Introduction

This report, published pursuant to section 7(d) of the Trade Agreements Extension Act of 1951, as amended (19 U.S.C. 1364(d)), sets forth the finding and conclusion of the U.S. Tariff Commission in connection with an investigation (No. 7-98) to determine whether cantaloups in their natural state, provided for in paragraph 752 of the Tariff Act of 1930, are, as a result in whole or in part of the customs treatment reflecting the concession granted thereon under the General Agreement on Tariffs and Trade, being imported into the United States in such increased quantities, either actual or relative to domestic production, as to cause or threaten serious injury to the domestic industry producing like or directly competitive products.

On September 30, 1960, the Western Growers Association, 1/
Los Angeles, Calif., filed an application for an investigation under
section 7 of the Trade Agreements Extension Act of 1951, as amended,
with respect to fresh cantaloups. The Commission instituted the
investigation on October 25, 1960; public notice of the investigation
and of the public hearing to be held in connection therewith was given

^{1/} The Western Growers Association represents growers in California and Arizona. Growers in other important cantaloup-producing States, such as Texas, Georgia, and the Middle Atlantic and Great Lakes-area States, are not represented by the association and were not parties to the application.

by posting copies of the notice at the office of the U.S. Tariff Commission in Washington, D.C., and at its office in New York City, and by publishing the notice in the <u>Federal Register</u> (25 F.R. 10584) and in the November 3, 1960, issue of Treasury Decisions.

The public hearing was duly held on February 7 and 8, 1961, and all interested parties were afforded opportunity to be present, to produce evidence, and to be heard. In addition to the information obtained at the hearing, information pertinent to the investigation was obtained from the Commission's files, from other Government agencies, and through interviews by members of the staff with growers, shippers, importers, receivers in terminal markets, including chainstore buyers, officials of the California Department of Agriculture, marketing experts associated with the University of California, and personnel in the U.S. Department of Agriculture.

Finding and Conclusion of the Commission

On the basis of this investigation, including the hearing, the Tariff Commission unanimously finds that fresh cantaloups are not being imported in such increased quantities, either actual or relative to domestic production, as to cause or threaten serious injury to the domestic industry producing like or directly competitive products. Accordingly, in the judgment of the Commission, no sufficient reason exists for a recommendation to the President under the provisions of section 7 of the Trade Agreements Extension Act of 1951, as amended.

Considerations Bearing on the Commission's Finding and Conclusion

The finding and conclusion stated above are based principally upon the following considerations:

U.S. customs treatment

The imports of cantaloups to which this report relates were not specially provided for in the Tariff Act of 1930. They were originally dutiable under the provision in paragraph 752 for "fruits in their natural state," at 35 percent ad valorem. Pursuant to a concession granted in the General Agreement on Tariffs and Trade (GATT), effective January 1, 1948, the duty on cantaloups entered during the period August 1 to September 15, in any year, was reduced to 25 percent ad valorem. Subsequently, pursuant to later concession granted in the GATT, effective in 1951, the seasonal rate was further reduced to 20 percent ad valorem. The duty on cantaloups entered during the period September 16, in any year, to the following July 31, inclusive, is the statutory rate of 35 percent ad valorem. The preferential rate on cantaloups from Cuba is 14 percent ad valorem regardless of the time of year in which they enter. 1/ Although the 35-percent duty is not a reduced rate, it is a concession rate by virtue of the obligation under article 1 of GATT not to increase the absolute margin between the duty on articles imported from Cuba and the duty on nonCuban articles.

^{1/} The preferential rate of duty on cantaloups imported from Cuba was originally 28 percent ad valorem under the act of 1930; the rate was reduced, effective Jan. 5, 1942, to 14 percent ad valorem, which is the current rate applicable to Cuban cantaloups.

In the past few years virtually all U.S. imports of cantaloups have been dutiable at 35 percent ad valorem, the statutory rate.

Imports of cantaloups at the seasonally reduced rate of 20 percent and at the Cuban rate of 14 percent have been nil or negligible.

