated that a change in the procedure, or regulation, to eliminate this barrier would result in a moderate increase in import sales. Based on 1972 imports, a one-percent increase in imports of Scotch and Irish whisky alone would amount to more than \$2.5 million.

Multilateral agreements have been made among a group of important wine-producing countries of Western Europe, including France, West Germany, Portugal, and Spain, providing for international registration of wine appellations by place of origin in producing countries. Wine entering commerce in the signatory countries is labelled in accordance with the registered designation. In granting registration, the wine is identified with respect to geographic origin and certain qualities or characteristics. One result of the agreement is to provide exclusive labels to signatory countries in the marketing of designated wines. Under these agreements, for example, the name "Port" is reserved to wines produced in Portugal; "Chianti," to wines produced in the province of Toscana, Italy; "Sauterne" and "Champagne," to wines produced in the Bordeaux and Champagne districts of France, respectively; and "Sherry," to wines produced in Spain.

The development of an international market for U.S. wines is impeded by these multilateral agreements. U.S. producers contend that labels should be accepted by foreign countries if they eliminate any possibility of deceiving the consumer and clearly indicate that the wine, no matter what the appellation, was produced in the United States.

These agreements were classified as serious trade barriers by the complainants; however, they gave no estimate of the increase in exports anticipated if the barriers were removed. U.S. exports of wine in 1972 were valued at \$1.6 million.

#### Labelling of pharmaceutical products

Most nations maintain specific labelling regulations for pharmaceutical products, trade in which would be greatly facilitated if there were international harmonization of the requirements.

Most countries require, in addition to the name and description of the product, the percent of ingredients, directions for use, precautions, and the name and address of the manufacturer. Many countries also require, in a variety of forms, the name of the technical director in charge of producing the item, the registered number of a local permit to sell the product, the date of manufacture and "lot" number, the date of the "expiration" of the product, the scientific name of the product, the capacity of the container, and the consumer price. The United States has rigid labelling requirements for pharmaceuticals which apply equally to imported and domestic products. 1/

#### Miscellaneous labelling requirements

Austria.--Citrus fruit treated with diphenyl and waxes for sealing the flavor must be labelled as an "adulterated" food product. If the surface of the fruit is chemically treated, the label must warn against the use of the peel for food purposes.

---

1/ For details of these requirements see Food and Drug Administration, U.S. Department of Health, Education and Welfare, Requirements of the United States Food, Drug and Cosmetic Act, 1972.

Canada.---The recently enacted Canadian Textile and Labelling Act requires that labels and the outer wrapper of packaged goods must be marked with the fiber content and country of origin of the goods in both English and French. Also, the selvedge on textile yard goods must be imprinted with the generic names of the textile fiber content in both English and French. Respondents to the Commission's survey feel that this act may "drastically curtail" U.S. export sales to Canada, and they consider it to be a significant trade barrier. One company estimated it could expect an increase of \$4.5 million in the value of exports above the curtailed level of such commodities as woven and knitted fabrics, towels, bedsheets, bedspreads, and pillowcases if the provisions of the act were moderated.

One respondent complained that Canadian labelling and container regulations made it impossible for its plant in Canada to import adhesives and estimated that its exports (the value cited was small) would triple if the barrier was removed. A producer of marine paints, engine additives, and polyester resins stated that Canada's labelling laws, because of their administration, were extremely effective in keeping certain low-volume goods from entering the country. In addition, this producer expressed the opinion that the laws seemed designed to encourage U.S. firms to establish production facilities in Canada to protect their more profitable areas of distribution. An increase of about \$300,000 was projected by this company for its exports if the labelling requirements were reduced.

West Germany.--Diphenyl, a spoilage inhibitor, is used by U.S. citrus growers as a fungistat when shipping their product long distances. West German law requires that oranges or lemons treated or waxed with diphenyl must be labelled to state that the peel is unfit for human consumption. U.S. producers state that the need for this restriction is not based on scientific fact, and they contend that a review of the available toxicological data secured through the Food and Agricultural Organization of the United Nations established the safety of diphenyl and a recommended tolerance of 110 parts per million. Approval for use of diphenyl within the European Community has been granted, but on the basis of a tolerance of only 70 parts per million and with a restrictive clause requiring labelling in retail stores.

U.S. citrus growers complain that labelling the peel "unfit for human consumption" inhibits the consumer and favors nearby growers that can ship fruit without treatment. U.S. citrus growers estimate that the depressing effect of this label on their prices causes them to lose about 15 percent of the value of their produce sold in West Germany. Based on the value of oranges and lemons exported in 1972, this would amount to almost \$200,000. In addition, it was reported that some increase in sales would be realized if this requirement was removed.

Complaints were registered by U.S. producers of canned shrimp, poultry, and game products against regulations which require that labels be in the German language and that the date of production be

placed on the label. One producer predicted an increase of 4 percent in his total export sales if this latter requirement were abolished.

Japan.--Japanese labelling laws require that weights and measures must be indicated in metric units on all goods sold in Japan. Dual labelling is prohibited; therefore, the avoirdupois or fluid ounce declarations which customarily appear on U.S. labels must be obliterated or overlabeled. Japan also requires a label declaration on canned food containers of the name of the importer and the date of importation. Importers of canned food are meeting the foregoing requirements by obliterating all non-metric declarations and applying a special preprinted sticker to each retail container. This increases the distribution and retail costs of U.S. products when sold in Japan.

The respondents projected a significant increase in sales if these requirements were moderated. U.S. exports to Japan of canned food items such as fish, candied fruit, jams, fruit juices, vegetables, sauces, salad dressings, soups, yeasts, and various other food preparations amounted to about \$23.9 million in 1972. Using the criteria derived from the questionnaires, a small increase in exports would amount to almost \$3 million, and a moderate increase, to about \$6 million. Since products other than food items are affected by the metric labelling requirement, the increase in exports of all products could be substantial.

Mexico.--Textiles and apparel must be marked to show the trademark registration number, the name and location of the factory, and the kind of fiber or fibers (with percentages of each) used in the products. Canned food labels must give the registration number of the food product and the name of the importer.

Saudi Arabia.--All 60-cycle electrical equipment shipped to Saudi Arabia is required to carry special labels indicating that the equipment can be converted to operate suitably on 50 cycles. The labels must be affixed prior to shipment. This has created additional expense for the respondent, who has also had to delay shipping equipment until the required alterations could be made.

Enforcement of a regulation requiring Arabic labels on canned soups and juices, originally scheduled to begin in February 1972, was postponed until February 1973. The respondent indicated that he could expect his sales in Saudi Arabia to increase by almost 80 percent if this requirement was not enforced.

South Africa.--Goods prepared for sale by weight or measure in prepacked form must have the size, quantity, or dimensions described in terms of the appropriate metric unit. South Africa has indicated that at some date in the next few years all labelling specifying weights and measures must show metric units as the predominant unit. At the present time individual companies are being asked whether they have a plan for compliance. The United States will be at a serious competitive disadvantage to those nations currently following the metric system when this regulation becomes effective.

United States.---The U.S. Fair Packaging and Labelling Act requires that labels must contain a description of the nature of the product, identify it, give the name and place of business of the manufacturer, packer, or distributor, and give the quantity or net weight of the contents. Some provisions of the act specify the placement of the marking, size of type, and terminology to be used.

The United Kingdom, Japan, and the Nordic countries believe the requirements of the Fair Packaging and Labelling Act are too stringent and place an unnecessary burden on foreign exporters.

U.S. importers complained that small European firms in particular are adversely affected by this law because the requirements of the European Common Market differ from those of the United States, and companies trading in both the European and U.S. markets must print different labels for each area. The sales potential in the United States for small European concerns is said not to be great enough to repay the costs of printing special labels, and these concerns, therefore, are virtually excluded from the U.S. market. Importers responding to the survey expressed the belief that modification of the Fair Packaging and Labelling Act would lead to a moderate increase in sales to the United States of European food items packed in consumer-size containers. Based on the numerical estimates received in the survey, this could mean as much as a 30-percent increase.

All textile fiber products imported into the United States must be marked showing the generic names and percentages by weight of the constituent fibers, the name of the manufacturer, and the name of the country where manufactured. In addition, most articles of wool must be labelled to show content of wool, reprocessed wool or reused wool. Textile products must also comply with the requirements of the Flammable Fabrics Act.

British manufacturers of women's and girls' outerwear asserted that with respect to the fiber content of goods and, especially, the requirements of the care labelling of textile products regulations, the provisions of the U.S. Fiber Products Identification Act present a serious handicap to their efforts to export to the United States. One example of the problem cited by the respondents is the ruling that labelling an article of wearing apparel "Dry Clean Only" is prohibited if the garment can be easily and safely cleaned by either washing or dry cleaning, and the instruction "Dry Clean" may not be sufficient by itself. Another example cited is the label "Never Needs Ironing," which cannot be used if an article can be ironed. The respondents complained that this regulation applied even to products which the public generally would not expect to be suitable for any treatment other than dry cleaning. According to the British manufacturers, these regulations increase the cost of production and, therefore, the cost of the finished product. No estimate was made of a possible increase in sales if these regulations were moderated.

U.S. importers of fish and seafood products and British producers of cocoa, chocolate, and confectionery products complain that the State of New York has established labelling requirements which differ from those established nationally under the Fair Packaging and Labelling Act. For example, New York law requires that the name and address of the importer be printed on the label. Imports of packaged products are inhibited by the need to design labels to meet different requirements. Modification of these regulations should lead to a slight increase in sales, but an estimate of the increase was not projected by the respondents.

It was noted by certain respondents that the stringent marking requirements for watch movements contained in the U.S. tariff schedules had an inhibitive effect on imports, although the requirements were considered necessary to protect consumers. Also cited were the U.S. requirements for marking Agency for International Development shipments. When shipments are being made from various points in the United States a great amount of correspondence and coordination is required to insure that the proper size and type of emblem are used.

Other countries.--The Tariff Commission received numerous miscellaneous complaints against labelling requirements of several less developed countries. The largest number of these pertained to labelling regulations for canned food products, such as requirements that the label show the name of the importer, a local registration number, the packaging dates, and be in the language of the importing

country. These labelling regulations in combination with requirements for registration of the product and sanitary certificates to accompany the shipment were characterized by the complainants as significant trade barriers.

## Health and Sanitary Standards

Virtually every country has laws to protect the health of its human, animal, and plant population. Such laws usually seek to prevent the introduction and spread of disease, to insure sanitary conditions and minimum health standards in processing food for human or animal consumption, and to prohibit the sale of unwholesome or contaminated food.

Because protection of its human, animal, and plant life is regarded as a matter of primary importance to every country, among the general exceptions to the rules set out in the General Agreement on Tariffs and Trade is the stipulation that "nothing in this Agreement shall be construed to prevent the adoption or enforcement by any contracting party of measures to protect human, animal, or plant life or health." Like the other exceptions to the General Agreement, however, this exception is subject to the requirement that "such measures are not applied in a manner which would constitute a means of arbitrary or unjustifiable discrimination between countries where the same conditions prevail, or a disguised restriction on international trade."

Of all regulations, health and sanitary standards, by the very nature of their basic intent and purpose, are perhaps the least susceptible to valid criticism as trade barriers. However, differences in the requirements of nations, or the method by which a requirement is applied or administered, may cause problems for traders. Frequently a product meets domestic health and sanitation

requirements in the producing country but, upon exportation, fails to meet requirements of other countries. When this happens, exporters are prone to contend that the excluding requirement is either unnecessary or a disguised restriction on trade. On the other hand, many exporters complained when they encountered foreign regulations, inspections, testing or other requirements very similar, if not identical, to those to which imports into the United States are subject.

Some recent health measures have had a substantial commercial impact for the United States and other industrialized countries. Bans on the use of DDT and other chlorinated insecticides and on polychlorinated biphenyls provide examples. Years after an enormous commerce had been developed in these products the undesirable aspects of their persistent and widespread use came to be known, and controls began to be imposed upon their use and trade. After 1972, for example, general use of DDT on crops in the United States was banned. Certain public health and quarantine uses are still permitted, however, and there is no control upon exports for use in other countries. The spreading ban on imports of DDT among several countries gave rise to complaints by U.S. exporters in the Tariff Commission's survey of trade barriers. Some of these complaints charged that the ban had been imposed chiefly to promote the use of locally produced insecticides.

Member countries of the Organization for Economic Cooperation and Development, which includes most of the large industrialized nations,

recently agreed on stringent measures for concerted action to limit production and use of polychlorinated biphenyls. These substances, which have valuable dielectric and nonflammable properties, are also highly toxic and persistent, giving rise to serious environmental and health hazards. This type of agreement was considered a major step in international cooperation to reduce health hazards while avoiding adverse trade effects.

The health and sanitary regulations which were the subject of complaint in the Tariff Commission's survey of trade barriers principally concern the use of food additives, regulations governing meat, poultry, and seafood, and phytosanitary requirements for agricultural products. A number of complaints were registered against certain State and Federal regulations in the United States. The regulations of the major countries which drew complaints are summarized, by trade area or countries, on the following pages. The summaries appear in the approximate order of the number of complaints received.

European Community (of six) 1/

The establishment and enforcement of health and safety standards in the European Community remains largely the province and responsibility of individual member States. However, the Community's central

---

1/ On Jan. 1, 1973, the United Kingdom, Denmark, and Ireland joined the European Community, raising to nine the number of member countries. Most statistical and other data for this report have had to be assembled in terms of EC membership prior to enlargement. To provide comparability with other parts of the report, health and sanitary regulations in the Community are discussed in terms of the original six members only. Such regulations which have been in force in the United Kingdom, Denmark, and Ireland are discussed in a subsequent part of the report.

organization is working with member States to achieve a harmonization of standards in several areas, particularly when the operation of a standard may bear upon the free flow of commerce within the customs union. For example, all countries of the Community uniformly limit use of diphenyl as a chemical preservative for treating fresh fruit to 70 parts per million, which is a lower tolerance than is permitted in the United States and creates problems for marketing U.S. citrus fruits in the Community (see discussion in this chapter on labelling).

France.--As part of its public health program, France divides beverages into various groups for the regulation of advertising. Nonalcoholic beverages, fermented but nondistilled alcohols such as beer and wine, and rum, cognac, and similar alcohols may be advertised. The advertising of some sweet wines, wine liqueurs, and liqueurs of strawberries and raspberries is permitted with regulation. (For example, it is not permitted to advertise that such a drink is healthful.) It is forbidden to advertise whisky, vodka, bitters, anisette, and like beverages.

Purportedly, the reason for the prohibition is to discourage alcoholism by not advertising the beverages considered most likely to encourage its development. The United States and a number of other countries believe this ban discriminates against grain spirits and favors those spirits that are most generally produced domestically in France.

Response to the Tariff Commission questionnaires indicates that this regulation is considered a significant trade barrier. In 1972, exports of whisky from the United States to France amounted to approximately \$1 million. Respondents reported that an advertising campaign should increase this amount substantially.

France does not admit live and processed poultry from any country that does not forbid by law the feeding of estrogens, arsenicals, and antimonials to poultry. This regulation was reported to be an important barrier. It was estimated that annual U.S. exports to France could increase by \$500,000 if the restriction were removed.

Imports of horse and mule meat are prohibited, and imports of honey must be accompanied by a certificate indicating that the honey was produced in an area free of noseema, a disease of bees. No estimate of the impact of these regulations on trade was given by the respondents, but the effect on U.S. trade is probably not significant.

West Germany.--Only meat from processing plants which have been inspected by West German authorities is acceptable, and inspection requirements effectively prohibit exports from U.S. meat-packing plants. Inspection procedures often hamper or prevent importation of processed poultry and certain products containing pork; for example, the inspection procedure for controlling trichinae sometimes requires that a sample be taken from each slice of meat or from each prepacked commercial unit. Imports of pickles and

gherkins containing alum are prohibited. The use of sulfur dioxide as a preservative in treating fruit, such as raisins, is restricted. Postharvest treatment of apples and pears is not specifically permitted by West German regulations and, as a consequence, U.S. exports have been stopped. Pasteurized honey is not acceptable. Regulations specify a minimum content of diastase (an enzyme present in unpasteurized honey) and a maximum content of hydroxyme thylfurfurol (which is harmless according to the U.S. Food and Drug Administration). No phosphates are allowed in poultry products (most U.S. processors add phosphates in controlled amounts. The use of butylated hydroxyanisole (BHA) and butylated hydroxytoluene (BHT) as antioxidants is forbidden. West Germany quarantine provisions covering cut flowers are considered by U.S. shippers to be overly strict for minor diseases. Any mold or botrytis, which is very common, may lead to the destruction of the flowers, even if the ultimate destination is a country other than West Germany.

The West German regulations listed above were reported to have varying effects on trade. Those pertaining to poultry, beef, and pork were considered as important barriers; a small-to-moderate increase in U.S. exports to Germany was predicted if they were removed. In 1972, U.S. exports of poultry products (excluding livers) to West Germany amounted to about \$7.0 million; exports of beef (excluding livers and other offal) were valued at \$474,000. There were no exports of pork except for livers, other offal, and a small amount

of smoked and salted products. The value of livers and other offal exported was as follows:

Poultry liver-----	\$1,321,000
Beef liver-----	215,000
Pork liver-----	6,817,000
Other beef offal-----	43,000
Other pork offal-----	895,000

The prohibition against BHA and BHT was reported to be a significant barrier insofar as walnuts are concerned.