Description and uses

Although the terms "cantaloup" and "muskmelon" are popularly used interchangeably, muskmelon is the broader term. It embraces not only cantaloup but also various other melons, such as Honey Ball, Honey Dew, Persian, Cassaba, and Cranshaw. Cantaloups account for about 85 percent of the total U.S. production of all the aforementioned melons. As the term cantaloup is used hereafter in this report it refers solely to the familiar small dark-skinned, netted, salmonfleshed melon. The domestic production and imports of melons other than cantaloups are not covered by the present investigation. Despite their popularity, cantaloups are difficult to grow success-They require a long growing season, and as the crop matures fully. it becomes increasingly subject to the hazards of weather, insects, and disease. Cantaloups appear to flourish best and attain peak flavor and appearance in a hot, dry climate. In the United States the bulk of the production occurs in the arid and semiarid regions where water for irrigation is available.

Although cantaloups may be grown on many types of soils ranging from sand to clay loams they do best on well-drained sandy loams or silt-loam soils. An abundance of moisture during critical periods is essential. It is estimated that more than 80 percent of the domestic crop is grown under irrigation.

In the southwest cantaloups are planted so that the harvest may begin as early as possible in the spring. Occasionally, harvesting may begin as early as late April but volume harvesting usually doesn't begin until the latter half of May. The earliest plantings are generally protected during frost periods by individual paper "caps."

In addition to the expense involved in irrigation and capping of the early crop, considerable expense is involved in dusting or spraying the crop to protect it against disease and insect infestation. The difficulty in controlling such diseases as mosaic, crown blight, and mildew is one of the principal reasons for the decline in acreage, yield, and production of cantaloups in the Imperial Valley of California. 1/

^{1/} Production of Muskmelons in California, Circular 429, 1953, California Agricultural Experiment Station.

Cantaloups are popularly consumed as an appetizer, a salad, or a dessert in their fresh state. Small quantities are marketed in the form of frozen melon balls.

U.S. industry

As previously stated, the purpose of this investigation is to determine whether cantaloups are being imported in such increased quantities as to cause or threaten serious injury to the "domestic industry producing like or directly competitive products."

Applicants urged the Commission to consider the "domestic industry" involved as being limited to the producers of cantaloups in the desert regions of Arizona and California, who harvest virtually all of their production in the spring. These regions account for all of the supply of cantaloups during this season except for small quantities grown in Texas and Florida; other geographic areas produce the melons marketed at other seasons of the year.

The Commission has already ruled, in connection with the recent investigation on cast-iron soil-pipe fittings, that the injury question in an escape-clause case must be determined on the basis of the impact of imports on the totality of domestic production of the like or directly competitive product, and not on the production of an individual firm or group of firms located in a particular geographic area that represents only a portion or segment of the total domestic production. 1/ Separation of national production of

^{1/} U.S. Tariff Commission, Cast-Iron Soil-Pipe Fittings: Report on Escape-Clause Investigation No. 7-87 * * *1960 (processed).

a commodity into separate "seasonal" industries would skirt the "industry as a whole" concept enunicated by the Commission in the cast-iron soil-pipe-fittings case. Under the applicants' theory, multiple industries involving the production of the same product at different times of the year would exist for many products. Thus, there could be a spring-production industry, a summer-production industry, a fall-production industry, and a winter-production industry. Indeed, as the applicants suggest in their brief, there may even be an <u>early</u>-spring-production industry, a <u>late</u>-spring-production industry, and so on. The Commission finds no basis for departing from its ruling in the cast-iron soil-pipe fittings case.

The crux of the argument that the "domestic industry" in the instant case should be limited to growers of cantaloups in Arizona and California lies in the fact that these growers are the predominant source of domestic production during the period of the imports being complained of. Nothing in section 7, however, suggests that the Commission must or should limit its consideration in escape-clause investigations to the impact of imports on that part of the domestic production which takes place contemporaneously with or proximate in time to the imports in question. Indeed, all indications are to the contrary.