U.S. exports to West Germany of cut flowers and buds for ornamental purposes were valued at \$29,000 in 1972. One company in its reply to the survey estimated that its sales in West Germany could total about \$100,000 if the quarantine restrictions were removed. This company does not export to West Germany at present.

Italy.--The importation of meat and poultry is forbidden unless it can be certified that the animal was not fed estrogen. Citrus fruit cannot be imported if the presence of diphenyl, used as a preservative, exceeds a stipulated maximum level, although, according to one respondent to the survey, diphenyl in amounts above the maximum is used to preserve Italian fruit when it is exported. Dried fruit cannot be imported if the quantity of sulfur dioxide used for its preservation is greater than 600 parts per million.

The respondents could not estimate the amount that U.S. exports would increase if these regulations were alleviated. The only citrus fruit exported to Italy by the United States in 1972 was grapefruit. These exports amounted to \$357,000. Exports of poultry products in 1972 were valued at \$1,157,000.

It was also reported that Italy imposes a sanitation inspection fee of 3.6 cents per 100 pounds on imports of tallow. In 1972, the United States exported 95,326,000 pounds of tallow to Italy.

The Netherlands.--Imports of fruit juice drinks from the United States are frequently excluded because of a general prohibition against the addition of artificial colors to such drinks. Lemonade, flavored mineral waters, and other nonalcoholic beverages (except certain juices containing added sugar) are affected. Inspection certificates are required for upholstery fabrics, shoe dyes, and cosmetics. Advertising restrictions are also imposed against these commodities.

The effect of these restrictions was not quantified by the respondents.

European Free Trade Association (of eight) and Finland 1/

United Kingdom.--Imports of pork (excluding offal) from the United States are prohibited because hog cholera has not been eradicated in the United States. U.S. exports of pork to the United Kingdom would increase significantly if this restriction was alleviated.

Tobacco products may not contain any additives such as the flavoring used in U.S. cigarettes. This regulation limits U.S. exports to the United Kingdom, but respondents could not estimate the seriousness of the restriction.

---

1/ The discussion covers EFTA members at the time the Tariff Commission survey was made. On Jan. 1, 1973, the United Kingdom and Denmark terminated their association with the EFTA and became members of the European Community.

Benzoate of soda cannot be used as a preservative in canned vegetables and pickles. Ascorbic acid (vitamin C) normally used as a preservative of dried fruit, is banned. The use of BHA and BHT as antioxidants to maintain the stability and quality in shelled walnuts is prohibited, even though (according to one complainant) the studies in Australia on which the prohibition is based have been refuted and Australia is in the process of allowing the use of these antioxidants. A significant increase in exports was predicted if these regulations were changed.

The United Kingdom requires field inspection for phytosanitary certificates for pea, tomato, lettuce, and alfalfa seeds. The cost of the inspection substantially increases the export price of the seed. Imports of alfalfa seed, except seed grown in California, are prohibited for phytosanitary reasons. Imports of U.S. perennial ryegrass seed are forbidden for agronomic reasons; officials of the United Kingdom state that U.S. varieties are not adapted to conditions in that country.

The respondents estimated a significant increase in exports if these restrictions were removed. Exports of alfalfa seed to the United Kingdom in 1972 amounted to \$27,000. There were no exports of perennial ryegrass to the United Kingdom in 1972.

Sweden.--Imports of meat and edible offal of bovine and ovine animals are prohibited from countries where foot-and-mouth disease exists. Beef and beef products cannot be imported unless certification is made that the animals from which the meat is derived were not fed growth hormones. The United States cannot make this certification but argues that scientific

methods are accurate in determining whether intolerable hormone residues exist in meat. Processed poultry products are prohibited if they contain phosphates. Poultry may not be imported from countries that have Newcastle disease, which limits U.S. exports to Sweden to cooked poultry products.

Respondents to the survey indicated that these regulations are important trade barriers. It was estimated that poultry exports to Sweden would double if the standards were changed. No estimate was made of the effect on commodities other than poultry.

Denmark.--No raw poultry products are accepted. No phosphates are permitted in processed products. Health regulations apply to a large number of meat products, tallow, flour, meal, live cattle, sheep, and goats. A small increase in the value of U.S. exports to Denmark was predicted if the restrictions were removed.

Portugal.--Only olive, peanut, and corn germ oil are legally permitted as edible in Portugal. Soybean and cottonseed oil are authorized only for use as mixtures in manufacturing.

Other EFTA countries.--Switzerland does not permit sodium phosphate in processed turkey products nor caramel coloring in smoked turkeys. Austria, Finland, and Norway all maintain health and sanitary standards on imports of livestock, meat and meat products, and fruits and vegetables which are similar to those of the other EFTA countries described above, and which were also the subject of complaint.

United States

In the United States all imported foods are subject to inspection by the U.S. Food and Drug Administration (FDA) for wholesomeness and freedom from contamination at the time of entry, pursuant to the provisions of the Federal Food, Drug, and Cosmetic Act. Imports of meat, poultry, milk, and cream are covered by additional separate laws.

Under the Wholesome Meat Act of 1967, meat and poultry imported into the United States must originate in countries whose inspection programs have been found to be comparable to U.S. programs and are approved by the U.S. Department of Agriculture. Meat plants in foreign countries are, in effect, required to comply with U.S. standards in order to export to the United States. Many European companies feel that the standards expected of them are too high and will not update their plants, thus losing the right to export to the United States. Foreign producers of processed meat such as sausage, salami, and ham were specifically mentioned by importers submitting these complaints. This act was classified as an important barrier by the respondents, who also forecast a moderate increase in their imports if the barrier was removed. U.S. imports of all meats affected by the Wholesome Meat Act were valued at about \$1.2 billion in 1972. A moderate increase could be as much as 20 percent or \$200 million.

Importation of live cattle and swine, and fresh, chilled, or frozen meat of such animals is prohibited from countries in which the Secretary of Agriculture has determined that rinderpest or foot-and-mouth disease exists. Some U.S. importers contend that these

regulations are misused for protectionist purposes and cite the prohibition against imports of certain meat products from Sweden as an example. According to the respondents, imports from Sweden were prohibited in the 1960's because of an outbreak of foot-and-mouth disease in that country, and, although there has been no incidence of this disease reported since 1966, fresh and frozen meats from Sweden are still excluded. These regulations are considered to be important barriers by traders. A moderate increase in imports was predicted if the barriers were removed.

Milk and cream may only be imported under permits issued to individual foreign plants which have fulfilled certain sanitary prerequisites. Each permit identifies what product may be imported from the specified foreign producer. Importers of products affected feel the requirements are unnecessarily restrictive and estimated that annual imports would increase by about \$1.5 million if the system was moderated.

Live poultry which has been imported from any country except Canada must remain in quarantine for 21 days. Also, the imports must be accompanied by a certificate from a veterinarian in the country of origin indicating that the poultry is free from communicable poultry disease and that it has been in the country since hatching or for 60 days prior to exportation. All poultry products must be inspected for fitness for human consumption.

Respondents characterized the regulations governing poultry as nuisances rather than important trade barriers, stating that moderation of the regulations would probably not lead to an increase in imports but would facilitate trade. The U.S. prohibition against the importation of psittacine birds because of disease was similarly reported.

The State of Maryland prohibits the sale of foodstuffs containing shellfish unless such fish have been certified to be free of pollution under procedures approved by the U.S. Public Health Service, even though the imported items have been inspected and approved on entry by the FDA. The complainants consider the Maryland certification standards to be discriminatory in intent and assert that they virtually preclude the sale of imported products containing shellfish in the State of Maryland. The respondents gave no estimate of the value of trade lost because of these regulations.

Nations have developed different analytical techniques for determining the content of mercury and pesticide residue in fish and seafood. The present U.S. mercury guideline differs from that of most other fish-consuming nations, and, as a result, products acceptable throughout most of the world are not eligible for importation into the United States. Trade has been restricted in three major species of fish (swordfish, whitefish, and tuna) by this standard. The loss in imports of swordfish is reported to amount to about \$12 million annually, and in imports of whitefish from Canada, to about \$1 million. Restrictions on tuna have been made less burdensome by use of testing procedures on board fishing vessels.

Similarly, U.S. standards on pesticide residue, not agreed to by other health authorities, have impeded the movement into this country of

such products as frogs' legs. The FDA was criticized by respondents for stopping the importation of frogs' legs because of the content of Lindane (BHC), a pesticide, before the laboratory analysis technique was perfected. This restriction has now been removed.

U.S. standards for chocolate differ from those in most other countries. Foreign producers report that U.S. standards require a higher proportion of butterfat to nonfat milk solids than is normally found in whole milk.

The State of California requires that flour must be enriched with niacin. This regulation exceeds the requirements of the FDA and forces exporters to the United States to either withdraw from the California market or use only enriched flour for the whole U.S. market.

The U.S. phytosanitary regulations applicable to fresh fruits and vegetables, plants, and certain plant materials are a frequent cause of complaint by foreign governments and exporters to the United States.

The United States prohibits the use of certain fungicides and pesticides that were used by domestic flower growers as recently as 2 years ago. Local growers complained that they are at a competitive disadvantage because they must now use controls that are more expensive and less effective while foreign producers continue to use the banned chemicals.

#### Japan

Japanese agencies comparable to the U.S. Food and Drug Administration will not accept approval by that organization as a criterion for admission

of many products. The use of food additives such as ascorbic acid, sodium benzoate, calcium acetate, calcium stearate, and ethylenediaminetetraacetic acid is prohibited. Limitations are in effect on the amount of butylhydroxyanisole and dibutylhydroxytoluene (used to prevent oxidization of vegetable margarine) and sulfurous acid (used to decolorize fruit before artificial coloring) permitted in a product. Products such as fruitcakes, cheesecakes, pickles, gherkins, diet spread, and instant pudding are affected by these restrictions. According to one official of the U.S. Embassy in Tokyo, the Japanese restrictions on food additives differ entirely from those of the United States and many European countries.

An example of the difficulties encountered in shipping to Japan was cited by a U.S. producer of fruitcakes. A shipment of 400 fruitcakes was denied entry into Japan because a solution of one-tenth of 1 percent of benzoate of soda had been used in the glaze on top of each cake. The shipment was finally donated to a U.S. military hospital in Japan because no agreement could be made for its admittance. Attempts to have bulk shipments of cakes cleared through the inspection of samples submitted prior to exportation from the United States were unsuccessful. The Japanese insisted that each shipment would have to be examined and judged separately.

Japan maintains a number of special provisions regulating the importation of seeds for planting purposes. U.S. Government export certificates are required. If inspection on arrival reveals infection with any of a certain group of diseases, importation is refused. Seeds slightly

infected with another group of pathogens may be certified but with a declaration as to their presence. Seeds in this group are subject to inspection and treatment on arrival.

Japan enforces an embargo on walnuts in the shell grown in the United States for the declared purpose of preventing infestation by the husk fly. However, according to the complainant, the husk fly can be carried in shelled walnuts as easily as in unshelled walnuts.

The companies citing the Japanese regulations on seeds and walnuts considered them to be significant barriers to trade and estimated a moderate increase in exports to Japan if the restrictions on seeds were removed and a significant increase if the embargo on walnuts was removed. Exports of grass, flower, and vegetable seeds to Japan in 1972 were valued at almost \$4.1 million. A moderate increase could mean as much as an additional \$1 million. No walnuts in the shell were shipped to Japan from the United States in 1972.

#### Australia

Numerous health and sanitary regulations of Australia were cited. Hop cones must be certified as coming from a country where downy mildew does not exist. Margarine must be colored pink. Alum cannot be used in pickles. Imports of live animals, birds, and poultry; fresh, chilled, or frozen meat of bovines, sheep, goats, pigs, horses, asses, poultry, and edible offal; and dried, smoked or salted bacon, ham, meat, and offal are generally prohibited except from New Zealand and, regarding horses and rabbits, from Ireland and the United Kingdom. Canned poultry products

must be certified as having been cooked at not less than 100° centigrade, and the cooking time and temperature must be recorded on the certificate. Some grains, fresh fruits, and vegetables are prohibited. Australia does not accept U.S. Food and Drug Administration approval as a criterion for the admission of many products.

One of the most complicated Australian regulations is the quarantine restriction on horses. Horses destined for Australia must first be shipped to Great Britain or Ireland, remain there continuously for 6 months immediately prior to transshipment, then be shipped on a vessel that does not stop at any port in the continents of Africa, South America, Central America, or in any of 11 countries outside these areas (including the United States), nor may it pass through the Suez or Panama Canals. After arrival the horse is quarantined for 14 days before being admitted to the country. The procedure consumes about 9 months and results in the loss of a year in breeding time.

Australian quarantine regulations prevent the importation of alfalfa seed from the United States because this seed can carry "bacterial wilt," a disease which the complainant states is already prevalent in certain areas of Australia. For bean seeds a field inspection phytosanitary certificate is required from the State of Idaho and also, if grown in California, from Monterey County. Importation of bean seeds from any other county in California and any other U.S. State is prohibited. The quarantine regulations also prohibit the importation of corn and sorghum seed, and tomato and other crop seeds, and limit the amount of dirt in any one sample.

The organizations reporting Australian regulations considered them important trade barriers but in most instances were not able to supply estimates of the amount by which trade would increase if the regulations were moderated or removed.

#### Canada

To protect the public health, safety, and welfare, Canada maintains regulations applicable to forest products, drugs, insecticides, cosmetics, fertilizers, and upholstery that are similar to U.S. regulations for these products. Imported meat and offal of horses, bovine cattle, pigs, sheep, goats, and poultry must comply with the provisions of the Canadian Animal Disease and Meat Inspection Act. Bulbs, tubers, and other live plants must conform to the requirements of the Insect and Pest Act.

The effect of these regulations on trade was declared to be significant by the respondents, although they gave no estimate of the value of trade lost.

#### New Zealand

New Zealand has the same regulations governing the importation of horses as Australia (described above). Health and sanitary regulations are also imposed on other live animals and poultry; the meat and offal of bovines, sheep, goats, swine, horses, mules, asses, hinnies, poultry, and byproducts of such meat and offal; brush bristles; eggs; horse-hair; fish waste; bulbs, tubers, shrubs, trees, and cut flowers; oil-seeds, copra, soybeans, and flour and meal of oilseeds and oleaginous fruits; and many other agricultural products.

New Zealand quarantine regulations require certification that imported seed and wheat were produced in an area not infected by foot-and-mouth disease, black tongue, and swine fever. An embargo is maintained on all seed corn from the United States because of southern leaf blight. Several crops, including beans, beets and cucurbits, require field inspection phytosanitary certificates. Although these regulations are considered significant trade restrictions, the respondents gave no estimates of the value of increased trade anticipated if the regulations were modified.

#### Other countries

The Commission received numerous complaints against health and sanitary requirements maintained by a large number of developing countries plus South Africa and Ireland. The complaints were generally similar to those already discussed for the major developed countries; for example, many Latin American countries require that sanitary certificates accompany imports of canned foodstuffs. Numerous countries also require the sanitary registration of canned foodstuffs, which often results in exorbitant laboratory fees. These regulations were considered to have no value insofar as protecting the consumer and were considered a nuisance by the respondents.

It was reported that the appropriate administrative mechanism does not exist in the United States which would enable U.S. exports to meet the foreign requirements. For example, Malaysia requires a special health certification for poultry which the U.S. Department of Agriculture inspection service is not empowered to give. An increase

of \$400,000 per year in poultry exports to Malaysia was forecast if the regulations were modified. Similarly, Malta requires certification that poultry was free from Newcastle disease for 3 months prior to slaughter, but the U.S. Department of Agriculture is unable to make this certification. A \$10,000 increase in exports of poultry to Malta was estimated if the requirement was changed.

## Pharmaceutical and Veterinary Standards

Regulations requiring testing, plant inspection, special documentation, and the use of a specific pharmacopoeia constitute the bulk of the pharmaceutical and veterinary standards reported as trade barriers. Many of the regulations, especially those requiring testing, were cited as causing unreasonable delay and expense in completing transactions, thus increasing the cost of the merchandise. A few pharmaceutical standards were cited as significantly reducing trade rather than merely slowing it. Prepared and packaged pharmaceutical products are generally more affected by the restrictions than bulk preparations. Although U.S. export and import statistics for these products are not strictly comparable, they do indicate that U.S. exports are somewhat greater than imports. In 1972, for example, U.S. exports of prepared products were valued at about \$235 million and imports, at about \$36 million. In the same year, exports of bulk products amounted to about \$360 million, imports, to about \$205 million.

Complaints received in the Commission's investigation involved the regulations of almost all developed countries and more than 14 developing nations. Roughly two-thirds of the complaints were against developed countries. The more significant complaints are summarized below, arranged by country against which the complaint was directed.