In reaching the foregoing conclusion, we were not unmindful of the holding by the Director of Agriculture in California that the production of summer cantaloups constitutes an industry separate and distinguishable from the production of spring cantaloups. The occasion for that holding, however, arose under the terms of the California Marketing Act of 1937, not under the Federal statute which governs our proceedings, and therefore it is of no probative value in determining the meaning of the term "domestic industry" in section 7. U.S. production

Although cantaloups are grown in all States of the Union, commercial production occurs principally in 26 States (table 1 in the appendix). Four seasonal groupings are commonly recognized: Spring, early-summer, midsummer, and late-summer. About 33 percent of the total U.S. production is harvested in spring, 13 percent in early summer, 44 percent in midsummer, and 10 percent in late summer. About 80 percent of the spring crop (the only one affected in any degree by imports) is produced in southern California and Arizona. Before 1940, California produced almost all of the spring crop, but since then the Yuma area in Arizona has become increasingly important and in most recent years has outproduced California during the spring season.

About 37 percent of the early-summer crop of cantaloups is produced in Arizona; Georgia and South Carolina are the other major producers. California is by far the principal midsummer producing State, with 70 percent of the total; Indiana, Texas, North Carolina, Missouri, and Maryland account for most of the remainder. The latesummer crop of cantaloups is produced principally in Michigan, Colorado, Ohio, and New York.

It should be noted that the grouping of States under the four producing seasons in table 1 is based primarily on the usual planting time in the various growing areas. It is not uncommon, however, for the crop in a given region to be delayed by weather, in which case most of the cantaloups from that region may be harvested after the normal marketing season at a time when the cantaloups from other areas are ready for market. Moreover, the groupings in table 1 obscure the fact that cantaloups from one region or another in California are produced and marketed in volume without interruption from the end of May to the end of October.

Hence, these groupings give only a very general idea of the time of harvest and conceal overlapping of supplies, not having been designed to provide a precise or restrictive delineation of the seasons applicable to domestic cantaloup production.

Total U.S. production of cantaloups has varied only slightly from year to year since 1947, ranging from 1.1 billion pounds in 1949 to 1.3 billion pounds in 1954 (table 2). Since 1954, production has amounted to somewhat more than 1.2 billion pounds annually except in 1957, when a reduction in acreage severely reduced the early California and Arizona output. The nearly constant production is in contrast to the output of most other fruit and vegetable crops, which normally fluctuates widely from year to year. The stability in output of cantaloups is attributable principally to the fact that the bulk of the crop is produced under irrigation, and to improved technology, and to a gradual shifting of production to higher yielding areas from

those which are tending to decline in output. Because cantaloups are produced in many regions of the United States, crop failures in particular areas tend to be offset by increases in output in other areas.

The farm value of the U.S. cantaloup crop rose from \$314 million in 1949 to \$56 million in 1957, representing an increase of about 65 percent. In 1959, the value of the crop was \$55 million, and in 1960, \$53 million.

U.S. exports

U.S. exports of melons (except watermelons), consisting largely of cantaloups, have increased markedly since 1947. Exports ranged from less than one-half million pounds in 1948 to 29 million pounds in 1959 (table 2). Canada is the major market (table 3). In recent years U.S. exports of cantaloups have been equivalent to about 50 percent of the quantity imported.

U.S. imports

Cantaloups for the U.S. market are imported principally from Mexico; minor quantities have also been imported from Cuba in spring and from Canada in late summer. In Mexico the principal growing areas center in the so-called east coast or Apatzingan area and the west coast or Culiacan-Bamoa area. Both areas produce cantaloups principally for delivery to the U.S. market during the period from January to May or June (table 4). Imports from the Apatzingan area begin somewhat earlier than those from the Culiacan-Bamoa area.