### Belgium, the Netherlands, and Luxembourg

Pharmaceutical standards of Belgium and the Netherlands do not always recognize the validity of U.S. Food and Drug Administration

tests, and drug manufacturers shipping to the Benelux countries are frequently forced to duplicate tests already performed in the exporting country. Both Belgium and the Netherlands often reject products that have been approved for sale by the FDA, thus limiting the products that can be sold in those countries. One respondent asserts that Belgian and Netherlands producers are granted their Governments' Board of Health approval more quickly than foreign firms, a fact which acts as a further deterrent to trade. In addition, it was reported that Belgium and Luxembourg maintain general regulations which specify testing, purity controls, marking, and the prohibition of certain additives, and the Netherlands imposes advertising restrictions and requires certificates of inspection.

A significant increase in exports was predicted if these barriers were removed. One firm predicted an increase of \$1 million in sales for its products.

#### Finland and Sweden

Pharmaceuticals may be imported into Finland and Sweden only by approved druggists, drug wholesalers, or manufacturers.

#### France

Before being permitted to sell finished pharmaceutical goods of foreign manufacture in France, a company must obtain a visa document giving formal approval of the content, therapeutic properties, method of manufacture, quality control, packaging, and labelling of

the product. In addition, an authorization of sale must be obtained from a French Government inspector attesting that the specifications of the visa were adhered to. However, this authorization cannot be obtained unless French sanitary regulations are complied with. These regulations require pharmaceuticals to be manufactured under the supervision and control of French pharmacists and French public health inspectors. Foreign firms cannot meet these requirements; therefore, they cannot obtain an authorization of sale and imports are precluded.

The organizations reporting this barrier predicted a significant increase in exports to France if this restriction was removed. One company estimated that the value of its exports would increase by \$2 million.

#### Italy

Foreign tests are not recognized by the Italian control board.

#### Japan

The chief complaint with respect to Japanese regulations concerned differences in U.S. and Japanese testing requirements for new pharmaceutical products and the fact that Japan does not automatically accept products which already have U.S. Food and Drug Administration approval without further testing.

#### United States

Complaints against several U.S. requirements were received from both U.S. and foreign firms. The most significant of these requirements

are listed below.

- (1) Compulsory inspection of plants in the country of exportation by U.S. inspectors.
- (2) Repetition in the United States of research and additional tests (clinical trials).
- (3) Requirement by the U.S. Comprehensive Drug Abuse Prevention and Control Act (Public Law 91-513) that authenticated documents from a foreign importer's home office be accepted by the U.S. Bureau of Narcotics and Dangerous Drugs before certain substances and preparations can be exported from the United States, even for items not controlled in the country of importation. (One company reported delays of up to 3 weeks before Customs would release the consignments for export.)
- (4) Approval of pharmaceuticals by the FDA before they can be shipped to the United States. Batches of material must be held until the FDA has approved a sample. Although the material may meet pharmaceutical standards in the producing country, the FDA may reject it, making it necessary to produce new batches of material which are then subject to the same approval procedure. This procedure can be costly when material with no other outlet than the United States is involved.

According to the respondents, modification of the pharmaceutical regulations listed above would not lead to an increase in trade but would reduce the costs and time involved in each transaction.

#### Developing countries

Just as in the developed countries, regulations on pharmaceutical trade and commerce are widespread among the developing nations. Many regulations are common to a number of nations, but not to all. Among these are use of a designated language 1/ for all documen-

---

1/ Frequently, but not always, the native language of the importing country. Many African countries (especially former French colonies) designate French.

tation; conformance to one or more of the following as the legal standard in a particular country--the French, British, or Portuguese Pharmacopoeia, the British Pharmaceutical Codex, and the British Veterinary Codes; certification; restrictions on the distributors that may be used.

Some form of governmental approval is frequently required for imports, and complaints were received that such approval cannot be obtained in some countries when a similar product is already available in the country. Many countries require a local analysis of the product. India, for example, requires that all patent and proprietary medicines be analyzed, registered, and certified. Controls on advertising, sales, and pricing found in several countries are said to discriminate against imports, or at least imports from certain sources. In Nigeria, products conforming to the British Pharmacopoeia or British Pharmaceutical Code, and so labelled, enter free; products conforming to the U.S. Pharmacopoeia but not meeting the foregoing requirement pay 20-percent duty.

## Chapter XI

### CUSTOMS PROCEDURES AND ADMINISTRATIVE PRACTICES

#### Introduction

This chapter is concerned with administrative procedures and customs matters, other than rates of duty, which may impinge upon the free flow of trade. These include tariff nomenclatures or classification systems, customs valuation, documentation requirements, consular formalities, antidumping practices, and other governmental regulations and administrative practices which attend the shipment of goods across international frontiers. Some of these, such as customs valuation and tariff nomenclature, are so intimately involved in the determination of the amount of customs duty to be collected that perhaps they should be regarded more properly as tariff barriers, rather than "nontariff" trade barriers. Nevertheless, in discussions in the GATT, the OECD, UNCTAD, and other organizations dealing with international trade, chiefly as a matter of convenience the practice has developed over the past several years of classifying as "nontariff" all measures affecting trade other than tariff rates themselves, regardless of any connection that may exist with the application of rates of duty.

Overly complex or strict customs procedures, regulations, and administrative practices are universally regarded by traders as a serious restraint upon their operations. Some tariff nomenclatures and valuation

systems have been criticized as unreasonably complex and difficult to interpret, and hence creating uncertainty for the trader as to the ultimate cost of importing a product. Similar uncertainty is said to arise also from the fact that in some countries customs officials have broad administrative discretion with respect to customs classification and valuation for duty and tax purposes. Such uncertainty is widely considered to constitute a significant barrier to trade. Administrative procedures, such as documentation requirements and consular formalities, often involve substantial costs for the trader.

A summarization of complaints involving customs procedures and administrative practices which were submitted in the Tariff Commission's survey of trade barriers is shown in table 11-A. About one-third of the complaints were concerned with customs valuation practices, one-fourth with documentation requirements. None of the other categories of problems shown in the table drew more than 10 percent of the total complaints.

Table 11-A.--Summary count of complaints made against customs procedures and administrative practices

Type of practice	Number of complaints			Total
	against--			
	Developed:	LDC's	Communist:	
	countries:	countries:	countries:	
1. Customs valuation-----	101	66	2	169
2. Documentation requirements-----	55	77	-	132
3. Regulations on samples, returned goods and reexports-----	29	27	-	56
4. Consular formalities-----	1	49	-	50
5. Administrative difficulties-----	22	21	-	43
6. Classification of merchandise-----	28	8	-	36

Table 11-B shows the distribution of the complaints by country. About 52 percent of the complaints dealt with practices in developed countries. The United States was the object of 19 percent of the total number of complaints, and 37 percent of those against developed nations. The European Community (of six) received about 8 percent of the total complaints. The remainder were widely scattered among a large number of countries. Valuation practices were the principal concern in developed nations; for less developed countries, documentation requirements cover a slightly larger volume of complaints than valuation problems.

Table 11-C shows the distribution of the complaints by product sector. As would be expected when dealing with practices which tend to be applicable to products generally across the board, the distribution of the complaints among product sectors conforms fairly closely to the trade importance of the sectors. However, one sector--chemicals--conspicuously deviated from this pattern. The unusually large number of complaints dealing with chemical products reflected concern with documentation requirements and regulations on samples for pharmaceuticals and drugs maintained by many countries and certain customs valuation practices of the United States.

Perhaps because the matters dealt with in this chapter are so directly and intimately connected with the conduct of trade, they long ago came under the close scrutiny of individuals, organizations, and governments concerned with the removal of obstructions to the international exchange of goods. In the 1920's, for example, proposals were made in the

League of Nations for common international systems for customs nomenclature and valuation with a view to lessening disputes and delays over these matters. Since World War II, many countries have worked both collectively and individually to improve government administrative procedures affecting trade in order to minimize the inconvenience and cost of these procedures for traders. In the Commission's survey of trade barriers, customs procedures and administrative practices were named in about 12 percent of the complaints.

Customs Valuation 1/

A customs valuation system is an integral part of the tariff mechanism of every country employing ad valorem rates of duty or otherwise determining duty collections according to the value of imported merchandise. The value assigned to imported merchandise is critical in determining the amount of customs duty to be paid on goods subject to ad valorem tariff rates or on goods for which a specific duty varies with the value of the goods. In these cases, the system by which goods are valued maybe equally as important as the tariff rate itself in the calculation of the amount of duty to be collected, and in some instances the valuation method is of greater concern to the importer than the nominal tariff rate which is ultimately applied.

In spite of this critical role in determining the amount of customs duty which will be collected, some aspects of customs valuation systems have come to be characterized and discussed internationally as "nontariff" trade barriers. This has been the case particularly where traders consider the customs value of their merchandise to be determined arbitrarily or without regard to the price actually paid for the goods, or where they

---

1/ The Tariff Commission, in January 1973, submitted a report, entitled "Customs Valuation", to the Committee on Finance, U.S. Senate. That report, published in March 1973, contains a detailed description of the valuation systems of the United States and its principal trading partners; and the report deals with the "trade barrier" aspect of customs valuation principally in terms of the "fairness" of valuation systems to all classes of shippers in international trade.

The present discussion is confined to a consideration of the aspects of customs valuation which have been criticized as constituting trade barriers. The reader should refer to the March 1973 report for a more complete technical description of the valuation practices which are discussed in the following pages.

find a country's valuation system unusually difficult to understand and comply with because of its complexity or its administration. The majority of complaints which have been leveled against customs valuation practices, however, are found, in ultimate analysis, to be chiefly concerned with the effect which the practice has on the amount of duty collected.

#### International rules for customs valuation

Ambiguous or arbitrary customs valuation systems which restrain trade became a matter of concern to governments as long ago as the early part of the present century. The need for international standards of customs valuation was voiced by several countries in the early 1920's. The subject was considered at the League of Nations Economic Conferences held in 1927 and 1930, where participants agreed on the need for action, but none resulted at that time. The General Agreement on Tariffs and Trade, drafted in 1947, included broad principles of customs valuation to be followed by contracting parties, but left each country rather wide discretion in formulating national standards which would comply with the general principles. In mid-1949, the European Customs Union Study Group completed a comprehensive customs valuation standard which was set out in an international convention, entitled the Convention on the Valuation of Goods for Customs Purposes and commonly referred to as the Brussels Definition of Value. As a point of departure for their work, the Study Group built upon the valuation provisions of the Havana Charter for an International Trade Organization and agreed that the standard to be

developed should comply with the provisions on customs valuation contained in the GATT, which had just been formulated.

Countries adhering to the Brussels Valuation Convention agree to incorporate the Brussels Definition into their customs laws. At the close of 1973, 26 countries (including most of Western Europe and Japan) were contracting parties to the Convention, and an additional 58 countries nominally applied the Brussels Definition of Value without being members of the Valuation Convention. The member countries alone accounted for 57 percent of free world imports in 1970. The United States, Canada, Australia, New Zealand, and South Africa are the principal market-economy developed countries which do not use the Brussels Definition.

The international recognition of general principles of customs valuation in the GATT, and the adoption by a very large number of countries of a common valuation system (through use of the Brussels Definition) provide the background against which valuation practices which have been criticized as constituting trade barriers should be examined. There appears to be a consensus among the various groups concerned with tariffs that, to the maximum extent possible, customs valuation should, inter-alia, be uniform and impartial with respect to products and suppliers, be based on commercial values in competitive transactions, and be based on simple principles which, in application, have easily predictable results. An additional premise which frequently underlies international consideration of customs valuation (although not always explicitly stated) is that insofar as possible the valuation system should be a "neutral" factor in determining the amount of duty to be collected and should not be devised

to provide tariff protection to domestic industries, that function being relegated exclusively to the rate of duty.

Some of the valuation practices which have been criticized as constituting barriers to trade contravene one or more of these general principles. However, many complaints have arisen simply because the criticized practice differs from a procedure (usually that of the complainant's country) which is more familiar to the complainant.

#### A summary comparison of valuation practices

In the following paragraphs some of the most salient features of the customs valuation systems in selected countries are described very briefly to the limited extent necessary to provide the conceptual framework for considering the complaints raised in this area.

The Brussels Definition of Value <sup>1/</sup>.--Under the Brussels Valuation System, the customs value of imported goods is their "normal price", which is defined as the price the goods would fetch, delivered to the buyer at the place of importation, at the time the import duty becomes payable, on a sale in the open market between a buyer and seller independent of each other.

The Brussels Definition thus is a notional concept of valuation, i.e., the value to be determined is the price the goods would command if sold in accordance with specified terms. It is also a single standard applicable to all goods, irrespective of whether the goods were actually

---

<sup>1/</sup> The Brussels Definition of Value is applied under international convention by 17 countries in Europe, Japan and 8 other non-European countries. In addition, it is nominally applied by several countries which are not parties to the Valuation Convention. These include 26 countries in Africa, 19 countries in the Americas, 6 in Europe, 6 in Asia, and one small country in Australasia.

traded in accordance with the specified terms. And finally, the customs value of the goods is to be the value at the place of importation, including all expenses incidental to delivery of the goods to that place (in other words, loosely speaking, the c.i.f. value 1/).

The Brussels Definition is exceedingly simple in its statement of principle, but admittedly less simple in application. The main difficulty is determining values for goods sold on terms other than those specified for the "normal price" concept, and especially for non-arms-length transactions. Nevertheless, for the majority of imports, the c.i.f. transaction price (sometimes adjusted on the basis of information readily available to customs officials) constitutes the usual basis for the assesment of duty.

Other systems.--Most nations not employing the Brussels Definition of Value have "positive"--in contrast to the Brussels "notional"--customs valuation systems. A positive customs valuation system defines value in terms of the price at which, and the conditions under which, goods are actually sold. Consequently, positive valuation systems require, in ranking order, two or more standards to provide alternatives for valuation when the actual conditions of the next higher ranking standard are not met.

---

1/ In general, a c.i.f. price includes the cost of the goods, marine or other freight insurance, and all transportation charges to the point of destination; hence, the term c.i.f.--cost, insurance, and freight.

All of the major market-economy developed countries which do not use the Brussels Definition of Value <sup>1/</sup> have a second major difference with the Brussels system in that the generally preferred value for customs purposes is the value in the country of exportation, exclusive of transportation and other charges (loosely speaking, the f.o.b. value), rather than the value at the point of importation.

In several countries, and particularly developing nations, customs duties are assessed upon values calculated from "official prices" or "minimum prices" determined by the government.

Australian customs valuation.--Australia bases dutiable value on the higher of (1) the actual f.o.b. transaction price adjusted to disallow any special discount, or (2) "current domestic value," i.e., the value of identical goods sold for domestic consumption in the country of export plus all charges for placing the goods free on board at the port of export. If the goods are not sold for consumption in the exporting country, or are sold only to exclusive agents, or are imported under any other unusual circumstances, the dutiable value is determined at the discretion of customs officials. Most Australian imports are valued on the basis of current domestic value.

For certain imported products which are also made in Australia, if the landed, duty-paid cost of the imported item is less than the established "support value," there is levied an additional duty equal to 90 percent of the difference between the landed value and the support price.

---

<sup>1/</sup> The United States, Canada, Australia, New Zealand, and South Africa.

Canadian customs valuation.--The basic value for calculation of duty in Canada is the "fair market value" of the imported goods in the exporter's country. If fair market value cannot be determined (e.g., like goods are not sold for consumption in the country of origin), then dutiable value is based on the cost of production of the imported goods plus an allowance for gross profit. Under certain circumstances government officials may prescribe the manner in which dutiable value is to be determined.1/

U.S. customs valuation.--The Tariff Act of 1930, as Amended, provides nine standards for the customs valuation of goods imported into the United States. For the great bulk of imports, duties are assessed on the "export value" in the country of origin; when this is not appropriate, these products are assessed on the "United States value"2/ or "constructed value."3/ Four categories of products (benzenoid chemicals, certain rubber-soled footwear, wool knit gloves valued under \$1.76 per dozen, and certain canned clams) are valued for customs purposes on the basis of the selling price of competitive U.S. products (the "American selling price"). Somewhat different valuation standards are used for 1,015 articles (which have come to be referred to as the "Final List"). 4/ One significant

---

1/ Circumstances in which the regular valuation procedures may be inappropriate include the following: The imported goods are intended for packaging, assembly, or further manufacture in Canada; are obsolete or not new; are not of prime quality; or constitute job lots.

2/ The price at which the product is sold in the United States, less transportation costs, duties, and certain other expenses.

3/ Cost of production, plus producer's profit, plus packing for shipment to the United States.

4/ The United States adopted new valuation standards in 1956. At that time, a list of products was compiled for which the new standards would have meant a reduction of 5 percent or more in the appraised value. For these articles, the old valuation standards were retained. The list of articles is referred to as the "Final List."

difference in the standards applicable to these products is that the primary value to be used is "foreign value" <sup>1/</sup> or "export value," whichever is higher. The Final List also contains many benzenoid chemicals subject to valuation on the basis of an American selling price standard which differs in minor respects from that standard as applied to goods not on the Final List.

Complaints against foreign  
customs valuation

By far the most numerous complaint against customs valuation received by the Tariff Commission in its survey of trade barriers came from U.S. exporters who objected to the prevalent use of c.i.f. values as the basis of customs valuation in most countries of the world. Because U.S. import duties are, for the most part, levied on an f.o.b. basis, U.S. producers and exporters apparently look upon assessment on the c.i.f. value in other countries as inherently unfair.