As in the United States, the growing of early cantaloups in Mexico is an exceedingly hazardous enterprise. Yields per acre fluctuate widely from year to year and depend in large measure upon whether frost or rains occur during critical periods, the prevalence of plant diseases, and the grower's ability to minimize the effect of such diseases on his crop.

The growing of cantaloups, particularly in the Culiacan-Bamoa area of Mexico, is mainly concentrated among Mexican growers, producing on large plantings of up to a thousand acres. According to information obtained from trade sources (including large growers in southeastern United States, terminal-market operators on both the east and west coasts of the United States, lending institutions, and Government marketing officials), it appears that at least 75 percent of the Mexican cantaloup operation is financed by U.S. capital.

U.S. imports of cantaloups averaged about 6 million pounds annually in the years 1949-52. Thereafter imports increased markedly, reaching a record high of 79 million pounds, valued at \$4 million, in 1960 (table 2). In 1955, imports were equivalent to about 2.9 percent of total domestic output, based on quantity. The ratios of imports to domestic output in succeeding years have been as follows:

1956 4.3		1959		
1957 4.6	percent	1960	0.4	percent
1058 3.5	percent.			

U.S. imports by customs districts

The principal ports of entry for cantaloups imported into the United States are Nogales, Ariz., and Laredo, Tex. In most recent years more than 90 percent of U.S. imports have entered through these two ports of entry (table 5). Most of the cantaloups grown in the Apatzingan area of Mexico passed through Laredo and virtually all those grown in the Culiacan-Bamoa area, through Nogales. As production has increased during recent years in the Culiacan-Bamoa area, entries through Nogales have increased, and that city currently rivals Laredo as the principal port of entry. Generally imports coming through Laredo begin earlier in the year than those entering at Nogales; the peak month for Laredo is usually April, and that for Nogales is usually May.

The U.S. Department of Agriculture Plant Quarantine Branch and the Customs Service maintain offices at these cities, thus permitting quick inspection and appraisal of the cantaloups destined for entry. During the season sales offices representing buyers as well as sellers operate at these entry points, thus facilitating the rapid disposition of the cantaloups.

Seasonal distribution of imported and domestic cantaloups

As new areas in the United States have either entered or increased production and as imports have increased in recent years, cantaloups are now available in virtually every month of the year. About 75-80 percent of the total supply (unloads) is shipped during the peak period June-August. In the months preceding the peak period, January-May, about 8 percent of the supply is shipped. and shipments in these months consist principally of imports from Mexico and the initial harvestings from southern California, Arizona, and Texas. In the months following the peak period, September-December, about 15 percent of the total supplies are shipped, principally from the late-growing areas in the United States. In table 6 there is shown in carlot equivalents the unloads of cantaloups by origin and weeks in 38 major markets, in 1959 and 1960.1/Comparable data representing daily shipments, by origin, for the months of May and June are shown in table 7. The year 1959 was representative with respect to the maturity and distribution of both domestic and imported cantaloups. In 1960, however, the early domestic crops and imports of cantaloups were delayed by adverse weather and unloads and shipments continued over a somewhat longer period than was customary in earlier years.

^{1/} Unload data represent about 50 percent of total domestic production and about 90 percent of total imports.

In 1959, cantaloups from the southern California desert valleys first appeared on the market in significant quantities in the third week of May, by which time almost 75 percent of the total unloads from Mexico had already been marketed. In that week 104 carlots of California cantaloups and 246 carlots of Mexican cantaloups were unloaded, and in the following week (the fourth) 306 carlots of California cantaloups and 172 carlots of Mexican cantaloups were marketed. Thus, before the fifth week of May 94 percent of the total imports from Mexico had been marketed but only about 10 percent of the total unloads from the desert valleys and a little more than 3 percent of the total unloads from California. Very few of the cantaloups produced during spring elsewhere in the United States (Arizona, Texas, and Florida) entered the market in volume until imports from Mexico had virtually ceased.

As noted above, imports during 1960 from Mexico as well as early shipments from California, were delayed by adverse weather. Unloads from the desert valleys did not approach significant quantities (215 carlots) until the fourth week of May and by that time 74 percent of the imports from Mexico had been marketed. In the first week of June unloads of imports amounted to 283 carlots from Mexico; domestic unloads in that week were 548 carlots from the desert valleys and 393 carlots from Arizona. In the second week of June, unloads from Arizona exceeded 1,100 carlots, but imports from Mexico declined to less than 100 carlots and thereafter were negligible.

Thus in both 1959 and 1960 the bulk of the imports of cantaloups had already entered before domestic marketings began in volume and therefore the resultant overlap period could have had only minimal effect. In 1959 the overlap period (when significant quantities of imported and domestic cantaloup were being marketed) occurred during the middle weeks of May, and in 1960 it occurred during the last two weeks of May and the first week of June.

Table 7 shows comparable data on the basis of daily shipments.

Again it may be noted that domestic shipments have been sparse during the first half of May, at which time imports generally predominate in the market. As in the previous table, it is again shown that the overlap period for shipments of domestic and imported cantaloups has not exceeded 2 to 3 weeks and that the rapid buildup of domestic shipments is accompanied by a rapid diminution of imports of cantaloups. In 1959, this occurred toward the end of May and in 1960 after the first few days of June.

Distribution of domestic and imported cantaloups by markets

As indicated earlier in this report, such competition as there is from imports of cantaloups generally occurs in May, and only in 1960 has such competition extended on into June. An analysis of unloads at 22 principal markets by State of origin and from Mexico, during May and June 1959 is shown in table 8. Of the 986 carlots entering from Mexico in May 1959, 80 percent were distributed to eastern markets in the United States (Chicago east). Of the 511 cars of domestic cantaloups (principally from California), less than one-fourth were distributed to the eastern markets.

Of the 119 cars of Mexican cantaloups entered in June 1959, 111 were unloaded at eastern markets. In that same month unloads from domestic sources (principally California and Arizona) amounted to more than 7,000 cars, of which more than three-fifths were distributed to eastern markets.

Methods of marketing

Methods of marketing the domestic cantaloup crop vary widely from area to area and within each area and may depend upon custom, financial resources of the grower or shipper, proximity of markets, and the type of outlet to be utilized at the market for disposition of the crop. The number of alternative outlets available to cantaloup producers has diminished in recent years as buying power has become increasingly concentrated in the few nationwide chains that prefer to purchase their supplies f.o.b. shipping point. Thus, there has been a diminution in the volume of cantaloups sold through commission houses and brokers.

A significant portion of the cantaloup crop (including imported cantaloups) may be considered "captive" production. Such production occurs most commonly when terminal-market operators or shippers finance in whole or in part the growing of the cantaloups.

A portion of the crop is also sold on a delivered-price basis—
such price to be determined by the existing price at the market
outlet utilized. In States other then California and Arizona sizable
portions of the crop are also sold to truckers at the point of production.

Prices

The cantaloups that arrive at the market early in the season characteristically sell at prices significantly higher than those prevailing later in the season, when the supply is very much greater. Since imports arrive on the market a few months earlier than the first domestic cantaloups, which do not reach the market until late April or early May, the first imports sell at the relatively high early season prices that would otherwise be received for the initial shipments of domestic cantaloups. It is to be noted, however, that the demand for cantaloups selling at these high first-of-season prices is limited, sales in this season being confined to a relatively small volume going chiefly to the institutional trade, such as hotels and high-class restaurants.

It is obvious, of course, that the early season prices of domestic melons are lower in relation to the midseason prices of such melons than they would be in the absence of imports, but the volume of domestic production that is sold in competition with imports is exceedingly small. By far the largest share of domestic production is sold after imports have left the market altogether and hence is not affected by import competition.

Table 9 shows weekly wholesale market prices of imported and domestic melons at representative domestic markets for the years 1959 and 1960. The data represent typical price quotations for the periods shown and exclude quotations for melons of exceptionally high or unusually low quality or for those in poor condition.