Several countries assess duties on the "domestic value" of merchandise in the country of origin if it is higher than the invoice value for the imports being considered. This practice drew several complaints, but principally against Canada, Australia, New Zealand and South Africa.

A large number of countries (virtually all were developing nations) were criticized for using "arbitrary" values for the assessment of duties. Several of these use "official values" set by government officials, rather than some form of commercial value, for customs valuation purposes. Particularly singled out for criticism in this respect were Mexico, Brazil, and Argentina.

---

<sup>1/</sup> The price at which the article is offered to all purchasers in wholesale quantities for consumption in the exporting country.

A problem in virtually all valuation systems is establishing a correct customs value for imports which are not shipped as arms-length transactions between independent unrelated parties. Most countries adjust upward the invoice values of such import shipments to establish the customs value. As multinational corporations and exclusive distributorships spread around the world, problems arising from non-arms-length transactions multiply. The upward adjustment of invoice values for customs purposes in non-arms-length transactions is commonly referred to as "uplift," especially in countries using the Brussels Definition of Value. Japan, the United Kingdom, France, and Italy were particularly mentioned in complaints to the Commission concerning uplift procedures in customs valuation. The difficulties are mostly attributable to the inability to use real costs (as opposed to arbitrary costs) in making the adjustments, insufficient explanations offered concerning the bases for the uplifts, and the delays generally incurred in the processing of such entries.

Complaints against  
U.S. customs valuation

Over the past 25 years, complaints against certain aspects of U.S. customs valuation practices have become some of the most common complaints heard in discussions of trade barriers. The primary target has been the American selling price (ASP) valuation standard. In the world of trade and trade barriers, probably very few practices of any government have received the publicity poured upon the ASP system by trading partners of the United States. ASP has been widely characterized as one of the most important barriers to trade maintained by the United States, even though ASP applies to less than 1 percent of U.S. imports.

The American selling price.--The ASP system is criticized chiefly because it usually results in the collection of a substantially larger amount of duty than would be collected if the actual value of the imported goods were used.<sup>1/</sup> Foreign exporters also maintain that because they have no control over changes in the American selling price (which affect the amount of duty which will be collected), they are faced with significant uncertainties as to the ultimate cost of placing their goods on the U.S. market. An additional complaint is that administration of the provision is complex and frequently accompanied by long delays in customs clearance of merchandise and in the determination of the actual amount of duty to be paid.

The ASP system was first utilized by the United States in the Tariff Act of 1922 and was continued in the Tariff Act of 1930. The General Agreement on Tariffs and Trade was formulated in 1947, and the collection of import duties based upon the value of merchandise of national origin rather than upon the actual value of the imported merchandise violates Article VII of that agreement. However, since the ASP system was being applied when the United States acceded to the GATT, continuance of the

---

<sup>1/</sup> In a Tariff Commission study of ASP imports in 1964, ad valorem equivalents (based on normal customs valuation) were calculated for duties collected under the ASP system. It was found in that study that for some categories of benzenoid chemicals, for example, an ASP rate of 20 percent collected duties ranging up to 58 percent of the actual value of the imports; and ASP rates of 25 and 40 percent were equivalent to 112 and 172 percent, respectively. The 20 percent ASP rate on footwear was found to be equivalent, on the average, to 58 percent based on normal valuation.

Virtually all rates on benzenoid chemicals were reduced by 50 percent in the Kennedy Round; however, no reduction was made in the rate applicable to ASP footwear.

In 1971, for some benzenoid chemicals the equivalents of the ASP duties collected ranged well above 200 percent; for footwear, as high as 98 percent.

system is permissible under the Protocol of Provisional Application of the GATT.

Four categories of products (benzenoid chemicals, certain rubber-soled footwear, certain canned clams, and low-valued wool knit gloves), which together account for less than one percent of total U.S. imports, are subject to ASP valuation.

The reported dutiable value of 1972 imports of these products was \$463 million. Benzenoid chemicals made up 86.6 percent of this amount; footwear, 12.5 percent; and canned clams, 0.7 percent.<sup>1/</sup>

Imports of benzenoid chemicals accounted for about 19 percent of the total value of U.S. chemical imports in 1972; ASP footwear for 2.7 percent of the total value of all imported footwear; and ASP clams for less than 0.3 percent of total fish imports.

Not all of the imports covered by the ASP tariff provisions actually pay duties on the American selling price value. If, at the time of importation, an article is found not to be competitive with a U.S. product, the duties are assessed according to the other valuation standards in the U.S. system. Under this rule, in 1972, only 59 percent of benzenoid chemical imports and 41 percent of ASP footwear imports were found to be competitive and assessed duties on ASP values.

Data on the probable economic effect of elimination of the ASP standard are found in the Tariff Commission's March 1973 report on customs valuation.<sup>2/</sup>

---

<sup>1/</sup> The price bracket of wool knit gloves subject to ASP has been below actual price levels for several years. Consequently, no imports occur in this category.

<sup>2/</sup> Customs Valuation: Report of the U.S. Tariff Commission to the Committee on Finance and the Subcommittee on International Trade, United States Senate, 1973.

The Final List.--Aside from the ASP standard, traders level a more general complaint against the U.S. customs valuation system: that is the complexity of a system having nine specific detailed standards, each ranked in the order of precedence for application, but varying with the type of merchandise. The U.S. valuation provisions probably owe their complexity and detail in part to an effort by the drafters of those provisions to preclude arbitrary valuation by customs officials and insure fairness for all parties. Importers and foreign shippers contend, however, that because of this complexity, only experts with comprehensive knowledge of the system can predict with sufficient confidence the results of application of the system to a particular shipment of goods. The so-called "Final List" provisions account for a good part of the complexity of the U.S. valuation system.

The Final List was established in the Customs Simplification Act of 1956. In 1954, the President proposed to the Congress a substantial simplification of the U.S. customs valuation system contained in the Tariff Act of 1930 which had been found to present a large number of significant administrative problems. A study of the proposed bill revealed that a slightly lower valuation would result from application of the simplified standards, that the amount of the decrease varied considerably among products, and that in some cases it was substantial. To avoid an excessive drop in valuation of any product, the bill was redrafted to separate such products from the main body of imports and retain the then-existing provisions for use solely in valuing such commodities. It was

proposed that a list be published identifying all products for which appraised values under the new standards would be at least five percent lower than under the old standards, and for such products the old standards would be retained. Recognizing that such a list would have only transient validity because of constant changes in economic conditions and resultant price changes, it was further proposed to revise the list annually subject to Congressional approval, and that if after compilation of the fourth list Congress did not take action to provide otherwise, the new simplified standards would become applicable to all products. However, as finally enacted, the Customs Simplification Act provided for the compilation of only one list to be known as the Final List. In determining the products to be on the list, the five percent value difference was to be determined on the basis of comparisons of shipments imported during fiscal 1954. The Final List continued the old valuation provisions for these products, and consequently all of the administrative problems associated with them. 1/

Final List products have been estimated to account for 14 percent of the total value of U.S. imports in a recent year. However, about 40 percent of these imports now enter free of duty.2/ Data on the probable economic effects of elimination of the Final List are found in the Tariff Commission's 1973 report on customs valuation. 3/

---

1/ One significant aspect of the Final List valuation standards is that the primary value to be used is "foreign value" or "export value," whichever is higher.

2/ The duty-free imports consist principally of automotive products from Canada and books. Originally all merchandise on the Final List was subject to an ad valorem rate. Since its enactment, however, automotive products from Canada have been made free of duty under terms of the U.S.-Canadian Automotive Products Agreement and books have become free of duty under the Florence Agreement.

## Documentation Requirements and Consular Formalities

Every country requires some form of documentation to be submitted to government authorities on products crossing its borders. A diversity of needs give rise to these requirements. The simplest may be to permit the compilation of commercial statistics on the country's foreign trade. A common purpose is to provide information necessary for the determination of import duties. Another common purpose is for governmental regulation or control of foreign trade, including its amount, composition, and origin or destination.

A serious detriment to trade is recognized to exist in the cost of complying with documentation requirements which are excessive in terms of quantity, complexity, formality, and the time consuming procedures associated with obtaining or clearing the documents with the appropriate authorities.

A study of documentation problems in international trade was recently conducted by the National Committee on International Trade Documentation (NCITD) and the U.S. Department of Transportation. The study found that an average international shipment requires 46 different documents in about 360 copies and consuming 64 hours of preparation and processing time. Therefore, considering one year's commerce in U.S. international trade with 10 million export shipments and 8 million import shipments, a total of 828 million documents, 6-1/2 billion copies and more than a billion man-hours of workload is generated.

The NCITD study calculated the cost of preparing documentation required by several countries. An outstanding example of costliness was the Poliza de Consumo demanded by Peru. The documentation study reckons that, at the time of its survey, this form's preparation cost \$251 and took about 25 hours and 10 minutes. 1/ Many documents are required for a shipment and the cost and time necessary for each of these quickly mounts. The commercial invoice is required generally throughout the world. It is fundamentally a financial form but it is demanded by consuls and customs for import purposes and to clear entry. According to the study, the median total cost was about \$32.50. It necessitates about 3 hours and 11 minutes of work. 2/ A certificate of analysis is frequently required by governments in order to control imports and to obtain sufficient information for accurate tariff classification. It averaged about 1 hour to prepare, and its total costs were about \$12.57 on the average, excluding the analysis itself. 3/

Several nations require a special customs or consular invoice to be prepared on merchandise shipped to them. Among these countries are: Canada, Australia, New Zealand, Tanzania, Ghana, Nigeria, South Africa, United States, 4/ and several South American countries. These documents are said to be required in order for these nations to fully control and identify goods imported into their country. There have been widespread

2/ Ibid., p. 86

3/ Ibid., p. 84

4/ The U.S. requirement can be waived by customs officials if the data are available from other documents covering the import entry.

complaints concerning this requirement. Among the procedures which may be involved in supplying consular and customs invoices are: Purchasing the document from a consulate, translating it, special commodity listings, stamping and certifications, the delay of the cargo shipment while waiting for the consular invoice to clear, and substantial fines for any errors in preparation, translation or procedure. Preparation of an average consular invoice was calculated to cost about \$42.78 in total and to require 7 hours and 21 minutes. <sup>1/</sup> The full cost of preparation, processing, and distribution plus formalization fees averaged \$86.43. In addition, an average of about 10 days was necessary for the completed, corrected and approved consular invoice to be lodged with the importer.

Some nations demand not only consular invoices but their legalization at a consulate nearest the port of shipment of the cargo. A fee is usually charged for the legalization. Particularly severe in this regard are the South American countries and the Philippines. Some idea of the significance of such fees is found in a recent action by Venezuela. On January 2, 1974, Venezuela eliminated its requirement for consular invoices and replaced the income from them by a 3.5 percent ad valorem tariff for customs services, to be assessed upon importation together with the regular import duties.

The U.S. customs invoice has been the object of strong criticism from traders and foreign governments for many years. The invoice is required for the customs entry of shipments having a value of \$500 or more. It is obtainable from U.S. consular offices and prepared by the

---

<sup>1/</sup> Ibid., p. 88.

exporter or freight forwarder. Critics of the form have contended that it is an overly detailed and highly complex document requiring information beyond that normally required by most countries for customs entry. The NCITD study calculated the average cost of preparing the U.S. customs invoice to be \$11.31. 1/

A certificate of origin usually is required by countries which restrict or control trade with particular nations. Some nations complain that the use of certificates of origin is too widespread and that the resulting inconvenience and expense is a barrier to trade. Another complaint has been that information required to be disclosed in some certificates constitutes an unnecessary invasion of confidential business information. The cost of preparation and processing of this document averaged \$12.29, according to the documentation study. 2/

In the Tariff Commission's survey of trade barriers, 132 complaints were received concerning documentation requirements which the complainants considered excessive and burdensome and 50 complaints were received against the cost and inconvenience of consular formalities associated with documentation requirements of some countries. Forty-two percent of the complaints were against developed nations, 58 percent were against the less developed countries (including virtually all complaints concerned with consular formalities).

---

1/ Ibid., p. 112.

2/ Ibid., p. 85.

U.S. documentation requirements were the object of more complaints than those of any other developed country. About half of the complaints against U.S. requirements concerned use of the special customs invoice (Form 5515) for the entry of imports. <sup>1/</sup> Documentation requirements for U.S. export shipments under programs of the Agency for International Development (A.I.D.) and requirements for products under U.S. export control programs each drew about 20 percent of the complaints. Also mentioned were documentation on label approvals for imported alcoholic beverages, documentation required to meet certain U.S. customs valuation regulations, and certificates of origin requirements on certain shipments (which are no longer applicable).

Among the complaints filed against the major foreign developed countries were the following: Use of a special customs invoice for import entries (Canada, Australia, New Zealand, South Africa); documentation requirements on pharmaceuticals and drugs (Italy, Netherlands, United Kingdom, Japan); requirement of a certificate of authenticity for bourbon whiskey (France, Netherlands, United Kingdom, South Africa, New Zealand, Japan); certificate of origin (Italy); declaration of value (Australia); homologation certificates for boats (Italy); textile samples attached to each of four copies of invoices on textile shipments (South Africa); and in Japan, for certain products, documentation showing the distribution network, the price at each stage until the final purchaser, and the names and commissions of all middlemen.

---

<sup>1/</sup> After the Tariff Commission survey for the present study was completed, new statistical reporting requirements on U.S. imports were issued in 1973, the primary purpose of which was to provide for the collection and reporting of f.o.b. and c.i.f. data on U.S. imports. In response to strong objections by U.S. importers against the requirement as originally published, the requirement was modified before being put into effect.

## Regulations on Samples, Returned Goods, and Reexports

Traders are generally of the view that customs duties should not be collected on commercial samples and advertisements shipped in international trade in connection with the solicitation of sales, on imported products found to be defective or not in conformance with the purchase contract (and consequently returned abroad or destroyed), or on imported goods which are reexported abroad for other reasons. Probably most governments, at least among the major developed countries, have made some provisions to accommodate traders in these matters. Frequently, however, the administrative procedures which have been established for such transactions are cumbersome, expensive, and often drag on for many months. International conventions have been developed under the aegis of the Customs Cooperation Council to expedite and facilitate transactions of this type.

Complaints relating to samples, returned goods, and reexports which were submitted in the Tariff Commission's survey of trade barriers were about evenly divided between developed and developing countries. A large number of the complaints dealt with quantitative limitations imposed in many countries on pharmaceutical samples and advertising matter. Argentina, Brazil, Chile, Mexico, Venezuela, and India drew complaints for assessing duties on samples or imposing complex and long procedures, extending sometimes up to 8 months, to obtain permits for duty-free entry.

The Japanese and U.S. procedures for the entry of samples were also

criticized. Several traders complained of the impossibility or extreme difficulty in obtaining a refund of import duties when imported products are reexported from Denmark, Italy, the United States, and several Latin American countries. Several U.S. manufacturers complained of the cumbersome of the U.S. drawback procedures, and one very large firm reported that it forgoes over \$200,000 in annual drawback payments because it is unwilling to undertake the "onerous" record keeping necessary to claim the payments. 1/

---

1/ Information on U.S. drawback provisions can be found in the following reports by the U.S. Tariff Commission: Study of Temporary Entry Provisions of Title 19 of the United States Code, Report on Legislative Objectives, TC Publication 170, 1966, and Study of Temporary Entry Provisions of Title 19 of the United States Code, Report on Use of Temporary Entry Procedures and Tentative Proposals, TC Publication 286, 1969.

## Customs Classification of Merchandise

If a country wishes to apply different tariff rates to different products, a system to classify goods by tariff category is required. The classification system and its principles of operation are usually referred to as a "tariff nomenclature." Inasmuch as a product's classification will determine the rate of duty to be assessed, traders have long had a keen interest in tariff nomenclatures and their application.

Over the past hundred years, tariff nomenclatures have developed into instruments of formidable complexity. Those of the major trading nations contain at least a few thousand separate product categories, each with individual rates of duty, and the nomenclatures in many of the smaller countries are equally detailed. Such detailed differentiation among products unavoidably gives rise to frequent disputes between customs officials (who must classify imported merchandise in the system) and importers (who naturally seek the lowest possible tariff charge) as to the correct classification of goods. In the United States alone, approximately 50,000 formal protests are filed annually against tariff classifications made by customs officials.

International harmonization of customs nomenclatures

It was long ago recognized that trade is hindered if a shipper cannot easily determine in advance with reasonable certainty the import duties and other charges which will be levied upon his goods,

or if decisions in disputes dealing with tariff classification are time consuming and involve expensive legal and administrative proceedings. To minimize these problems, proposals were made in the 1920's in the League of Nations for the adoption of a common international system for customs nomenclature, and the subject was again considered after World War II at the United Nations Conference on Trade and Labor, but in both cases no appreciable results were achieved.

After World War II, customs unions in several areas of the world were proposed. Since a common nomenclature is virtually essential for the operation of a customs union, pursuant to such proposals in Europe, a standard nomenclature was developed by an international study group meeting in Brussels, Belgium. The nomenclature, which appeared in December, 1950, in the form of an international Convention on the Classification of Goods in Customs Tariffs, is now commonly referred to as the Brussels Tariff Nomenclature (BTN). Within 10 years this nomenclature had been adopted by all major countries of Europe; today it is used by most countries of the world. Canada and the United States are the only major trading nations which have not adopted the BTN.

Pursuant to the Customs Simplification Act of 1954, the U.S. Tariff Commission undertook a complete revision and modernization of the U.S. tariff nomenclature which existed at that time. The results of this work were ultimately enacted into law as the Tariff Schedules of the United States (TSUS), which became effective in August 1963. Major goals in preparation of the new schedules were

simplification and the elimination of uncertainty in tariff classification for U.S. imports. The TSUS is possibly the most carefully and expertly drafted tariff nomenclature in the world. However, it is a unique classification system.

The Canadian tariff nomenclature has not undergone a complete revision and updating since 1908, although parts of the schedule are continuously being changed and modernized from time to time. In 1969 most provisions for chemicals in the Canadian schedule were revised to conform to the BTN for those products.

Because the tariff classification nomenclatures of Canada and the United States differ substantially from the widely used BTN standard system, they have been criticized as constituting barriers to trade. 1/

#### "Arbitrary" classification practices

Probably so long as customs tariffs are used, importers will find customs officials "arbitrary" in their classification decisions when such decisions result in the importer paying a higher duty than he thinks should be demanded under the provisions of a country's tariff. In the Tariff Commission's survey, complaints of arbitrary customs classification practices were made against several countries, including the United States. For the most part, these complaints

---

1/ At the request of the President, the Tariff Commission instituted in August 1972 a study for the purpose of preparing a draft translation of the TSUS into the basic format of the BTN. The study is scheduled for completion in September 1974. U.S. adoption of the BTN would require legislation by the Congress.

reflected either a disagreement between the importer (or foreign exporter) and customs officials as to the interpretation of the tariff nomenclature of the importing country, dissatisfaction with the way a product is defined, or a dislike for some other aspect of the importing country's nomenclature. In all cases, the complainant felt higher duties were collected than were justifiable; in some cases the complaint involved the additional element of uncertainty as to what the ultimate duty collection would be. The most significant practices which were described as arbitrary are summarized in the following paragraphs.

Australia.--For textiles and chemicals, Australia practices what is called a "substitute notice system," whereby customs officials may apply to product A, the customs duty applicable to product B if: (1) product A is a substitute for product B; (2) product A is intended to be or can be used as a substitute for product B; (3) product A can be used for the same use as B; or (4) product A is an imitation of product B. Chemical producers particularly complained that it is the nature of chemicals to be put to different uses and that the uses change frequently. They felt that Australian officials can arbitrarily designate substitution relationships for chemicals for the application of higher rates of duty. The practice was said to create a significant uncertainty for exporters of chemicals and textiles.

Canada.--A number of tariff headings in the Canadian schedule distinguish products "of a class or kind made in Canada" from those which are not. Products in the first category are subject to higher duties. For every article imported under such provisions, customs officials must determine whether or not it is to be considered as of a kind made in Canada. Many arguments have arisen as to whether imported products are "of a class or kind" made in Canada in terms of actually competing with Canadian products. The practice was criticized principally because of the uncertainty which it introduces into the determination of the amount of duty which will ultimately be required on import shipments.

## Antidumping Practices

Dumping is international price discrimination, or the practice of selling in foreign countries at prices below those charged in the home market of the exporter.

Dumping is generally regarded as objectionable if it causes a distortion of natural trade patterns. Article VI of the GATT recognizes "that dumping, by which products of one country are introduced into the commerce of another country at less than the normal value of the products, is to be condemned if it causes or threatens material injury to an established industry . . . or materially retards the establishment of a domestic industry." 1/

To counteract dumping in their markets, most major trading nations have enacted laws which assess special "antidumping duties" 2/ on dumped goods in order to raise the dumping price to the level of

---

1/ Under GATT rules, an article is considered to be entered into a country at less than normal value if the price--

"(a) is less than the comparable price, in the ordinary course of trade, for the like product when destined for consumption in the exporting country, or

(b) in the absence of such domestic price, is less than either

(1) the highest comparable price for the like product for export to any third country in the ordinary course of trade, or

(2) the cost of production of the product in the country of origin plus a reasonable addition for selling cost and profit."

2/ Antidumping duties bear a resemblance to, and are frequently confused with countervailing duties. Antidumping duties are designed to offset less than fair prices of imported products attributable to price discrimination by foreign exporters, whereas countervailing duties are instituted to offset such prices of imported products resulting from foreign governmental subsidization. Countervailing duties are discussed in the next section of this report.

home market prices. The GATT provisions prohibit an antidumping duty in excess of the margin of dumping. Also, the levy of antidumping duties is permitted only if the importation of dumped products causes or threatens material injury to the national industry.

In the ordinary course of trade, the situation continually arises where an exporter may sell abroad at a lower price than currently prevails in his home market, and particularly for certain customers. 1/ It is not surprising, therefore, that traders frequently find themselves running afoul of antidumping laws and regulations around the world, and this quite naturally has generated a large volume of complaints, especially during the past two decades.

Charges that countries were using antidumping procedures not as a corrective measure for an unfair trade practice, but rather as a device to provide additional protection for domestic industries against imported products became so widespread in the late 1950's that the GATT contracting parties undertook a broad study of the subject, and a second examination was made in the early 1960's.

During this period, strong complaints were especially leveled against U.S. administrative practices, particularly the length of time taken for investigations and the frequent and prolonged withholding of appraisement. When preparations got underway for the Kennedy Round of trade negotiations under the GATT, some countries

---

1/ Although an exporter certainly is aware of differences in his own selling prices to various customers, he frequently may not know that he is selling a product abroad at prices below "current domestic value," as that value is defined in the antidumping statutes of the country to which he is shipping.

conditioned their participation in those negotiations upon a modification of U.S. administrative practices. Antidumping actions against U.S. exports at that time were being encountered chiefly in Canada, and complaints were heard from U.S. exporters against the abrupt and arbitrary nature of the Canadian procedures.

#### The International Antidumping Code

The eventual outcome of the GATT work was the negotiation of an International Antidumping Code during the Kennedy Round. The Code was intended to supplement and interpret the basic provisions on dumping contained in Article VI of the GATT. Most of the major trading nations, including the United States, have signed the Code. Notable exceptions are Australia, New Zealand and South Africa.

The major objective of the Code was to insure that antidumping practices should not constitute an unjustifiable impediment to international trade. This was to be accomplished largely by a code of conduct for administrative practices which was designed (1) to avoid possible harassment in antidumping proceedings, (2) to reduce the penal nature of the remedies, and (3) to ensure procedural fairness. The Code encourages short periods of investigation; and notification of foreign suppliers of the initiation of such proceedings is required. An opportunity to appear at a hearing must be given to the supplier and he must be notified of the final decision, with the reasons and criteria used. The Code established a Committee on Antidumping Practices to examine antidumping actions of countries and to reconcile any differences that may arise in interpretations of various parts of the Code.

U.S. adherence to the Code was controversial domestically. The President, in accepting the Code, took the position that it was compatible with existing U.S. law. Others contended that the Code's provisions were inconsistent with the U.S. Antidumping Act of 1921. Congress enacted legislation on the matter in October 1968. <sup>1/</sup>

#### The frequency of antidumping procedures

The frequency of formal antidumping actions varies widely among countries. For example, 10 countries which are parties to the International Antidumping Code reported no formal antidumping activity on the part of their governments during the 12 months ending June 30, 1972. The antidumping activities of the other parties to the Code are summarized in table 11-D. It should be noted in connection with data presented in the table that when antidumping duties are imported by any country they normally are actually applied only to a few imports.

Table 11-D.--Summary of antidumping activities

Item	Canada	European Community	Finland	Greece	United Kingdom	United States
1. Cases pending as of 1 July 1971-----	10	1	-	9	2	34
2. Investigations opened-----	9	11	1	-	9	39
3. Cases on which provisional action taken-----	8	-	-	-	2	29
4. Cases on which final decision reached:						
a) antidumping duties imposed-----	5	-	-	-	3	16
b) cases settled through price undertakings-----	-	3	-	-	1	6
c) cases dismissed-----	6	1	-	1	5	9
5. Revocation of antidumping duties-----	-	-	-	-	1	-
6. Cases pending as of 30 June 1972-----	10	8	1	8	3	44

Source: General Agreement on Tariffs and Trade, Basic Instruments and Selected Documents, 19th Supplement.

<sup>1/</sup> See Title II of the Renegotiation Amendments Act of 1968 (P.L. 90-634), and also Report of the U.S. Tariff Commission on S. Con. Res. 38, Regarding the International Antidumping Code Signed at Geneva on June 30, 1967, Committee on Finance, United States Senate, 1968.

In the United States, for example, only imports on which appraisement has been withheld pending completion of the investigation usually pay antidumping duties because the importer immediately adjusts his prices upward if a finding of dumping is made. In 1972, the United States collected \$229,429 in antidumping duties.

Similar data on Australia and South Africa, two important countries which are not parties to the Code, are not available. The frequency of complaints against these countries, however, would seem to indicate that they are among the more active users of antidumping proceedings.

Various explanations have been suggested for the fact that some countries use antidumping procedures far less frequently than others. Undoubtedly, this is in part due to a difference in the commercial policy views of the countries on the matter of dumping. Another explanation put forward is that countries with few formal antidumping actions apply other measures to imports which their customs officials consider to be below normal value and thereby obviate the need for a formal antidumping proceeding. In some countries, for example, this can be accomplished when ad valorem duties are used simply by an upward adjustment in the customs value of the merchandise sufficient to offset any under valuation that might constitute dumping.

#### Complaints against foreign antidumping practices

Some of the complaints submitted to the Tariff Commission against foreign antidumping practices were similar to complaints made against U.S. practices. The complainants seem to share the consternation of

traders throughout the world when they unexpectedly find themselves confronted with a charge of dumping their product because of pricing in a manner which they consider legitimate business practice but which government officials in another country interpret otherwise.

The major complaints against foreign countries involved Australia, South Africa, and Canada.

Australia.--Australian customs officials impose provisional dumping duties after a complaint has been filed by an Australian industry as soon as they are satisfied that a prima facie case of dumping exists. The provisional duties are collected until the Tariff Board makes a finding in the case, and there is no limit on the time the Board may take for this. Two large U.S. chemical producers and a manufacturer of saws reported that this procedure has effectively destroyed markets which they had spent substantial sums developing and servicing. These same producers expressed dissatisfaction with the manner in which normal values for the determination of dumping are ascertained under Australian laws and regulations. Other complaints were made against the criteria which the Tariff Board appears to follow in their determinations of injury in antidumping cases. All of the complaints concerning Australia expressed the view that the Australian procedures did not allow sufficient opportunity for proper presentation by the foreign exporter of a refutation of the dumping charge.

South Africa.--In South Africa, goods are considered dumped if the price is below the "current domestic value" in their home market. U.S. producers of chemicals and wood products complained of the manner in which South Africa determines "current domestic value." It was reported that published price lists are arbitrarily used for this purpose without taking into consideration the discounts normally given on such list prices. One respondent felt the South African procedure favored companies which do not issue price lists. Some respondents felt antidumping duties had been imposed unjustifiably, contending that neither the volume of imports nor the price at which they had been entered could have adversely affected South African producers. Under South African law, customs officials may impose dumping duties whenever it is determined that "detriment may result to an industry" from the dumped imports.

Canada.--The Canadian antidumping system was completely revised after Canada adhered to the International Antidumping Code. This revision, which instituted an administrative mechanism based on the U.S. antidumping system, removed the basis for many of the major complaints which previously had been made against Canadian practices, and particularly the "automatic" application of dumping duties, which U.S. exporters had found so objectionable. In the present investigation complaints received against the new Canadian system concerned the manner in which normal value is determined, and particularly for transactions between related firms. One respondent stated: "We are given pricing formulas which we must use in computing fair market values

for products sold to our subsidiary in Canada. Using this arbitrary pricing formula, the cost of the goods to our own subsidiary is often higher than our prices to independent dealers in the United States."

#### Complaints against U.S. antidumping practices

After the Antidumping Code was negotiated, the U.S. Treasury Department substantially modified its administrative procedures in the antidumping area. The changes were principally designed to remove the cause of the numerous complaints which had been made during the 1950's and early 1960's against the prolonged U.S. procedures and withholding of appraisement. In spite of these modifications U.S. antidumping practices continue to be severely criticized.

In the Tariff Commission's current investigation of trade barriers, the American Importers Association (AIA) presented a lengthy detailed criticism of U.S. antidumping practices and several other complaints were received from individual importers.

Foreign governments also have strongly criticized U.S. antidumping practices in the past few years. Such criticism has appeared principally in meetings of the GATT Antidumping Committee, where representatives of the European Community, the United Kingdom, Sweden and Japan have taken the position that certain practices of the U.S. Treasury Department and findings of the Tariff Commission violate the Antidumping Code. 1/

---

1/ For a discussion of some of the current complaints made against U.S. practices see John J. Barcelo, "Antidumping Laws as Barriers to Trade -- The United States and the International Antidumping Code," in Cornell Law Review, April 1972.

### Countervailing Duties

Countervailing duties are special duties imposed on imported products in addition to regular duties, if, under designated circumstances, these products benefit from foreign subsidies.

Countervailing duties differ significantly from regular duties and also from other trade barriers; regular duties and other trade barriers restrict international competition and the efficient allocation of world resources, whereas countervailing duties are designed to protect international competition and efficient resource allocation by counterbalancing the restrictive effect of another nontariff barrier, subsidies. It follows, therefore, that countervailing duties should be considered trade barriers only if improperly applied. Countervailing duties are supposed to counteract the effects of foreign subsidization only, and not to serve as a protective device against other means of import competition.

#### GATT provisions on countervailing duties

Article VI(3) of the GATT defines a countervailing duty as "a special duty levied for the purpose of offsetting any bounty or subsidy bestowed, directly or indirectly, upon the manufacture, production or export of any merchandise." To make sure that countervailing duties should not be used as a protective device, per se, but only as a device to offset the effect of subsidization, the GATT limits the amount of the countervailing duty to the amount of subsidy granted. Moreover, under the GATT, countervailing duties are not to

be levied unless the subsidization to be countervailed threatens "material injury to an established domestic industry, or is such as to retard materially the establishment of a domestic industry." It should be pointed out that the GATT rules do not oblige countries to impose countervailing duties if the party injured in their market by foreign subsidies is not a domestic industry, but rather exporters of a third country.

The GATT does not offer any comprehensive definition of governmental measures that are to be regarded as subsidies. However, the GATT explicitly states that the exemption from indirect taxes applied to domestic consumption of the exported article does not constitute a subsidy.

#### U.S. provisions on countervailing duties

The U.S. countervailing duty statute was first enacted in substantially its present form in 1897. The present version 1/ provides that whenever any country bestows a bounty or grant upon a product, "then upon the importation of any such article ... into the United States, ... there shall be levied and paid, in all such cases, in addition to the duties otherwise imposed ... an additional duty equal to the net amount of such bounty or grant ..." The countervailing duty statute provides that the subsidies on which countervailing duties are imposed may be granted upon production as well as exports, and may be direct or indirect. Countervailing duties can only be imposed on imported items that are otherwise dutiable; they cannot be imposed on duty-free articles.

---

1/ Tariff Act of 1930, sec. 303, 19 U.S.C. 1303 (1965).

The statute contains no provision concerning injury of a competing domestic industry, therefore it does not conform with Article VI 6(a) of the GATT, which provides that the determination of such injury is a prerequisite for the imposition of countervailing duties. Since the U.S. statute predated the GATT, its continued application without violating the agreement is permitted under the Protocol of Provisional Application of the GATT. Foreign countries have frequently criticized the U.S. exemption and called for an international countervailing duty code, the implementation of which would require the amendment of the relevant U.S. statute.

The wording of the U.S. countervailing duty statute permits a broad interpretation and application thereof, the more so since the terms "bounty" and "grant" (currently generally referred to as subsidies) are not defined in the statute or administrative regulations issued under it. Hence, great discretion has been delegated to the Secretary of the Treasury, who was designated under the statute to determine on his own initiative, or following a complaint, whether a subsidy is involved, and to assess and collect countervailing duties accordingly. <sup>1/</sup>

The U.S. Customs Service or the Secretary of the Treasury are not required to disclose the reasons of their determination. It is notable in this respect that the existence of comparable U.S. subsidies does not preclude countervailing action against foreign

---

<sup>1/</sup> The Secretary of the Treasury, in turn, redelegated this discretion to the U.S. Customs Service, which actually investigates subsidy complaints and makes the assessment of countervailing duties.

subsidies. The law does not place a limit on the time by which a decision must be reached after a complaint is filed, and U.S. countervailing duty proceedings generally have taken a considerable period of time.

Until now only importers have had the right to challenge the Treasury's imposition of countervailing duties in court. However, quite recently it has been proposed in Congress that U.S. manufacturers should also have the right to judicial appeal against a finding of the Treasury that denies their petition for countervailing duties.

#### Countervailing practices

It appears that countries other than the United States seldom, if ever, resort to countervailing, although several countries have countervailing measures in their statutes. <sup>1/</sup> The application of other protective devices, however, frequently preempts the need for countervailing. There is no information readily available that thus far U.S. interests would have been affected by the imposition of countervailing duties.