In 1959, for example, cantaloups opened at wholesale in New York in the fourth week of January at \$19 per crate (table 9). This was the highest price of the year and, as would be expected, the supply on the market was small -- only 3 carlots reported for that week in the major markets (table 6). Wholesale market prices gradually declined through February, March, and April as the volume of imported cantaloups increased. The first marketing of domestic cantaloups in 1959 consisted of 1 car of California desert valley melons in the third week of April. In that week 218 cars of Mexican cantaloups were unloaded, and the New York midweek price for cantaloups of good quality and condition was \$14.75 per crate. In the third week in May, domestic marketings totaled 113 cars, imports were 246 cars, and the New York price was \$13.50 per crate. After that time, domestic marketings increased rapidly and imports dropped off. In the second week of June, there were 2,349 cars of domestic cantaloups unloaded, compared with 1 car of imports, and the New York price was \$7.50 per crate. During the period of continued heavy domestic marketings in July and August, New York prices advanced slightly from the June low of \$6 per crate, ranging from \$7.10 to \$9.75 per crate.

Terminal market prices at Chicago, San Francisco, and Los Angeles generally follow the trend of the New York market but reflect the lower shipping charges from grower to market.

Shipping-point prices (i.e. prices at the point of origin) for domestic melons experience the same rapid decline with increased domestic marketings in late May as terminal-market prices do. With domestic marketings of 24 cars on May 18, 1959, the El Centro, Calif., shipping-point price was \$11 per crate (table 7). Two weeks later, on June 1, domestic shipments totaled 339 cars, and the shipping-point price was \$5 per crate. Imports on May 18 were 27 cars and on June 1, 12 cars.

Aside from the fact that spring marketings of both imported and domestic cantaloups were a week or two later in 1960 than in 1959, there was little difference in the seasonal trend of prices and the volume of marketings in the two seasons.

Summary

The information obtained in this investigation shows that while acreage, and yield, and the value of the annual cantaloup crop varies from area to area, total U.S. production and the total value of the crop have been fairly stable in recent years; that declines in production in areas such as the Imperial Valley were principally due to increased competition from other domestic areas such as Yuma, and from uneconomical yields resulting from cantaloup diseases; that the average unit value received by growers in 1960 was higher than that in 8 of the last 13 years, the same as that in 1 year, and only

slightly less than that in 3 other years; that there is no indication of a downward trend in employment or sales; that although U.S. imports have been increasing, such imports were equivalent to only 6 percent of U.S. production in 1960; that three-fifths to three-fourths of the imports are entered before domestic shipments become significant; that the overlap of the period of imports with that of significant domestic production usually does not exceed 2 weeks; that as soon as domestic production reaches significant volume, imports diminish rapidly; that the seasonal decline in prices for domestic cantaloups results from volume shipments of such melons rather than from imports and that the prices prevailing when most of the domestic crop is marketed are not sufficiently high to attract imports.

In view of the foregoing considerations, the Commission concludes that cantaloups are not being imported into the United States in such increased quantities as to cause or threaten serious injury to the domestic industry concerned and that, therefore, no sufficient reason exists for a recommendation to the President under the provisions of section 7 of the Trade Agreements Extension Act of 1951, as amended. The Commission observes further that its decision would be no different even if it regarded the industry in question as producing only spring cantaloups.

^{1/} Excludes California Persians.
2/ Classified as "Melons, other than watermelons," but known to be mostly cantaloups.
3/ The ratio of the quantity of imports to production in 1948 was less than 0.05 percent; in the other years shown the ratio was as follows (in percent):

1949 0.6	1952 0.6	1955 2.9	1958 3.5
19506	1953 1.1	1956 4.3	1959 4.5
19514	1954 2.3	1957 4.6	1960 6.4

^{4/} Preliminary.
5/ Value of imports is foreign value.

Source: Production, compiled from official statistics of the U.S. Department of Agriculture; imports and exports, compiled from official statistics of the U.S. Department of Commerce.