The United States has applied countervailing duties only infrequently. Since the first statute was enacted in 1897, countervailing duty orders have been issued in about 70 cases.

---

<sup>1/</sup> New Zealand is known to have imposed countervailing duties in certain instances.

The term "countervailing duty" is frequently misused to describe a charge levied on imports in order to bring the price of an imported article up to a minimum specified by the government before the imported article is permitted entry. Such charges, however, are not imposed to counterbalance a foreign subsidy.

Earlier examples of U.S. countervailing duty impositions frequently involved foreign subsidization in the form of currency retention schemes and other related practices. Prior to the second World War the United States imposed countervailing duties in connection with German subsidization involving such manipulations. The National Socialist Government of Germany blocked foreign accounts, not permitting foreign firms to transfer their receipts out of Germany. American firms generally transferred their accounts, often at substantial discounts, to firms that used them to purchase goods that were approved and encouraged for export. This blatant form of currency manipulation subsidized German exports with funds received from U.S. and other imports.

Another instance of U.S. countervailing duty imposition against currency manipulation of a foreign country occurred with respect to exports of combed wool tops from Uruguay to the United States in 1953. In order to encourage the export of certain products (mostly of those with a high domestic value-added content), the Government of Uruguay permitted exporters of such products to convert their proceeds into pesos at higher rates of exchange than those granted to exporters of other products. Such privileged rates, in turn, enabled the exporters so favored to lower their export prices and compete more successfully in foreign markets. Although the Court of Customs and Patent Appeals ultimately overruled the application of countervailing duties in this case, stating that the calculation of the amount of subsidy involved was not supported by substantial evidence,

the Court nevertheless recognized that, in theory, the use of multiple exchange rates could result in subsidization.

In the late fifties and most of the sixties little use was made of the U.S. countervailing duty statute, but several countervailing duty orders have been issued since 1967. This recent surge in countervailing action reflected increased import competition on the U.S. market, resulting partly from intensified foreign subsidization of exports destined for the United States. In recent years, the most outstanding example of U.S. countervailing involved foreign subsidization in the form of direct payments to exporters. The U.S. Government imposed countervailing duties on most dutiable French imports, effective September 1968. In July of the same year the French Government granted direct subsidies to exporters which were designed to offset higher wage costs resulting from the civil disturbances that took place the previous May. The U.S. Government estimated the amount of the French subsidy on the average at 2.5 percent of the f.o.b. price, and imposed the same rate of countervailing duties. This duty rate was later cut to half upon an equivalent reduction by the French Government of the subsidy. Early in 1969, the French Government discontinued the payments altogether and the U.S. Government subsequently removed the countervailing duties on imported French merchandise.

Several countervailing duty impositions by the U.S. Government in recent years relate to the subsidization of exports from Italy to the United States, based on the Italian Law 639, of July 1964.

This law stipulates that certain industrial products (there is a list of 473 items) shall qualify on export for a refund of customs duties and various domestic indirect taxes, in addition to the Italian turnover taxes. Beginning in 1967, the Treasury Department has imposed countervailing duties on imports of transmission towers, welded wire mesh, ski lift towers and, most recently in March 1972, on compressors used in refrigerators, freezers and other appliances, imported from Italy, and benefiting from Law 639. When Italy shifted to a value-added tax system on January 1, 1973, some of the direct taxes which in part formed the basis of the rebates countervailed in the United States were discontinued. Nonetheless, it appears that this tax reform did not completely eliminate a further potential subsidization of Italian exports under Law 639.

Another example of most recent U.S. countervailing practices involves a case of subsidization of regional development in Canada in the form of grants, low interest loans and tax concessions. Effective February 1973, the Treasury Department imposed countervailing duties (estimated at 6.6 percent of the f.o.b. factory price) upon imports of X-radial steel-belted tires produced by Michelin Tire Ltd., of Nova Scotia, Canada. The Treasury's action was based upon the finding that the Canadian Government and the provincial government of Nova Scotia made grants amounting to \$23 million, the provincial government of Nova Scotia extended a low-interest loan of \$50 million, and local municipalities provided property tax concessions to the two plants of the Michelin Company in Canada. This was

the first time that the United States has invoked the countervailing duty statute when subsidization of regional development was involved. The Treasury Department indicated it was imposing countervailing duties in this case because output of the plants being subsidized would be chiefly exported, and predominantly to the U.S. market.

Opponents of countervailing Michelin's imports have taken the position that although the subsidies in question benefit production intended partly for export, this effect is incidental, i.e., the subsidies are "nondiscriminatory" in character. Moreover, they point out that regional development subsidization is standard practice in several countries, and a substantial number of U.S. exporters have also benefited from programs of this nature.

Although the subsidization of agricultural exports by foreign governments (especially those in the European Community) has been a significant trade issue in recent years, U.S. countervailing of farm imports has not been significant. 1/

#### An international agreement on countervailing

It has been proposed on several occasions, and particularly by critics of U.S. countervailing duty practices, that an international code on countervailing duty practices should be developed along the lines of the antidumping code. In the late 1960's, GATT members agreed in principle to hold discussions in this area, but

---

1/ The U.S. Government imposed countervailing duties on agricultural imports such as tomatoes and tomato concentrates from Italy, the sugar content of certain articles from Australia, and barley and molasses from France.

the United States and the European Community were unable to agree on the terms of reference of a working party to be established. The position of the United States was that countervailing should be discussed in the broader context of subsidy practices, especially those applied in agriculture; the European Community, on the other hand, did not want to discuss agricultural subsidization, but desired to focus instead on the removal of the exemption the United States enjoys from the injury requirement in its countervailing practices.

The elimination of the countervailing practice from international trade is intimately related to the removal of subsidies as international trade barriers. The solution of the latter, which is the primary problem, would automatically wipe out the practice of countervailing as well.

## Chapter XII

## DISCRIMINATORY OCEAN FREIGHT RATES

## Introduction

Many U.S. producers and exporters reported to the Tariff Commission that discriminatory treatment in ocean freight rates greatly weakens their ability to compete abroad and enhances the competitive strength of foreign industries in the U.S. market. For example, ocean freight rates on many commodities from the United States to Japan are higher than the rates from Japan to the United States on the same products. The differences frequently are large, ranging from 20 percent to well over 100 percent. Moreover, since most foreign tariffs are applied on a c.i.f. basis, and most foreign consumption taxes, such as the value-added taxes in Europe and the commodity taxes in Japan, are applied on a landed duty-paid basis, the effects of the discriminatory rate treatment are multiplied.

For economic and security reasons, ocean shipping has long been regarded by nations of the world as a vital question. The United States has been no exception, expressing its concern about shipping and ocean freight rates with legislation which in this century alone runs from the Shipping Act of 1916 to the Merchant Marine Act of 1970. One of the major developments resulting from this legislation was the formation of the Federal Maritime Commission (FMC) in 1961 as the successor to the Federal Maritime Board. The FMC was charged, among its other duties, with guarding the U.S. foreign commerce against unjustly discriminatory

shipping practices. Two years later, the Joint Economic Committee of the U.S. Congress began an investigation of ocean freight rates which it maintained were a possible source of one such discriminatory practice. On the basis of a series of hearings from 1963 to 1965, the Joint Economic Committee issued this finding:

The international ocean freight rate structure is weighted against U.S. exports. Our exports bear most of the cost of vessel operation, even in trades where imports approximate exports in value and quantity. Government studies reveal that on trade between the U.S. Pacific coast and the Far East, freight rates on American exports exceeded rates on corresponding imports on 80 percent of the sampled items. This same discrimination prevails on 70 percent of the products shipped by American exporters from U.S. Atlantic and gulf ports to the Far East and on 60 percent of the commodities shipped from the Atlantic coast to Western Europe. 1/

In these differences between inbound and outbound ocean freight rates in U.S. foreign trade, the Joint Economic Committee felt there existed a damaging barrier to U.S. foreign commerce.

The occurrence of a difference in the ocean freight rate charged on the same item moving along reciprocal trade routes is known as a shipping rate disparity. Specifically, for U.S. trade, this means that it is generally appreciably more expensive per ton to ship a commodity from a U.S. port to a foreign port than to ship the identical product, or what is substantially an identical product, from the same foreign port to the same port in the United States--even if the same vessel is used in both cases. The Joint Economic Committee report determined that these

---

1/ U.S. Congress, Joint Economic Committee, Discriminatory Ocean Freight Rates and the Balance of Payments, (89th Congress, 1st Sess.), January 6, 1965, p. 3.

disparities are prevalent in the shipping trade from the United States along all outbound routes. This disparity problem seems to be a matter characteristic of U.S. shipping trade.

Ocean freight rate disparities have been singled out as contributing to the U.S. balance of payments deficit and export malaise by the Joint Economic Committee as well as by various private groups. Some have termed disparities between inbound and outbound rates in U.S. seaborne trade a significant and damaging barrier against U.S. export trade. While acknowledging the disparities, shipping lines, American and foreign, defend the prevailing rate structures as economically just and necessary.

#### Shipping conferences

Shipping disparities are an outgrowth of the organization of ocean liners into conferences. A liner is a ship which operates along definite routes on the basis of definite fixed schedules. Liners are common carriers. They offer their services to the general public and, in the United States, are required by law to publish their freight rates and register them with the Federal Maritime Commission. For charter vessels, no fixed rate schedules are involved. The disparity question does not apply to charter ships since the rates for these ships involve a special agreement between the shipper and the shipping company. <sup>1/</sup> Tramp ships carry on their operations without a regular schedule. Usually, liners

---

<sup>1/</sup> For example, in the recent U.S.-U.S.S.R. wheat sale, charter ships were used to transport the grain. According to the U.S.-U.S.S.R. Maritime Agreement of December 1972, one-third of the vessels had to be U.S. ships, another third were required to be Soviet ships, and the remaining third could be hired from any nationality.

haul only general cargo as opposed to bulk or liquid cargo. Trampers often carry bulk cargo. Tankers, because of their size, make up another category of ships. General cargo liners made up about 58 percent of the U.S. fleet (excluding the Great Lakes fleet) at mid-1971, while of the combined inbound and outbound trade of the United States in 1970, about 17 percent was carried in liners (excluding defense cargoes).

Only liners are organized into conferences, and most liners usually hold membership in one or several conferences. A conference is an association of shipping companies, operating along a specific trade route on the basis of a fixed schedule with a written basic agreement requiring that all member companies charge identical freight rates. Conferences often also undertake to allocate routes, berthing, sailing rights, etc. A conference is involved with freight movement in only one direction. Liners operating in one direction may or may not return by the same route; the goods, facilities, and methods involved in trade in one direction may vary greatly in the other. Thus, a liner frequently belongs to several conferences. Each conference has its own highly complex and intricate rate structure involving literally thousands of commodity classifications. As a result, although many conferences have members in common, each is likely to employ a different system of rates.

The conference system was developed as a reaction against cut-throat competition prevalent among shipping lines in the 19th century, much akin to the development of the railroad rate bureaus of the same period. Consequently, it happened that in the late 1800's, groups of shipowners interested in ocean traffic along specific routes, began to

band together to prevent disastrous rate wars. The development of steamshipping allowed for regularly scheduled sailings. By working in cooperation, these shipping lines were able to offer to the public dependable scheduled service at a uniform charge.

The flag ships of any nation interested in trading along a certain route may join the association. Since they offer identical prices, the conference lines form, in essence, a type of international cartel. However, for the shipper, a dependable program of departures and stability of rates is sufficiently crucial that he will tolerate the conference's monopoly control of rates.

First, by far the majority of knowledgeable shippers desire conditions of stability insofar as ocean freight rates are concerned. They want rates to remain stable for considerable periods of time. They want to know today what the rate will be 30, 60, or 90 days in the future. . . . Another factor involved in stability is reasonable assurance to the shipper that his competitors are paying the same rate he is paying. . . . What the shipper does not want is a situation of frequently fluctuating rates. 1/

Thus, the conference system has benefits for both the shipper and the shipowner.

Although this system fosters stability, it also has significant drawbacks, such as the shipping rate disparity situation in U.S. trade. The problem's proportions become more apparent when it is noted that U.S. outbound rates are substantially greater than inbound rates, in many cases 40 to 100 percent greater. The Joint Economic Committee, in its hearings on ocean freight rates, discovered that shipping rates

---

1/ Federal Maritime Commission, The Effect of Steamship Conference Organization, Procedure, Rules, Regulations and Practices upon the Foreign Commerce of the United States, Fact Finding Investigation No. 6, Aug. 16, 1967, p. 187.

on goods moving from the United States to "third market" ports are also far greater than those rates which are charged on the same commodities from other industrialized countries traveling to third market ports, even though the United States is far closer to these ports in nautical miles. 1/ It is not difficult to understand why a U.S. exporter becomes disturbed at the thought of paying a larger freight charge to ship his product to a market than his foreign competitor who is more distant from that market.

#### Government review of shipping conferences

Governments are hard pressed to bring review authority to bear on the actions of shipping conferences. Although the conferences are a kind of international monopoly, U.S. firms holding conference membership are exempt from antitrust action and have been since the early 1900's. It has long been the policy of the U.S. Government to allow the conferences to set ocean freight rates in foreign commerce. This kind of policy has been quite common; it is not unusual to observe a lack of governmental control of conferences and shipping rates in a great many maritime nations. 2/

---

1/ This chapter deals chiefly with maritime practices of developed countries. In order to give more complete coverage of the disparity picture, it should be noted that Gilbert Verbit in his Trade Agreements for Developing Countries (New York, 1969) states that the developing countries of the world face a disparity problem in shipping rates, not from the developing to the developed countries, but between the less developed countries themselves. Conferences would surely argue that the rates are high because of the lower volume of traffic.

2/ For example, among the major trading nations, Belgium, Canada, Denmark, Finland, West Germany, Greece, Ireland, Italy, the Netherlands, Norway, Portugal, Spain, Sweden, Turkey, and the United Kingdom also do not regulate activities of liner conferences or the setting of ocean freight rates in its foreign seaborne commerce. France regulates rates between metropolitan France and Algeria but not elsewhere. The Japanese Government does not officially regulate rates in international shipping, but steamship conferences are required to report rates in advance to Japan's ministry of transportation.

The U.S. Government does reserve the right to disapprove of particular conference rates as discriminatory to the nation through the regulatory powers of the Federal Maritime Commission. 1/ The FMC has probably been the most active of any national governmental agency in its efforts to influence the conferences. When the U.S. Congress passed legislation instituting the FMC, it bestowed upon this organization many broad-ranging powers, and the scope of FMC authority and actions have given pause to some foreign nations.

The question is how far FMC action goes toward the unilateral government control of trade. The Commission has asked shipping lines engaged in trade to and from America for details of the total revenue tons of cargo they carry, the total gross freight revenues they earn, the number of revenue tons of certain commodities, and the gross freight earned on the carriage of these commodities. It has also drafted a contract form for use in agreements between both foreign and American exporters, and then ordered conferences based both inside and outside America to adopt this. 2/

However, it is very difficult for the U.S. Government to monitor the conferences, for the conferences are not national bodies. Foreign nations may validly object when the United States attempts to review a conference, which is an international body. Moves to control foreign-owned steamship companies and foreign-based conferences may be seen by other maritime nations as violations of international law. Reactions to U.S. efforts toward securing information from foreign flag lines in order

---

1/ Section 17 of the U.S. Shipping Act, 1916, provides that, after notice and hearing, the Commission may disapprove a rate found to unjustly discriminate against an American exporter, as compared to his foreign competitors or disapprove certain unjust discriminations between shippers and ports. Section 18(b)(5) of the same act provides that the Commission, after hearing, may disapprove a rate or charge which it finds to be so unreasonably high or low as to be harmful to U.S. commerce.

2/ "Conflict at Sea," The Economist, Sept. 5, 1964, p. 936.

to make rate judgments have created difficult international situations; in 1964, for example, the British Government adopted legislation forbidding its shipping lines from obeying certain U.S. laws. The Consultative Shipping Group (CSG), a forum of 12 European nations and Japan, had its origins in the discussions among these nations in the early 1960's concerning how they might counter the actions of the FMC which they regarded as an intrusion of foreign authority over their national trade. 1/

The different interpretations of the role of government review over the conferences is illustrated in the recent attempts to write and implement a code of conduct for liner conferences. In 1971, the CSG governments requested The Committee of European National Shipowners Association (CENSA) to elaborate on a code of practice for liner conferences. As described in the resulting CENSA code, government representatives are not made participants in the procedures for conference consultation or conciliation. However, a developing country code, written as a draft code as a basis for discussion for the third UNCTAD conference held in April and May 1972 2/ provides that:

Disputes which cannot be settled as a result of consultation may be referred to local arbitration or, if so required by national legislation or regulation of the country from which the cargo originates, submitted to the decision of the government of that country...but disputes in the following case will, unless national legislation or regulation of that country provides otherwise, be referred to international arbitration.... 3/

2/ See UNCTAD document TD/III/c.4/L.2 and Annex and Corr. 1.

3/ Article 68 of the draft resolution submitted by Indonesia, Chairman of the Group of 77, on behalf of the Group. For a fuller discussion of this subject, see "UNCTAD III - The Question of Shipping," by Stephen Zamora in The Journal of World Trade Law, January-February 1973.

In other words, there is little or no agreement as to the proper relationship between government and conferences, and the international character of the conferences help these associations to remain free of any overt national control.

It has also been inferred that national blocs of shipping lines within the conferences try to exert some influence on the rate setting procedures in order to gain an advantage for the nation of their flag. In many conferences, one nationality group often does form a majority of the members. As participants in the conference, all member lines, regardless of the flag they fly, charge rates according to the same system. Each full conference member possesses one vote in the decision of a rate system. 1/ The conference rate setting methods are based upon several essential criteria common to most conferences of the world. With the exception of Japan, it is almost universally true that the conference shipping lines have little tie to their national manufacturing sector. It seems that though a nationality group may represent a majority of conference votes, there is little basis for the favoring of a particular nationality. For example, although the U.S. conference lines are aware that the United States faces a disparity problem, a shipping company is not likely to surrender the profits that high freight rates afford it in order to aid in the solution of the national problem.

#### The conference rate making system

As stated, the conferences examine each potential shipper's product according to several criteria before they set a rate. They study

---

1/ There are associate conference members, which have no vote.

the value of the product which the shipper wishes to export. The probable volume of the commodity's movement overseas is examined. The conference looks at the competitive situation of both its customer and itself with regard to this product. Also observed are the cost of shipping operations, loading, stowing, and unloading of the product and the transportation characteristics of this commodity (perishable, dangerous, flammable, fragile, etc.). However, each conference may apply and interpret these criteria in a way unique to itself. Considering the incredibly complex commodity classification system and different application of these basic precepts for rate making by each conference, it is not surprising that each conference has a very personalized rate structure.

Within the framework of these conference criteria, some basis for the disparity situation exists. The conference uses the commodity's value as a major measure for the levying of a freight rate. U.S. unit prices tend to be higher than those of its trading partners, and as the value of a product increases, the rate charged on it likewise increases. Under these circumstances, it is not unreasonable to expect that freight rates levied on many products originating in the United States would reflect these greater values.

Another conference criterion is the cost of ship operation. Some explanation for the disparities in the trade with third market ports exists because, according to the shipping lines, the greatest part of the cost of ship operation is not in moving the goods across

the ocean but in loading, stowing, and unloading. 1/ Another consideration, though secondary, on the subject of ship operation is the possibility that the very presence of U.S. liners in a conference may force up the freight rates. The cost of U.S. merchant marine is high relative to other maritime nations. U.S. liners probably are most competitive in the uniform and closely regulated atmosphere of the conference. When liners take part in conferences and agree to use the same rate schedule, they expect that this suppression of competition will enable them to show a profit.

The competitive norm appears to require the regulatory body to determine the lowest rate level at which all the carriers that are needed to provide the service (demanded at that rate level) would earn at least enough revenue to cover all their costs. The highest-cost carrier in this group--i.e., the marginal carrier--would earn little or no more than that amount. Such a method would prevent shippers from being penalized because of the abnormal revenue requirements in an over-tonnage trade. 2/

Thus, it is possible that the presence of liners with higher expenses may well create a need for a higher rate structure in order to allow all conference members to operate at a profit. This results in a general upward trend in rates both outbound and inbound. 3/

For the conferences, the assumption that the inbound and outbound rates on a specific product should be equal is fundamentally wrong.

---

1/ An FMC investigation has established that the United States is the highest cost country in respect to loading and discharging.

2/ William L. Grossman, Ocean Freight Rates (Cambridge, Md.; Cornell Maritime Press, 1956), p. 125.

3/ FMC Fact Finding Investigation No. 6 (August 16, 1967) states that it appears likely that the higher American flag operating costs, especially in trades where unsubsidized American flag carriers predominate and where there is a large movement of government cargo, would cause a tendency toward higher freight rates.

This opinion is due in some part to their theory of the "product mix" of a trade route. Even though a certain product, manufactured in the United States and abroad, is identical, exactly the same in dollar value, and the U.S. originating and foreign originating commodity must travel the same nautical miles to reach the final market, the rates will probably not be the same. Each identical product may not travel in exactly the same quantity at the same time with the same accompanying goods. Thus, since the "product mix" is different, the conference feels that there is a justifiable basis for different rates.

Beyond these considerations, the conference, in setting its rates, tries to make itself aware of both the shipper's ability to pay a certain rate and also by what amount this rate can rise until the shipper's product is priced out of the foreign market. Simply stated, the conference tends to charge what it thinks the traffic will bear. By exacting a rate that could possibly dry up the market for a U.S. export, the conferences would only be denying themselves future business.

#### Cargo preference

Many nations employ a system of cargo preference as a means of subsidizing their national fleet. In order to provide for the carriage of a substantial part of U.S. foreign trade in U.S. flagships, legislation was enacted awarding special types of government-owned or financed cargoes to U.S. flag commercial ships. One such act which was passed in 1904 gave U.S. flagships preference in the transportation of supplies for the armed forces overseas. Public Law 664 (1954), known

popularly as "The Cargo Preference Bill," likewise provided preferential treatment for the U.S. merchant marine.

Whenever the United States shall procure, contract for, or otherwise obtain for its account, or shall furnish to or for the account of any foreign nation without provision for reimbursement, any equipment, materials, or commodities, within or without the United States, or shall advance funds or credits or guarantee the convertibility of foreign currencies in connection with the furnishing of such equipment, materials, or commodities, the appropriate agency. . . shall take such steps. . . to assure that at least 50 per centum of the gross tonnage of such equipment, materials, or commodities. . . which may be transported on ocean vessels shall be transported on privately owned United States flag commercial vessels, to the extent such vessels are available at fair and reasonable rates for United States flag commercial vessels in such manner as will insure a fair and reasonable participation of United States flag commercial vessels in such cargoes by geographic areas. . . 1/

In addition, Public Resolution No. 17, passed in 1934, provided that exports financed by loans from the Reconstruction Finance Corporation or any other such Federal Government agency be carried only in U.S. flagships. It is possible to set aside these requirements, and they have been set aside often.

What is the effect of cargo preference? There have been many complaints that the practice is highly detrimental to world trade.

This system of artificial quotas or of building walls around these cargo markets not only removes them from the free play of competition but is contributing to a world shipping system of restricted markets. . . . The temptation is for each nation to follow the shortsighted practice of restricting the carriage of its import and export trade to vessels

---

1/ As quoted in Wytze Gorter, United States Merchant Marine Policies: Some International Economic Implications, Essays in International Finance, No. 23, (Princeton University Press, 1955), pp. 9-10.

flying its flag. . . .At best, the result will very likely be a world shipping system in which large portions of the world's fleet go empty half the time. 1/

U.S. unions and shipping lines feel differently. Their opinion is that cargo preference is a major force in keeping the American merchant marine in operation. Certainly the implementation of the concept of cargo preference is increasingly common. "Brazil, Chile, Colombia, France, Peru, the Philippines, Taiwan, Uruguay, and Venezuela have all adopted cargo preference measures since the United States enacted in 1954 Public Law 664. . . ." 2/

The conference usually, as a matter of practice, regards the transportation arrangements and rate structure for government cargo as a matter of negotiation between a national government and the shipping lines of that flag. Unfortunately, this kind of method can add to a shipping rate disparity problem, as is the case with the United States. The cargo preference system creates a tendency towards upward pressure on freight rates. There is certainly less competition for government-owned cargo which is reserved to national flag ships. Where competition is less, rates have a tendency to increase. 3/ This problem is compounded when, in the same trade, a commodity moves both commercially and as preference cargo.

---

1/ Covington and Burling, Counsel for A.P. Moller, Copenhagen, "Statement on Cargo Preference," U.S. Congress, Joint Economic Committee, Discriminatory Ocean Freight Rates, pp. 1247-8.

2/ Ibid., p. 1255.

3/ Federal Maritime Commission, Fact Finding Investigation No. 6: The Effects of Steamship Conference Organization Procedure, Rules, Regulations and Practices Upon the Foreign Commerce of the United States; Aug. 16, 1967; pp. 144-46.

A carrier may be receiving a large share of government cargo either by allotment from the government without competition or through the more limited competition of other American flag lines. When this carrier is asked to reduce the rate on that particular commodity to enable a commercial commodity to move. . .there would obviously be a tendency on its part to vote to maintain the higher rate level and protect the revenue it is already receiving from the government shipments. 1/

The result is an increased disparity in rates between the outbound and inbound trade routes.

The UNCTAD Secretariat in a report on "The Regulation of Liner Conferences (Code of Conduct for Liner Conference System)" suggested the 40-40-20 formula that cargo should be shared equally by the flag lines of the countries whose trade is carried; third-flag carriers may participate but should carry no more than 20 percent of the cargo among them.

#### Means of changing conference rates

Insofar as the U.S. outbound rates are a good deal higher than those inbound, discrimination is involved. If this discrimination is found to be a real barrier to the trade of a commodity, there are mechanisms which can be employed to change the rate. Some of the most exorbitant U.S. outbound rates have an end result of adding only a few percent on the overseas selling price of the U.S. export, but this creates a deterrent to sales abroad for the U.S. product which is only marginally competitive in a foreign market. If a commodity's price is just low enough to compete overseas, the extra percentage that a high

---

1/ Ibid., p. 147.

shipping cost will add to that price may destroy the product's competitive position.

There are several ways of avoiding the normal conference rates. A charter ship's rates are lower than the usual conference rate, if the shipper is able to hire an entire vessel (not a likely situation for the marginal competitor). If the shipper does not require regularly scheduled service, a tramp ship will carry freight for less. Within the conference, there is official machinery for handling requests for rate changes although it has been questioned how often the shipper obtains favorable results from this procedure. The structure of the conference usually also provides for a dual rate system. If a shipper is willing to send his goods exclusively within the conference for a particular length of time, the conference will apply lower rates. 1/

In many nations like Japan and the United Kingdom, there is another force which helps shippers to obtain rate changes. These are the strong national shippers councils which negotiate with the conferences on rates and services and have shown themselves very able to get results from the conferences in areas where governmental agencies have been ineffective. Shippers councils in the United States have not been able to organize themselves to the effective strength of those of other countries. However, it may be that shippers councils in the United States would be liable to antitrust prosecution.

---

1/ This system is distinctive from the deferred rebate system which is illegal in the United States. Under this system, instead of an immediate discount, the shipper must wait for a deferred rebate payable sometime after the actual shipping takes place.

Finally, there is a growing trend in the shipping world which could possibly put an end to the shipping rate disparity issue entirely: that is containerization. The development of containerization should cut down on the high U.S. cost of loading and discharging. Commodity rate classifications would be tremendously simplified by the widespread, systematic use of standard containers and container ships. Commodities could be organized into groups referred to simply as "class 1," "class 2," etc. Rates would be based on the weight and value of one container filled with a commodity.

For example, if 1,000 Japanese typewriters, weighing 20,000 pounds and with a total value of \$50,000 can be carried in one container and 500 U.S. typewriters, weighing 20,000 pounds and with a total value of \$50,000 can be carried in the same container, then these commodities should fall under the same commodity "Class". Then, a flat rate per one container of this commodity "Class" could be established, which would be the same rate for both directions. 1/

The disparity issue would be ended and the conference rate system made immeasurably simpler.

Though the growth of containerization has been dramatic, complaints still point to ocean freight rate disparities as a nontariff trade barrier. However, the extent to which disparities retard the U.S. export situation is unsure, as is the solution for an effective end to this problem.

### PRODUCT SECTORS: SOME GENERAL OBSERVATIONS

#### Introduction

Chapter IV of this report presents and discusses average tariff levels of the United States, Canada, Japan, the European Community, and the United Kingdom, chiefly in terms of large aggregate averages for "all industrial products" and "all agricultural products," and summarizes the theoretical and methodological considerations which are to be borne in mind in making any international comparison of tariff levels. That chapter also contains some summary tariff data for lower levels of product aggregation in which industrial products are subdivided into 23 product sectors, and agricultural products into 9 sectors.

Chapter VI discusses the overall nature and extent of concessions contained in trade agreements to which the United States is a party. In chapters VII through XII, nontariff barriers are discussed in detail, principally by category or type of barrier.

The purpose of this third part of the report is to present tariff comparisons in greater detail and at a much lower level of product aggregation where the averages become more meaningful, to give a more detailed indication of the change which has occurred in average tariff levels of smaller product groups since inception of the trade-agreements program, and to relate nontariff trade barriers more directly to the specific products upon which they impinge.

In this part of the report, comparisons of MFN tariff levels of the United States, Canada, Japan, the European Community, and the United Kingdom are made for each of the 23 industrial product sectors and 9

agricultural product sectors, first described in Chapter IV, at the sector level as a whole and for the most important categories of products within the sector. Average duty levels of each country are presented, together with the distribution, by duty level, of each country's MFN tariff provisions and MFN imports in the sector. The trade importance of the sector is discussed in terms of the volume of trade and the direction of trade flows among the five major markets under consideration. An effort has been made to show the overall reduction which has occurred in each of the five tariffs under examination since the United States first negotiated with the respective countries for mutual tariff reductions under the reciprocal trade-agreements program. And finally, complaints submitted to the Commission during this investigation against tariffs or other trade barriers or practices affecting products in the sector are summarized.

The 32 sectors, which are numbered and discussed in the order of their importance in total export trade of OECD countries 1/ in 1969, are listed in table 13-A.

In each of the product sectors are found tables showing the network of trade in the particular product among the United States, Canada, Japan, the European Community, the United Kingdom, other OECD countries, and non-OECD countries (including a subtotal for less developed nations). The primary purpose of these tables is to show trade patterns and the

Source: Compiled from OECD Statistics of Foreign Trade, Series C.

directions of trade flows to assist in assessing the significance of relative duty levels on trade among the major trading nations. The secondary purpose is to give an indication of the general order of magnitude or importance of trade in the product area.

The trade data given in the tables are for 1969, which was the latest year for which OECD trade statistics were available when most of the basic statistical work for this report was completed. It has been possible to include in the text some of the 1970 OECD trade data which recently became available.

There has been a substantial increase in world trade since 1969, and the magnitude of the increase for the United States, Canada, Japan, the European Community, and the United Kingdom is shown in table 13-B. However, in general, the patterns of trade flow shown in the trade network tables for the product sectors remain the same.

Chapter IV has discussed the problems of achieving comparability in tariff and trade product categories necessary for any comparison of tariffs among nations. As explained in detail in Chapter IV, this comparability has been accomplished for the present study by using as "building blocks" the product categories (headings) of the Brussels Tariff Nomenclature (BTN), which is used by all important trading nations except the United States and Canada. It has, of course, been necessary to translate U.S. and Canadian tariff and trade data into the BTN format. The exact coverage of each product sector is specified in terms of BTN headings, and the full description of each BTN heading is given in the appendix to this chapter.

Source: For the United States, U.S. Foreign Trade: Highlights of Exports and Imports, January 1973, pp. 21 and 63. For Canada, Japan, and the United Kingdom, for the years 1969 and 1970, United Nations Statistical Office, Statistical Yearbook, 1971; and for 1971 and 1972, import data were obtained from Commerce Today, U.S. Department of Commerce, Apr. 30, 1973, pp. 36 and 37 and export data were obtained from the 16th and 17th annual report of the President of the United States on the trade agreements program, 1971 and 1972. For the European Community, data were obtained from Foreign Trade: Monthly Statistics issued by the European Community's Statistical Office.

### Comparing average tariff levels

Problems in comparing national customs tariffs, especially at aggregate product levels, have been discussed in detail in Chapter IV of this report, but the principal points to be kept in mind while examining the comparisons made in the following pages bear restating.

First, when dealing with a single product, the level of the tariff usually can be clearly indicated. However, when products which are subject to different tariff rates must be aggregated in order to discuss a large category of products, there is no satisfactory method for averaging the various rates to express in a single figure an unbiased average tariff. Nevertheless, the most practical method for wide-ranging comparisons is in terms of groups of products, and one must therefore resort to averages. As indicated in Chapter IV, in preparing the GATT Tariff Study it was recognized that agreement among the GATT contracting parties could never be achieved on a single average as the "fairest" indicator of a country's tariff level; thus, four averages -- a simple arithmetic average and three averages weighted in different ways -- were calculated, thereby enabling each country to select an average it preferred for the purpose at hand.

For comparing national tariff levels in the present report, the simple arithmetic average and an average weighted by the country's own imports are used. These have been selected primarily for two

reasons: Their simplicity of concept, and the fact that they are widely presumed to represent the two extremes of bias, and therefore, should be indicative of the range in which the true average is found. On the theory that a country's imports will be greatest in products with low rates of duty, and smallest in products with high restrictive rates, an average of tariffs weighted by the country's own imports entering at the various rates of duty is presumed to have a strong downward bias. On the other hand, a simple arithmetic average that gives equal weight to every line provision is presumed to be biased upward, in part because national tariff nomenclatures tend to be more detailed in categories of dutiable products where protection is desired, and far less detailed for duty-free or low duty articles. However, it has been shown in Chapter IV and also will be seen in the tariff comparisons which follow that there are numerous cases where the relative position of these averages does not conform to the popular notion of their direction of bias.

A second point to be borne in mind is that the comparisons made here are based on MFN rates of duty only. Provisions for non-MFN tariff treatment (i.e., either preferential or "statutory"), and trade under those provisions, have not been used in calculating the averages. Of the two classes of exclusions, preferential tariffs and trade are by far the most important; their inclusion in the calculations would in many cases place the average duty levels significantly below the

level calculated on MFN provisions alone, but their existence heightens the restrictive impact of the MFN duty on imports not enjoying the preferential treatment. For the past several years, preferential treatment has been given imports into Canada from Commonwealth countries, into the United Kingdom from Commonwealth and EFTA countries, into the European Community from associated countries and territories, and into the United States from the Philippines and, for automotive products only, from Canada. Under these preferential arrangements, almost 20 percent of industrial product imports into the United Kingdom in 1970 were given preferential treatment, as were 11 percent of U.S. industrial imports, 4 percent of Canadian imports, and about 1 percent of shipments into the European Community from outside sources; Japan's preferential imports were negligible.

In each of the product sectors will be found an indication of the portion of imports of the five major countries which has entered with preferential tariff treatment. However, these data reflect trade flows under preferential arrangements as they existed prior to 1972, and preferential tariff arrangements are in the process of changing significantly. A series of new preferential agreements has been made between the European Community and the EFTA countries not acceding to Community membership; many developed countries have implemented, or are planning, generalized tariff preferences for products of LDC's; and Commonwealth preferences are expected to be

modified or phased out after entry of the United Kingdom into the European Community.

Also excluded from the calculations of duty averages used here is trade within the customs union of the European Community (West German imports from France, Italian imports from West Germany, etc.), which moves duty free and is considered for customs purposes an internal transaction (not imports). The value of intra-EC shipments is only 10 percent less than EC imports from outside sources.

Another important consideration in any comparison of tariffs is the system for determining the customs value of a product upon which ad valorem duties are assessed. The intricacies of this problem are summarized in Chapter IV and discussed in detail in a recent report on customs valuation submitted to the Committee on Finance of the U.S. Senate. <sup>1/</sup> Suffice it to say here that the United States and Canada use a system which determines the value usually in the country of export (an "f.o.b. system") whereas the European Community, the United Kingdom and Japan (and most other countries of the world) use a system which determines the value usually at the port of entry into the importing country (a "c.i.f. system").

Since the c.i.f. value is greater than the f.o.b. value of a product (by virtue of inclusion of insurance and freight charges)

---

<sup>1/</sup> See Customs Valuation, Report of the U.S. Tariff Commission to the Committee on Finance, March 1973.

an ad valorem rate applied to the c.i.f. value collects more absolute duty than the same rate applied to the f.o.b. value. This difference can be significant for individual products which bear high freight or insurance charges. In large aggregates, however, it becomes less important. The differences are discussed in Chapter IV in terms of U.S. tariff averages. There it is shown that for the 23 industrial sectors, if U.S. duty collections had been applied to c.i.f. rather than f.o.b. values for calculation of average duties, in no sector would the average duty level have been lower by more than 1.5 percentage points.

Finally, the reader should understand that generalized conclusions on the restrictive effect on a tariff, based solely on whether the nominal rate appears to be relatively "low" or "high," are seldom warranted. A growing number of academic studies are showing that the effective tariff protection of a given nominal rate for a product can vary widely among countries; "low" nominal rates can be extremely restrictive, while "high" nominal rates have been shown to have an unexpectedly low restrictive effect. 1/

The average tariff levels in this report were calculated using the final stage of Kennedy Round rates, which became effective on January 1, 1972, for the United States, the European Community, and the United Kingdom; on July 4, 1969, for Canada, and on April 1, 1971, for Japan. The averages for Japan do not reflect the unilateral duty

---

1/ For a discussion of "effective" levels of protection, see the section entitled "'Effective' Versus Nominal Tariff Rates" in Chapter IV, Tariffs.

reductions (for the most part, of approximately 20 percent) which Japan made in 1972 on most industrial products and some agricultural products. They also do not reflect the temporary reductions made by Canada in February 1973 on a wide range of products, particularly consumer goods, by an average of 5 percentage points. The Canadian reductions covered roughly 10 percent of Canada's total imports and 20 percent of dutiable imports. The weighted averages for the 32 sectors were calculated using 1970 import data. At the subsector level, weighted averages for agricultural products were also based on 1970 imports; for industrial product subsectors, the calculations were made on 1967 imports. The industrial product averages have been taken from basic documentation prepared for the GATT Tariff Study. The agricultural product averages are calculations made by the Tariff Commission.

#### The effect of European Community enlargement

The tariff and trade data on the European Community presented in this report are for the Community as it existed prior to 1973, comprised of six nations: Belgium, France, Luxembourg, Netherlands, Italy, and West Germany. On January 1, 1973, the Community was enlarged to include three additional countries (the United Kingdom, Denmark, and Ireland) whose tariffs on goods from non-EC countries are being aligned gradually over a five year period to conform with the Community's Common External Tariff, while tariffs on trade of the six original members with

newly acceding countries will be gradually removed. 1/

The effect of EC enlargement on the tariff averages contained in this report is that over the next few years the tariff averages shown for the United Kingdom will move toward the levels shown for the European Community, and at the end of the alignment period be incorporated into the EC averages. Since the vast majority of EC rates are ad valorem, the EC arithmetic average will not significantly change, but the weighted average can undergo some change due to changes in the trade used for weighting. The magnitude and direction of the changes in the weighted average is not known.

#### Measuring the "extent of tariff concessions"

To respond to that part of the Senate Finance Committee's request to the Commission dealing with the extent of tariff concessions granted in trade agreements, an effort has been made to determine the "pre-trade agreement" average level of tariffs of the United States, Canada, the United Kingdom, Japan, and the European Community for comparison with the averages of today.

Problems inherent in comparing average tariff levels at a single point in time are further compounded when comparing average levels over

---

1/ The schedule of installments for the alignment of the tariffs of the acceding countries to the Common External Tariff is as follows: 40 percent on January 1, 1974, and 20 percent each on January 1, 1975, January 1, 1976, and July 1, 1977. The schedule of installments for removing the tariffs on internal trade in the enlarged Community is as follows: 20 percent each on April 1, 1973, January 1, 1974, January 1, 1975, January 1, 1976, and July 1, 1977.

a period of time, especially if the purpose of the comparison is to determine or measure the amount of change due to a single factor, such as modification in the nominal rates of duty.

The change in a country's average tariff level over time is a function of three factors: Changes in the individual nominal rates of duty in the tariff schedule; changes in the prices of products subject to specific rates of duty; and changes in the composition of imports, which are used as weights in calculating the average level of the tariff. An examination of the following statistics on U.S. imports, duties collected, and average duty levels in 1932 and 1972 will illustrate the operation of these three factors.

	<u>1932</u>	<u>1972</u>
Total U.S. imports-----	\$1,325.0 million	\$55,282.3 million
Free:		
Value-----	\$885.5 million	\$18,911.8 million
Percent-----	66.8	34.2
Dutiable:		
Value-----	\$439.6 million	\$36,370.5 million
Percent-----	33.2	65.8
Duty collected-----	\$259.6 million	\$3,123.7
Average ad valorem duty level:		
Total imports-----	19.6% ad val.	5.6% ad val.
Dutiable imports-----	59.1% ad val.	8.6% ad val.

Import duties collected by the United States in 1932 were equal to 19.6 percent of the value of total imports, and 59.1 percent of dutiable imports; 1972 duty collections equaled 5.6 percent of the value of total imports, and 8.6 percent of dutiable imports. This very substantial decline in the average tariff level is the net result

of contradictory forces. Between 1932 and 1972, there was a remarkable change in the composition of U.S. imports, one aspect of which is illustrated by the shift in ratios of dutiable and free products. If other factors (intentional rate reductions and inadvertent rate reductions through price increases of specific duty products) had not intervened, this change in product composition undoubtedly would have resulted in a higher average duty level in 1972 than in 1932. The direction of force of both the other determining factors, however, was downward, and they were of sufficient strength to more than counterbalance the upward push from the greater importation of dutiable merchandise. The majority of tariff rates were cut during the period by 50 percent or more in trade negotiations. The very significant rise in the general price level between 1932 and 1972 meant a correspondingly significant drop in the ad valorem equivalent of specific duties.

The relative strength of these two downward forces has never been determined. The trade agreement cuts in duties are believed to have contributed more to lowering the U.S. average tariff level than the reductions resulting from inflation. However, because almost 40 percent of U.S. duties are specific rates, inflation has been a very important factor in lowering the level. An illustrative example of its significance can be found in a product such as potatoes, imports of which had a unit value of 68 cents per 100 pounds in 1932, and \$2.75 in 1972. The 1932 duty was 75 cents per 100 pounds, equivalent

to 110 percent ad valorem in terms of 1932 prices, and 27.2 percent ad valorem in terms of 1972 prices. The price rise, in effect, lowered the duty by 83 percentage points. In a trade-agreement concession to Canada, the duty was cut 50 percent to 37-1/2 cents per 100 pounds on a specified amount of imports each year. The ad valorem equivalent of this reduced duty today is only 13.6 percentage points lower than the duty would be if no trade-agreement concession had been made.

It has not been possible to isolate the effect of each of the three determinants of change in average tariff levels over time in order to indicate clearly that a specific amount of the change measures the "extent of tariff concessions." Nevertheless, it is felt that the calculations which have been made give a reasonable estimate of the order of magnitude of reductions in tariff levels made by tariff concessions.

The methodology for calculating the pre-trade-agreement average tariffs is described in Chapter V of this report. The type of averages which were calculated are as follows:

	<u>Industrial products</u>	<u>Agricultural products</u>
United States	Own-trade-weighted	Simple arithmetic
European Community	Own-trade-weighted	Simple arithmetic
United Kingdom	Own-trade-weighted	Simple arithmetic
Japan	Own-trade-weighted	Simple arithmetic
Canada	Simple arithmetic	Simple arithmetic

For industrial products, the appropriate trade data for Canada were not available to permit calculation of an own-trade-weighted average for pre-trade-agreement Canadian tariffs, and it was therefore necessary to use an arithmetic average to indicate the extent of reduction in Canada's tariff level. <sup>1/</sup> For agricultural products, arithmetic averages are used for all countries.

The averages were calculated using tariff rates in effect just prior to the first negotiation between the respective country and the United States for reciprocal tariff reductions under the Trade Agreements Program. Thus, the pre-trade-agreement "base dates" differ for each country and are as follows: United States, 1934; Canada, 1934; Japan, 1954; European Community, 1960; United Kingdom, 1937.

The pre-trade-agreement average duties of the Community already reflect a large number of tariff reductions made in trade agreements prior to formation of the Community. The autonomous, or "pre-trade-agreement," rates of the Community were established, for the most part, by taking an arithmetic average of the duties applied in the four customs territories of the Community on January 1, 1957. Each of the four pre-existing tariffs contained reductions which had been negotiated in bilateral agreements with the United States under

---

<sup>1/</sup> Canadian arithmetic and own-trade-weighted averages frequently differ significantly. The reader should examine these differences, given in each product sector, for closer comparability of the Canadian figures with figures for other countries for industrial products.

the GATT. Since the EC's Common External Tariff was established, European Community rates of duty have been reduced in two GATT negotiations: The Dillon Round, concluded in 1962, and the Kennedy Round, concluded in 1967.

#### Trade complaints

For the preparation of this report, the Commission solicited from all interested parties information on barriers to trade, emphasizing that information on barriers other than tariffs was particularly desired. A substantial number of complaints was received from firms and trade associations, as well as government sources and other public organizations. The complaints dealing with specific products are summarized in the appropriate product sectors which follow.

The common thread running through most of the complaints received from U.S. exporters and importers was their belief that the practices or policies which they reported placed them at a competitive disadvantage either by withholding from them opportunities or benefits available to their competitors, or simply by increasing the cost of delivering their product to the ultimate consumer. Complaints from U.S. producers concerned with foreign competition in the domestic market usually were simply the obverse image of complaints from exporters and importers, that is that the complained-of practices or policies provided the imported product with a competitive opportunity or advantage not available to the domestic producer, and frequently lessened the cost of delivery of the foreign product in the U.S. market. Although the reported measures undoubtedly affect the competitive position of the

complainant, many are not presently included under the rubric "barriers to trade." An example is the nondiscriminatory sales tax, applicable equally to imports and domestic products. Nevertheless, it is thought useful to report these complaints.

In tabulating the trade complaints, each barrier reported by a respondent in the Commission's survey has been counted one time for each country in which the respondent reported encountering the barrier. Thus, for example, if a manufacturer stated that his shipments to countries X, Y, and Z are subject to import licenses, this was counted as three complaints. The total number of complaints against a particular practice or trade barrier in a product sector may generally be taken as indicative of the significance of the barrier for trade in that sector. However, a few instances were noted where this is not the case because trade in that particular product is concentrated in relatively few firms, and consequently few complaints were submitted.

### Terminology

For simplicity and conciseness of exposition, the following terms are used, with the meanings indicated, in discussing the product sectors:

Five major countries -- The United States, Canada, Japan, the United Kingdom, and the European Community (as constituted of six countries before enlargement in January 1, 1973).

Five major tariffs -- The tariff schedules of the five major countries.

The European Community (or the Community) -- The customs union existing prior to January 1, 1973, comprised of Belgium, France, Italy, Luxembourg, the Netherlands, and West Germany.

Intra-Community exports, intra-Community imports -- Trade between member countries of the European Community.

GATT Tariff Study countries -- The United States, Canada, Japan, the United Kingdom, Sweden, Denmark, Norway, Finland, Switzerland, Austria, and the European Community, when the reference is to tariff or trade data prior to 1970. When reference is to 1970 data, the group includes Australia and New Zealand.

Industrial products -- Products classified in Chapters 25-99 of the Brussels Tariff Nomenclature.

Agricultural products -- Products classified in Chapters 1-24 of the Brussels Tariff Nomenclature.

Sectors, subsectors -- Sectors are the 23 major industrial product categories and the nine major agricultural product categories. Subsectors are subgroups of products within sectors. The industrial sectors are the same as those used by the GATT contracting parties in the GATT Tariff Study. Agricultural sectors are based on definitions developed primarily by the Tariff Commission staff.

OECD, OECD countries -- The Organization for Economic Cooperation and Development (OECD) is an international organization established by a convention signed in Paris in 1960 to encourage economic growth and high employment with financial stability among member countries, to contribute to the economic development of less advanced countries, and to expand world multilateral trade. OECD member countries in

the years for which the basic trade data in this report are based (1969 and 1970) were as follows:

Austria	Iceland	Spain
Belgium	Ireland	Sweden
Canada	Italy	Switzerland
Denmark	Japan	Turkey
Finland	Luxembourg	United Kingdom
France	Netherlands	United States
West Germany	Norway	
Greece	Portugal	

Australia became a member in 1971, and New Zealand joined in 1973, but trade of these countries is not included in OECD trade data discussed in this report.

Imports -- The statistics of imports used in this report are principally from two sources, the OECD and the GATT. GATT import data exclude intra-EC shipments; OECD data include intra-EC shipments. For clarity, an effort has been made to specify the coverage in every case.

General rate, autonomous rate, statutory rate -- Rates of duty which would be applicable in the absence of trade-agreement concessions in Canada and Japan (general rate), the European Community (autonomous rate), and the United States (statutory rate). These terms are also used in describing "pre-trade-agreement" rate levels of these countries.

CHAPTER XIII

APPENDIX

Appendix table 13-A.--Product sectors: Coverage in Brussels Tariff Nomenclature headings and Standard International Trade Classification categories

Sector	Brussels Tariff Nomenclature headings	Standard International Trade Classification categories
<u>Industrial Sectors</u>		
I-1 <u>Nonelectrical machinery</u>		
Power-generating machinery-----	84.01-08	711 excl. 711.7; 719.1(1)
Agricultural machinery and appliances-----	84.24-28	712 excl. 712.3(1) & 712.5
Office machines-----	84.51-55	714
Metalworking machinery-----	84.43-45; 84.50	715
Textile and leather machinery-----	84.36-42	717; 725.0(2)
Construction, mining & handling equipment-----	84.09; 84.22-23; 87.07	718.4; 719.3
Other machine tools-----	84.46-49	719.5
Pumps-----	84.10-11; 84.18	712.3(1); 719.2
Heating and cooling equipment-----	73.36-37; 84.12-15	697.1(1); 719.1 excl. 719.1.1 & 719.1(9); 719.4(2); 725.0(1); 812.1
Pulp and paper machinery-----	84.31; 84.33	718.1
Bookbinding machinery-----	84.32; 84.34-35	718.2
Other machines-----	84.16-17; 84.19-21; 84.29-30; 84.56-59; 86.10	711.7; 718.3; 718.5; 719.1(9); 719.4(3); 719.6; 719.8
Parts and accessories-----	84.60-65	719.7; 719.9
I-2 <u>Transport equipment</u>		
Motor vehicles-----	87.01-06; 87.09; 87.12	712.5; 732; 733.1(2)
Aircraft-----	88.01-03	734
Ships and boats-----	89.01-05	735
